Printing on Parallel Connections Using Raw Protocol - The Color LaserWriter 12/600 PS printer does not support the Raw protocol on parallel connections.

Using the Apple Printer Utility with FaxWorks - The Apple Printer Utility may be incompatible with FaxWorks. The symptom that may appear is a General Protection Fault in the FaxWorks communication driver, FX-COMM.DRV. Using the default Microsoft communication driver (COMM.DRV) appears to solve the problem. To use

the Microsoft COMM.DRV edit the SYSTEM.INI file. Change the line
"comm.drv=fx-comm.drv" to "comm.drv=comm.drv", save and close the file, and then
restart your system.

LaserWriter Software For Windows: Read Me File (2 of 2) (10/95)

=====

Article Created: 10 October 1995

TOPIC -----

This article contains the ReadMe file included with the LaserWriter Software For Windows version 1.1 posted online. This is part 2 of 2 of the document.

DISCUSSION -----

ABOUT YOUR APPLE LASERWRITER PRINTER SOFTWARE FOR WINDOWS
Revision 1.1

Revision 1.1 of the Apple LaserWriter Printer software for Windows 3.1 contains updated versions of these components:

••In part 1 of 2••

- Installer
- Apple Printer Utility
- Bidirectional driver

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference. You'll find information about:

- Installing the Printer Driver Software
- Installing additional PostScript printers
- Configuring the PostScript printer
- Deleting previous versions of the printer driver
- Installing the printer description on Windows NT 3.5
- Using the Apple Color LaserWriter 12/600 PS Printer
- Obtaining Printer Supplies for the Apple Color LaserWriter 12/600 PS
- Apple Printer Utility 2.0

••In part 2 of 2••

- AdobePS Printer Driver version 3.0
 - General driver compatibility issues
 - General font downloader compatibility issues
 - Application software compatibility issues

ADOBEPS PRINTER DRIVER 3.0.1

=====

COLOR LASERWRITER 12/600 PS COMMUNICATION SWITCH

The ADOBEPS printer driver is configured by default for binary communications. Send Data in Binary on the PostScript Setup tab dialog is turned on by default.

The communication switch for the Color LaserWriter 12/600 PS is located on the back of the printer. The printer is shipped from the factory with the switch in the right or "Custom" position. Should the switch be reset to factory defaults by moving it to the left or "Reset" position and then back to the Custom position, the communications protocol for the printer's parallel port is incorrectly changed to ASCII. Because of this, print jobs sent from the AdobePS driver with Send Data in Binary turned on will not print.

To correct this problem, you can turn Send Data in Binary off. Alternatively, you can use the Apple Printer Utility to set the protocol back to binary (TBCP). To do this:

Step 1

Open the Apple LaserWriter Software folder, double-click the Apple Printer Utility, and select the desired printer.

Step 2

Select the Communication Configuration panel and then select Port Configuration. For the Protocol field, select TBCP. Then, press Send. The printer's protocol should now be set to binary (TBCP).

Step 3

This procedure must be performed each time the communication switch is reset.

GENERAL DRIVER COMPATIBILITY ISSUES

=====

Windows 3.0 - This version of AdobePS does not support Windows 3.0.

Installation - When installing the driver or a printer PPD, you must first exit all applications using this driver or the Printers dialog in the Control Panel will not proceed with the installation.

Interaction With Control Panel Printers Dialog Box - Some selections made in the

Printers dialog box, such as Set as Default Printer and Connect, take effect only after the Printers dialog box is closed.

Duplicate Features in the Driver and Application - If your application contains the same feature as the driver (such as scaling or number of copies), use your application to set the feature; do not set it using the driver. Use the driver tab dialogs only to set printer options you cannot control via your application's Print or Print Setup dialog box.

Printing From Multiple Applications - Multiple applications cannot use AdobePS 3 at the same time. You can print from multiple applications, but must wait until a job has completed before starting another one.

Image Printing Performance - For some applications, printing images may be slower than expected. Printing performance will depend on bitmap characteristics (such as size or color) and the method the application uses to print bitmaps. For example, 24-bit color images will print more slowly than 1-bit black-and-white images.

PostScript Protocol Options - For the printer's default configuration, protocol options located on the PostScript tab dialog should be set to Default. For the Color LaserWriter 12/600 PS you should be able to select Send Data in Binary for both parallel and network connections.

Optimize for Speed vs. Optimize for Portability - On the PostScript tab dialog, there is a group box called PostScript Performance. When you select Optimize for Speed, you may find certain jobs cause the printer to run out of memory, terminating the job with a VM or rangecheck error. If you encounter problems, try setting the PostScript Performance option to Optimize for Portability.

Downloadable Fonts - Printing lengthy documents that require the driver to download several fonts may generate one or more of the following error messages or conditions:

PostScript Error: limit check

PostScript Error: VM error

Page with the message that the printer has insufficient memory

Printer simply does not finish printing the job or resets.

Workarounds: Try one of the following:

- 1) Reduce the number of fonts in the document.
- 2) Try changing the PostScript Performance setting on the PostScript tab dialog to Optimize for Portability.
- 3) Add memory to the printer.

Do Not Download Fonts Option - The Job Control tab dialog contains the Font Control option Do Not Download Fonts. Use this option only if you know that the fonts that you use in your documents are always available to your printer, for example, via the hard disk attached to your printer. Otherwise, the printer may

substitute Courier for your fonts.

Document Structuring Conventions - AdobePS 3 does not emit the DSC comments
"%%BeginData ... %%EndData."

Some Images Print With Limited Color - Images based on RLE-4 and RLE-8
compression print with limited halftoning effects. Typically, shades of gray or
color will print as either black or white.

Installation of Printer Font Metrics - The list of characters available in a
font has changed from Windows 3.0 to Windows 3.1. AdobePS 3 uses the information
in Printer Font Metric (PFM) files to help applications lay out text correctly
and to instruct PostScript printers how to print text correctly. However,
because of the changes in characters available, some older PFMs may incorrectly
list character widths and cause either errors in layout of text on the screen,
in the printer, or both. AdobePS 3 includes the newest versions of font PFMs
for all of the printers it installs.

If Adobe Type Manager (ATM) is installed it includes PFMs for fonts on the
printer. AdobePS 3 assumes that those PFMs are more up to date than the PFMs
included during driver installation.

If you suspect that your ATM fonts are incorrect, you can force AdobePS 3 to use
its own PFMs by following these steps:

Step 1

Use Notepad to edit a line similar to PFM_Dir=c:\psfonts\pfm in the [Setup]
section of the ATM.INI file to read as follows:

```
;PFM_Dir=c:\psfonts\pfm
```

Step 2

Save the modified ATM.INI file.

Step 3

Proceed to install a new printer using the Printers dialog box in the Control
Panel.

Step 4

Restore the line in ATM.INI to its previous value.

Interaction with Adobe Type Manager - Certain applications may pass inaccurate
font information to Adobe Type Manager, causing it to abort. To work-around this
problem, double-click the ATM Control Panel, select the On or Off option, and
choose Exit. Restart Windows for the change to take effect. Then, try the
application again.

Removing Adobe Type Manager from Your System -In rare instances you may want to

remove ATM from your system. Follow these steps:

Step 1

Use the ATM Control Panel to remove Type 1 fonts from your system.

Step 2

Use Notepad or another text-editing accessory to open the SYSTEM.INI file in your Windows directory

Step 3

Replace the following two lines:

```
system.drv=atmsys.drv
```

```
atm.system.drv=system.drv
```

with this line:

```
system.drv=system.drv
```

The first two lines might vary on some systems. The replacement line, however, should be as shown above.

Step 4

Quit Notepad and exit Windows. Delete ATM16.DLL, ATM32.DLL, and the ATMSYS.DRV files from your Windows\System directory. Delete the ATM.INI and ATMCNTRL.EXE files from your Windows directory.

Step 5

Delete the .PFM and .PFB files from your Windows\psfonts directory. Delete the ATMFONTS.QLC file from your Windows\psfonts directory. Restart Windows.

Some Printers Reset When Sent Binary Mode Commands - The Apple Color LaserWriter 12/600 PS supports Tagged Binary Communications Protocol which is a superset of the Adobe Binary Communications Protocol. It does not support the Adobe Binary Communications Protocol (BCP) and may reset if sent the command to switch into binary mode (requested via the Job Control tab dialog, using Printer Mode, Send Mode). This happens only if you are using the incorrect PPD for your particular printer. To avoid this situation, install the correct PPD for your installed printer.

Using Print Manager - Windows Print Manager will create a temporary file when you print from an application. Deleting this temporary file terminates the print job.

Suggested use: Click Cancel from the dialog box to terminate the print job or delete from within Print Manager.

Custom Paper Dimensions - In some PPDs, the minimum width and height values for the Custom Paper option are represented by three decimal digits. AdobePS 3 rounds off the value to two decimal digits, which may result in an error indicating that one or both of your dimensions are invalid.

Workaround: If you wish to use the minimum value, change the AdobePS 3 rounded value (such as 8.26) to the exact value of the dimension with all decimal digits (such as 8.264).

Page Preview Image - The Page Preview image on the Paper tab dialog reflects only an approximation of the actual printed page. Paper size, color, and border filling in the page preview, for example, may not accurately represent the corresponding characteristic of the printed page.

Watermark Printing - In some applications, watermarks will print either in the background (the default) or in the foreground, but not in both.

Workaround: Try printing the watermarks in both the foreground and background to discover which location works best with your application and printed document.

Watermarks are enabled using the Forms capability in all Adobe PostScript Level 2 printers and will not print if sent to a PostScript Level 1 printer.

Workaround: Send jobs specifying watermarks to a PostScript Level 2 printer.

When you specify a watermark to print in outline format, the Page Preview image of the Watermark and Paper tab dialogs do not display the outline watermark. This is a limitation of the driver's display feature only; the watermark will print correctly on the physical page.

In some applications, when the Watermark First Page Only feature and Number of Copies features are combined, the watermark prints only on the first page of the first copy.

Workaround: Print each copy as a separate job.

Some applications submit the entire print job as one logical page. The single logical page, when printed, spans multiple physical pages. For such applications the watermark may appear only on the second physical page.

N-Up Printing - N-up printing may yield unanticipated results when you combine layout and orientation page-setup options in one document. The first logical page of a job determines the layout for the rest of the job. For example, if you choose portrait orientation for the first page of a document printed in 6-up, all pages in the document will print in the standard order for portrait orientation, left to right, top to bottom, even if you change to landscape orientation in the middle of the job. If you specify landscape orientation for the first page of a 6-up document, all document pages print bottom to top, left to right. For rotated landscape orientation, document pages print top to bottom, right to left.

Additionally, if you request a different resolution, page size, or paper source,

or if you request duplex settings for different pages of a document while using the n-up feature, AdobePS 3 completes the previous request and then starts a new page, applying the currently requested page-setup settings. The order of the layout remains the same, although virtual pages of an n-up layout will be blank.

This is because AdobePS 3 starts the next set of instructions on a new sheet of paper.

In some applications, when the Layout and Copies features are combined, new pages are started, as needed, only in the first copy.

Workaround: Print each copy as a separate job.

N-up printing and borders - You may experience problems printing documents that have borders when printed with n-up printing.

Workaround: Print documents with borders with 1 page per sheet of paper.

N-up printing and manually downloaded PostScript header - With some applications, manually downloading a PostScript header may cause errors when n-up printing is used.

Workaround: Instead of manually downloading the PostScript header, select "Send Header with each job" in the driver's Job Control tab dialog.

Dialog Box Warning: Application Incompatibility Watermark and N-Up Features - Some applications are incompatible with watermark and page layout (n-up) features. If this is true for an application you are using, AdobePS 3 displays the Application/Printer Setup Incompatibility dialog box, which lets you cancel the print job, try to print using the driver's features, or print without using the driver's features. By default, AdobePS 3 displays this dialog box each time you send a print job specifying features with which the application is incompatible. If this is an inconvenience for you, you can disable the dialog box.

To disable the Application/Printer Setup Incompatibility dialog box:

Step 1

Use Notepad or another ASCII text editor to open the WIN.INI file and go to the [AdobePS] section.

Step 2

Choose one of two options:

- * Find the line "Show Compatibility Alert=1" and change the value from 1 to 0.
- * If the Show Compatibility Alert line does not exist, add the line "Show Compatibility Alert=0."

Step 3

Save and close the file.

Problems Printing Envelope and Document in a Single Job - The Apple Color

LaserWriter 12/600 PS printer does not support envelopes. With other printers, when you print an envelope-and-letter job involving paper source changes, if the first page uses the manual-feed paper tray and the next page changes to Auto Tray Select, printing may yield unexpected results. For example, envelope text may be printed on letter-size paper instead of the expected envelope.

Workaround: Specify specific paper sources instead of Auto Tray Select, or print each page as a separate job.

Problems Printing to Printers in Adobe IntelliSelect (AIS) Mode - A Printer Mode value of ASCII Mode, set via the Job Control tab dialog, is incompatible with printers in AIS mode and results in an error. Also, files with embedded EPS graphics or text created via drivers other than AdobePS 3 may not print correctly to a printer in AIS mode.

Workaround: If your printer has a front panel, change from AIS mode to standard PostScript or TBCP and then reprint the job. Or, do not choose Send Mode and use only the printer's default mode.

Full-Color Bitmap Printing Performance - When you select the PostScript option Send Full Color Data and are using 24-bit color images, AdobePS 3 sends the full image data to the printer. You may not need this data for printers that are unable to render 24-bit color images. However, selecting this option allows the printer's halftoning capabilities to be used to their greatest extent to print the best possible image.

Alternative: If improved performance is more important than accurate color halftoning, turn off the Send Full Color Data option.

Accidentally Printing EPS Files - If a printer driver is accidentally configured to print EPS output to a printer rather than a file, AdobePS 3 displays a warning that EPS should not be output to a port; the job prints correctly within the application, then the printer stays in a waiting mode until either (a) another job is sent, or (b) a time-out error occurs. To avoid this situation, ensure that EPS format is only output to File, not Printer.

Font Installation - The presence of fonts installed by some font installers may not be recognized.

Workaround: To notify the driver of fonts installed by non-Adobe font installers, manually update the ATM.INI file. For more information, see the Adobe ATM user guide.

Match Color Across Printers Option - The Match Color Across Printers option uses the device-independent color-rendering feature available in PostScript Level 2 color printers to render color output as close as possible to the colors of other Level 2 printers. This feature is intended to give accurate and consistent color rendering across a wide range of color devices.

GENERAL FONT DOWNLOADER COMPATIBILITY ISSUES

=====

The Font Downloader is automatically installed along with the driver. Although

the downloader can be run as a stand-alone program, this is not recommended.

Downloading Task Thermometer - The task-progress thermometer does not always reflect the true status of the font downloading task. Even though the font does download, the thermometer may not reflect 100%.

TrueType fonts - TrueType fonts cannot be downloaded with the Font Downloader.

Downloading PostScript Files Containing Binary Data - The Font Downloader can download only PostScript files containing ASCII data and may display an error if the PostScript file contains binary data.

Workaround: In the PostScript tab dialog, turn off the Send Data in Binary option in the Performance Options box, and redownload the PostScript file. Or, do not use the Font Downloader; instead, send PostScript files containing binary data to the printer from DOS using the Copy command.

Device Installer Problems - Sometimes the Font Downloader does not let you delete installed devices, does not properly display newly installed devices in the device list box, or continues to list fonts previously deleted. In addition, the Font Downloader cannot verify that a device is installed correctly. If you're not sure, check the Color LaserWriter's startup page to see if the device name is listed. See chapter 5 of your user guide to verify that the hard disk has been installed correctly.

Workaround: Exit completely from the driver. Reenter the program via the Setup button of the Printers dialog box; choose the Fonts tab dialog; click the Font Downloader button, and the Font Downloader dialog box appears. Click Device Installer. The newly installed devices should now appear. To delete a device, highlight it, and choose Remove.

Deleting Fonts From the Printer's Memory - If you have downloaded fonts to the printer's memory using the Font Downloader, the fonts stay resident until the printer is restarted; the Font Downloader does not delete fonts from the printer's memory.

Workaround: Restart the printer using the Apple Printer Utility or turn the printer off, wait a few moments, and then turn the printer back on.

Update of WIN.INI File - The Font Downloader does not update the WIN.INI file to reflect the fonts that it has downloaded; therefore, other PostScript drivers or application programs that read WIN.INI for information updates will not know which fonts have already been downloaded.

Misleading Memory Messages - Sometimes when you are downloading a group of fonts, the Font Downloader sends messages indicating that there may not be enough available memory to download the individual font. This message may or may not reflect the true state of your printer.

Workaround: If you know your printer has plenty of memory, choose Yes in response to the Font Downloader message and continue downloading the fonts. Also, to avoid display of the insufficient memory message, download the fonts individually, not by group. If your printer is low in memory, you may not be

able to download all fonts to it.

Check Password - Check Password is not supported for Apple printers.

Workaround: NetWare security is available for the Apple Color LaserWriter 12/600 PS when it is used as a print server. You set up the password on the NetWare file server and on the printer being used as the print server. See Chapter 3, sections "Assigning a password for the print server" and "Setting additional parameters with the Apple Printer Utility for Windows" of the Apple Color LaserWriter 12/600 PS User Manual.

APPLICATION SOFTWARE COMPATIBILITY ISSUES

=====

Adobe Illustrator

If you install Adobe Illustrator after the Adobe PostScript driver, the following message may appear: "The file C:\WINDOWS\SYSTEM\PS_ENUM.DLL already exists and has a different date than the file Illustrator is about to install. Do you wish to overwrite the current file on the system?"

Select No; do not overwrite the file.

This same dialog will again appear for RUN_ENUM.EXE. Select No; do not overwrite this file, either.

If Illustrator has been installed without regard to the above instructions, reinstall the driver using the instructions listed in "Deleting Previous Versions of the Driver." You must clear all previous files to ensure a successful installation.

Aldus Freehand

Aldus Freehand does not support the Rotated Landscape Orientation option of the Paper tab dialog. In addition, Freehand does not support watermarks.

Ashlar Vellum 2.12

Ashlar Vellum does not support printing multiple copies.

CorelDraw 5.0

Printing watermarks with First Page Only selected causes the watermark to print only on the last page.

Workaround: Print page one only with the watermark selected. Then, print the remainder of the document without the watermark.

Fractal Design Painter 2.0

In the PostScript tab dialog is a group box called PostScript Performance. Fractal Design Painter 2.0 is compatible only with the Optimize for Portability option of that box.

Freelance Graphics 2.01

Print jobs may not scale correctly.

Micrografx ABC FlowCharter 3.0

In documents over seven pages long, letters might print superimposed upon each other. This problem seems to occur on printers with a resolution of 600dpi or higher.

Workaround: Print to a printer with a resolution lower than 600 dpi.

Micrografx Designer 4.0

AdobePS 3 does not support the Colored Pattern Brush feature of Designer 4.0 and the earlier application Charisma and prints filled areas of color bitmaps in black and white.

MS Excel

Printers with resolutions in excess of 300dpi may exhibit uneven patterning in graphics using color fill patterns.

MS Notepad and Cardfile

Resolution of 600dpi or above may cause Notepad and Cardfile to print with incorrect margins. Sometimes this can be corrected by specifically changing the requested margins from 0.75", the default margins, to another value; this does not always fix the problem.

Workaround: Most printers with resolution above 600dpi have lower resolution modes; if so, select a lower resolution in the printer's Print Setup, Setup, Features tab dialog. If not, install the Adobe Default Printer and select it when printing from Cardfile or Notepad.

MS Online

Microsoft Online may not print when AdobePS 3 is selected and the printer name is longer than 29 characters.

Workaround: Choose a printer name with fewer than 30 characters.

MS PowerPoint 3.0

Resolution changes requested from within the PowerPoint 3.0 Print Setup dialog box do not take effect.

Workaround: For printers that allow control of their resolution, use the AdobePS 3 Features tab dialog to change resolution in your PowerPoint 3.0 files.

When printing some colored text from PowerPoint 3.0, the text prints in black

rather than the selected color.

MS PowerPoint 4.0

Printing files containing multiple embedded EPS objects from this application sometimes results in either lost text or lost EPS objects.

Workaround: Convert the embedded EPS objects to PowerPoint objects by double-clicking on them.

MS Publisher 2.0

The BorderArt feature of MS Publisher 2.0 is incompatible with AdobePS 3. If you try to use this feature with AdobePS 3, the printed file may be missing lines from the upper and bottom right and left corners of the border.

PageMaker

AdobePS 3 is incompatible with PageMaker 5.0 or earlier if you are using a PJL printer.

Workaround: Upgrade to the latest version of PageMaker if you are using a PJL printer.

Some PageMaker files may print with unexpected results.

Workaround: Make sure that you have selected the correct type of printer in the PageMaker print dialog box and that the PageMaker private PPD directory contains the correct PPD for the printer you are using.

Persuasion 3.0

Depending on the file you are trying to print, Persuasion 3.0 is sometimes incompatible with AdobePS 3. Printing sometimes results in a blank first page or a PostScript error.

Quicken 3.0

If you choose to print partial checks in 1s or 2s, instead of the standard 3s, you may get unexpected results. When you request partial check printing, Quicken prints a blank first page, a second page in portrait orientation, and a third page in landscape orientation.

WordPerfect 5.1

Early versions of WordPerfect may exhibit some problems with this driver. Examples include: unreadable text in the WordPerfect Select Printers dialog; dimmed Select control in the Select Printers dialog when switching printers; and mismatched settings between AdobePS 3 and WordPerfect.

Workaround: Use at least version 5.1 of WordPerfect.

PowerBook 5300 & 190 Series: Internal & External Video (5/96)

Revised: 5/30/96
Security: Everyone

PowerBook 5300 & 190 Series: Internal & External Video (5/96)

Article Created: 10 October 1995
Article Reviewed/Updated: 30 May 1996

TOPIC -----

This article answers some commonly asked questions about the internal and external video capabilities of the Macintosh PowerBook 190 and 5300 series computers.

How do I connect an external display to a Macintosh PowerBook 190 or 5300 series computer?

When an external monitor is connected can I still run the computer from the battery?

Can I expand the Video RAM (VRAM) in these PowerBook computers?

What is the highest bit depth the Macintosh PowerBook 5300 series computers are capable of using with an external monitor attached?

Which Apple Macintosh displays can I use with these PowerBook computers? And what resolutions can these PowerBook computers output to them?

DISCUSSION -----

Connecting An External Display

5300 Series

The PowerBook 5300 series computers have the same type VID-14 video output connector as the earlier PowerBook 500 series computers. This adaptor cable will be needed to connect an external display. The Apple part number for the cable is M3927LL/A*. The PowerBook Video Adaptor cable is not included with the

PowerBook 5300 computers.

190 Series

The PowerBook 190 series computers can be upgraded to have the same video out capabilities that are built into the PowerBook 5300 series computers. You need to order the Macintosh PowerBook 8-Bit Color Video-Out Upgrade Kit (Apple part number M3743LL/A*) to get video out capability. You will use the same video cable mentioned above to attach an external display. The PowerBook Video Adaptor cable is not included with the PowerBook 190 computers. The PowerBook Video Adaptor cable is included in the Macintosh PowerBook 8-Bit Color Video-Out Upgrade Kit.

Running From The Battery

Unlike previous PowerBook computer models, the PowerBook 190 (with the video-out upgrade) and 5300 series computers can have an external monitor attached while running from the battery.

VRAM Expansion

=====

All of the PowerBook 5300 and the PowerBook 190 (with the video-out upgrade) series computers have two separate sets of VRAM to support the internal and external displays.

External Display VRAM

All of the PowerBook 5300 and the PowerBook 190 (with the video-out upgrade) series computers have 512K of VRAM soldered on a video card for supporting external displays.

The highest bit depth available for external displays at either 640x480 or 832x624 resolutions is 8 bits per pixel unless you expand the VRAM by replacing the Apple video-out card with a third party video expansion card product. If the VRAM on the third party video card is 1 MB, the computer will be able to output 16 bits per pixel on an external display.

Internal Display VRAM

NOTE: The following descriptions apply only to models sold in the United States. Europe and Asia have models that differ slightly from these configurations.

The Macintosh PowerBook 5300 and 5300cs computers and the 5300c (that comes with 8 MB of RAM) come with 512K VRAM soldered to the logic board for support of the internal LCD Display. It cannot be removed or upgraded.

The Macintosh PowerBook 5300c that comes with 16 MB of RAM on the logic board and the Macintosh PowerBook 5300ce have 1 MB of VRAM. This allows for higher bit depth support on the internal display. It also cannot be removed or upgraded.

Built In Video Support

=====

Internal Video Support

The following table lists the PowerBook 5300 and 190 (with the Apple video-out upgrade) series computer models and the amount of VRAM installed in each for use by the computer's internal display and an external display.

Begin_Table

Part #	Model #	Display Type	No. Colors on Int. Disp.	VRAM for Int. Disp	VRAM for Ext. Disp
-----	-----	-----	-----	-----	-----
M3135LL/A* (8 MB RAM 500 MB HD)	5300/100	9.5 inch Passive Matrix Grayscale	16 Grays	512K	512K
M3825LL/A* (8 MB RAM 500 MB HD)	5300cs/100	10.4 inch Dual Scan Passive Matrix Color	256 Colors	512K	512K
M3824LL/A* (16 MB RAM 750 MB HD)	5300cs/100	10.4 inch Dual Scan Passive Matrix Color	256 Colors	512K	512K
M3133LL/A* (8 MB RAM 500 MB HD)	5300c/100	10.4 inch Active Matrix Color	256 Colors•	512K	512K
•Note: This model displays thousands of colors, but only in the reduced screen size mode (640x400).					
M4488LL/A* (16 MB RAM 750 MB HD)	5300c/100	10.4 inch Active Matrix Color	Thousands of Colors	1 MB	512K
M3828LL/A* (32 MB RAM 1.1 GB HD)	5300ce/117	10.4 inch Active Matrix Color	Thousands of Colors	1 MB	512K
M3530LL/A* (4 MB RAM 500 MB HD)	190/66	9.5 inch Backlit Passive Matrix Grayscale	16 Grays	512K	512K (with video card upgrd)
M3531LL/A* (8 MB RAM 500 MB HD)	190/66	9.5 inch Backlit Passive Matrix Grayscale	16 Grays	512K	512K (with video card upgrd)
M4072LL/A*	190cs/66	10.4 inch	256 Colors	512K	512K

(4 MB RAM 500 MB HD)	Dual Scan Passive Matrix Color	(with video card upgrd)
M4073LL/A* 190cs/66 (8 MB RAM 500 MB HD)	10.4 inch Dual Scan Passive Matrix Color	256 Colors 512K 512K (with video card upgrd)

External Video Support

The following table lists the Apple Displays supported by the Macintosh PowerBook 5300 and 190 (with the Apple video-out upgrade) series computers and the bit depths supported with the standard 512K of VRAM installed.

Display	Resolution(HxV)	Bits/Pixel
-----	-----	-----
Macintosh 12-in. RGB Display	512x384	1-8bpp
Macintosh 12-in. Monochrome Display	640x480	1-8bpp
AppleColor High Resolution RGB Monitor (13-in.)	640x480	1-8bpp
All Apple 14-in. displays including the AudioVision (with adaptor)	640x480	1-8bpp
Macintosh Portrait Display	640x870	1-4bpp
Macintosh Portrait Display	640x818	1-8bpp
Macintosh 16-in. Color Display	832x624	1-8bpp
Apple Multiple Scan 15 display	640x480 832x624	1-8bpp 1-8bpp
Apple Multiple Scan 17 display	640x480 832x624 1024x768	1-8bpp 1-8bpp 1-4bpp***
Apple Multiple Scan 20 display	640x480 832x624 1024x768	1-8bpp 1-8bpp 1-4bpp***
VGA (60 Hz)	640x480	1-8bpp**
SuperVGA (56 Hz)	800x600	1-8bpp**
VESA 1024x768 (60 Hz)	1024x768	1-4bpp***

End_Table

Note: The resolutions and bits/pixel may be different with a third party video card. For more information you will need to contact the manufacturer of your video card.

* Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

** VGA and SVGA Monitors require special third-party VGA cables.

*** This is an unsupported resolution. It can only be obtained by holding down the Option key when pressing the Option button in the Monitors Control Panel. It may or may not be an available option in future revisions of the Monitors Control Panel.

Desktop Manager and Desktop Databases: What are they? (10/95)

Revised: 10/11/95
Security: Everyone

Desktop Manager and Desktop Databases: What are they? (10/95)

=====

Article Created: 11 October 1995

TOPIC -----

This article describes the history of the Desktop Manager and Desktop DB files. It also discusses the use and support of the Desktop Manager extension.

DISCUSSION -----

In the early days of the Macintosh operating system, new objects like icons and windows had to be stored and managed somewhere by the operating system. Information such as the bit mapped representation of the icon picture to display and the association of documents to the application that created them was saved in a database. This file was called "Desktop" and was an invisible file at the top level of every diskette. Information was placed in this file by the action of the Finder making calls to the Desktop Manager. The Desktop Manager, in turn, made calls to the Resource Manager, creating resource items within the Desktop file.

When hard drives came into use on the Macintosh and the file system was enhanced with real folders and a hierarchical organization. This became known as the Hierarchical File System (HFS). The Desktop file maintained the same information as before, but became much larger in size since hard drives held many more files and documents.

AppleShare File Servers added the ability for the Macintosh to share larger and larger hard drives. The fast access needs of the file servers began to strain the capabilities of the Resource Manager to maintain the Desktop database. A new database organization was designed for use by the Desktop Manager for use on AppleShare 2.0.x servers. This new Desktop database consisted of two invisible files called "Desktop DB" and "Desktop DF".

These files are of a more modern database design with an index and data file and provide much faster access to information than the original resource based file, especially when the number of files being managed becomes very large. These files are also created at the top level of every volume over 2 Megabytes in

size. Floppy disks kept the original resource based Desktop file, since it is an adequate method for small volumes.

The support of the internal interface for the new Desktop Manager database routines under System 6 was implemented as an extension on AppleShare Servers called Desktop Manager. Many users who owned the AppleShare 2.0.x product ran with this extension on their client computer with System 6 to help manage their growing file systems on large hard drives. This use of the Desktop Manager extension was never a supported or approved configuration by Apple outside of the AppleShare Server environment.

This new desktop database design was integrated into System 7 and is still in current use. In the early transition days from System 6 to System 7, many users were using the Desktop Manager extension from AppleShare with non-server computers because they found that when switching back and forth between System 6 and System 7, it would prevent a Desktop rebuild from occurring. This extension was enabling the same desktop files to be shared between the two different versions of the Mac OS. This was an untested and unsupported configuration that seemed to work for those who tried it.

Macintosh Easy Open: Keeps Opening the Wrong Application (10/95)

Revised: 10/11/95
Security: Everyone

Macintosh Easy Open: Keeps Opening the Wrong Application (10/95)

=====

Article Created: 11 October 1995

TOPIC -----

When I attempted to open a file, Macintosh Easy Open appeared and provided a list of applications which I could use to open this file. I accidentally selected the wrong application. Now, each time I attempt to open the file, the wrong application is launched. Is there a way to reset this so that the wrong application will not be launched?

DISCUSSION -----

After selecting the wrong application to open a particular file, you will need to delete Macintosh Easy Open's preference file, or the wrong application will remain attached to that file. To delete the preference file, open the Macintosh Easy Open control panel, and click the Delete Preferences button.

After deleting the preference file, you will need to rebuild your desktop file this way:

Step 1

Restart your Macintosh and hold down the Space Bar until the Extensions Manager control panel opens.

Step 2

Use the pull down menu in the Extensions Manager to choose "All Off"

Step 3

Scroll down to the Control Panels section of the Extensions Manager window and click the Macintosh Easy Open item to put a check mark by it.

Step 4

Close the Extensions Manager window by clicking on the close box in the upper left corner.

Step 5

Immediately hold down the Command (Apple) and Option keys until you see the dialog box, "Are you sure you want to rebuild the desktop file?" Click Okay.

Once you have determined everything is working normally, you can go back to the Extensions Manager and turn on all the extensions you usually use. You need to restart to have the reactivated extensions load.

At Ease: Cannot Access Floppy (Drive A) On The DOS Side (10/95)

Revised: 10/25/95
Security: Everyone

At Ease: Cannot Access Floppy (Drive A) On The DOS Side (10/95)

=====

Article Created: 11 October 1995
Article Reviewed/Updated: 25 October 1995

TOPIC -----

We have installed At Ease for Workgroups 3.0 on our PowerMac 6100/DOS compatible computers. At Ease seems to prevent the DOS side from seeing Drive A. If we turn off At Ease, the DOS side can access Drive A just fine.

DISCUSSION -----

At Ease sets the same limitations to floppy disk access on the DOS side as it sets for the Macintosh side. That is, if the At Ease Setup allows accessing and storing files on a floppy disk, then the DOS side can also use the floppy disk in Drive A.

The Full Finder setup has no restriction on the use of floppy disks and either the Macintosh or DOS side can access a floppy disk in Drive A.

In a Restricted Finder setup or At Ease Panels, access to floppies is controlled by the Locations pane that controls where files can be stored or opened.

Follow these steps to allow users to save and/or open documents from a floppy disk while in the At Ease panels:

Security Panel
=====

Step 1

Launch At Ease Setup, open the Setup you want to have access to the floppy drive.

Step 2

Click the Padlock button to go to the Security Panel.

Step 3

In the first section:

For new documents, users are required to use their At Ease Documents folder to:

☐ Open

☐ Save

Click the box to put an x in the Open section if you want your users to be able to open documents. Click the box to put an x in the Save section if you want your users to be able to save documents.

Locations Panel

=====

Step 1

Click the Floppy Disk button to go to the Locations Pane.

Step 2

In the second section:

Store user documents on:

☐ Setup location volume

☐ Floppy Disk

Click the box to put an x next to Setup location volume if you want your users to have access to the At Ease disk. Click the box to put an x next to the Floppy Disk section if you want your users to have access to a floppy disk.

Step 3

Click OK.

WiggleWorks: Story Line Input Limit (10/95)

Revised: 10/11/95
Security: Everyone

WiggleWorks: Story Line Input Limit (10/95)

=====

Article Created: 11 October 1995

TOPIC -----

When I try to input more than three lines of text in the Birds on Stage section of the WiggleWorks program, my computer just beeps instead of taking in any more input.

DISCUSSION -----

The guide that is included with the WiggleWorks CD-ROM disc incorrectly states that you can input up to eight lines of text. The limit is, in fact, 256 characters. There is no dialog box or error message stating that this limit has been exceeded, only a system beep response as you continue to type on the keyboard.

There is no way to type beyond the 256 character limit.

System 7.5.3 and Physical Ethernet Address Change (6/96)

Revised: 9/23/96
Security: Everyone

System 7.5.3 and Physical Ethernet Address Change (6/96)

Article Created: 11 October 1995
Article Reviewed/Updated: 27 June 1996

TOPIC -----

After installing System 7.5 Update 2.0 (System 7.5.3) I noticed the Ethernet hardware address of the computer changed from 00:A0:40:xx:xx:xx to 00:05:02:xx:xx:xx. Why did this occur? Is this due to Open Transport 1.1?

DISCUSSION -----

Apple was initially assigned Ethernet physical (Media Access Control) addresses of 08:00:07:xx:xx:xx. Apple NuBus and on-board Ethernet implementations from 1989 through part of 1995 were given addresses from this range. In 1995, however, Apple began to reach the end of the available addresses in that range, and petitioned the IEEE for an additional vendor code (address range) assignment. We were granted 00:A0:40. Apple began using these new addresses (00:A0:40:xx:xx:xx) in some of our Ethernet implementations in mid-year 1995.

MAC addresses are typically stored in an EPROM (erasable programmable read-only memory) on the Ethernet chip set, in what is known as "Token Ring format". This format has each byte stored in nibble-reversed order. For example:

Begin_Table

Ethernet format (hex):	00	A0	40
Binary equivalent:	0000 0000	1010 0000	0100 0000
Token Ring format (hex):	00	05	02
Binary equivalent:	0000 0000	0000 1010	0000 0010

End_Table

Some Macintosh computers, Power Macintosh 7200, 7500, 8500, and 9500, and some Apple NuBus Ethernet cards, had their MAC address mistakenly stored in Ethernet format; not in the standard Token Ring format. That is, rather than storing the

address as 00:05:02:xx:xx:xx and then converting to yield the assigned address range of 00:A0:40:xx:xx:xx, the addresses were stored as 00:A0:40:xx:xx:xx and would have been converted to 00:05:02:xx:xx:xx.

At the same time, however, there was a bug in the Open Firmware code for Power Macintosh 7200, 7500, 8500, and 9500 computers that caused those systems to NOT convert the address stored in the EPROM. The end result was the correct MAC addresses (00:A0:40:xx:xx:xx) were being used by these Ethernet implementations on the wire, even though they were stored in the incorrect format. (A rare case of "two wrongs do make a right".)

Many Apple and third-party network management utilities also access the EPROM to read the MAC address, and correctly assume it will be stored in Token Ring format. Therefore they convert the stored address before presentation to the user. As a result, such as utility would report an address of 00:05:02:xx:xx:xx, even though a network analyzer packet trace would show an address in the range 00:A0:40.

Apple NuBus Ethernet cards, with MAC addresses in the new range, were more problematic. Because the Open Firmware bug did not affect these cards (Open Firmware is a PCI specific technology), the MAC addresses were converted from 00:A0:40:xx:xx:xx to 00:05:02:xx:xx:xx, resulting in the use of unauthorized addresses on the wire. Fortunately, the 00:05:02 range was still unassigned, and these cards did not create inter-operability problems in the field.

Apple has since petitioned the IEEE and been granted the 00:05:02 range, in addition to the already approved 08:00:07 and 00:A0:40 ranges.

System 7.5 Update 2.0 (System 7.5.3) includes a fix for the Open Firmware bug that impacted the Power Macintosh 7200, 7500, 8500, and 9500 computers. A system with an address stored as 00:A0:40:xx:xx:xx (originally considered improper), once updated to Mac OS System 7.5.3, will now appear as 00:05:02:xx:xx:xx on the wire. This change impacted an Open Firmware component; it is not a part of Open Transport v1.1.

As Apple now has official use of the 00:05:02 range, these PCI Mac OS systems now have properly stored addresses. This brings the behavior of all on-board and NuBus Ethernet implementations back together, and lets Apple and third party utilities correctly report these addresses.

These changes were necessary to assure ongoing standards compliance, and to remedy the unintentional compatibility issues with network management utilities.

This situation may impact networks including the Apple Ethernet implementations noted. Specifically, any network access and configuration services which depend upon statically configured MAC addresses will require reconfiguration by the network administrator. Such services can include BootP, DHCP, RARP, certain firewall and security scenarios, some routing Access Control Lists, and smart Ethernet hubs incorporating MAC-level security.

The 00:A0:40 address range is now reserved for future Apple expansion, when the 08:00:07 and 00:05:02 ranges are exhausted.

This situation does not affect Power Macintosh 7200, 7500, 8500, and 9500 computers or other Apple Ethernet implementations with physical Ethernet addresses in the original 08:00:07 range.

At Ease: CPU Energy Saver Cannot Shut Down From Panels (10/95)

Revised: 10/12/95
Security: Everyone

At Ease: CPU Energy Saver Cannot Shut Down From Panels (10/95)

=====

Article Created: 12 October 1995

TOPIC -----

I set the CPU Energy saver on all the machines in my computer lab to shutdown if the machine has been idle for more than one hour. All the machines are running At Ease. The CPU Energy saver on all the machines starts counting down at the appropriate time but the machines do not shutdown.

DISCUSSION -----

The CPU Energy Saver can not shut the computer down when it is at the At Ease login screen or At Ease panels. It does the countdown and then the machine remains powered on. If you are in the Finder or Restricted Finder of At Ease, the computer will shutdown.

The Auto Power on/off control panel is able to shut down your computer even when you are in the At Ease panels.

Use the search string 'energy saver and ktable' to locate the TIL article "Energy Saving Control Panels: Description and Compatibility" to determine which energy saving control panels are right for your computer.

System 7.5.2: Clean Install for PowerBook 5300, 2300, 190 7/96

Revised: 7/2/96
Security: Everyone

System 7.5.2: Clean Install for PowerBook 5300, 2300, 190 7/96

Article Created: 12 October 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This article presents the steps necessary to perform a clean installation of System 7.5.2 on a PowerBook 5300, 2300, or 190 series computer.

DISCUSSION -----

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Follow these instructions in the order presented.

Restart with Disk Tools

Shut down your computer, insert Disk Tools in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk icon should be in the upper-right corner of your screen with your hard disk icon below it.

If the computer ejects the Disk Tools disk, make sure you have the Disk Tools specified for your model Macintosh.

Run Disk First Aid

=====

Disk First Aid can detect and repair problems with a hard disk. The Disk First Aid program can be found in the Utilities folder on the hard drive of the PowerBook.

Step 1

Open the Disk Tools disk, and double-click on the Disk First Aid icon. In the window that appears, select the main hard drive.

Step 2

Click once on Repair. Disk First Aid will check your hard disk for any potential problems and repair them if necessary.

Step 3

Repeat this procedure for each hard disk attached to the system.

Step 4

When you are finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid cannot repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For the internal PowerBook hard drive, use Drive Setup, also located on the Disk Tools disk.

Update Hard Disk Drivers

=====

If you do not have an Apple hard drive, or you use third-party software to format your hard disk, do not use the Drive Setup utility. However, you should contact your hard drive vendor to verify that your formatting software is compatible with System 7.5.2.

Following these steps to update the hard disk drivers on the internal PowerBook hard drive:

Step 1

Double-click the Drive Setup icon on the Disk Tools disk to open it.

Step 2

Select the hard drive name under List of Drives.

Step 3

Select Update Driver from the Functions menu.

Step 4

When you're finished, select Quit from the File menu to return to the desktop.

Sometimes Drive Setup can not update the hard disk driver (indicated if the Update Driver selection is dimmed). Here are some possible causes and solutions:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard drive.
- If the driver is corrupted, the Macintosh does not recognize the drive (that is, the drive doesn't show on the desktop when you start from a floppy disk). You may wish to reinitialize it with Drive Setup. This erases the disk, so be certain you back up the hard disk first.
- If the driver was modified with disk compression or security software you may not be able to update the hard drive with Drive Setup. Contact the vendor of the software for any special instructions.

Check Available Hard Disk Space

=====

Be sure you have at least 30 MB available on the hard disk where you plan to install the system software. Open the hard disk's window. Select By Name from the View menu. The amount of available disk space appears in the upper-right corner of any open window.

If there is less than 30 MB available, you need to delete some unnecessary files by moving them to the Trash. Choose Empty Trash from the Special menu, and you will have more disk space available. You can also copy files onto floppy disks or other media before moving them to the Trash.

Performing a Clean Install

=====

You should have made a set of system disks from the disk images on the hard drive when you first got the PowerBook using the Floppy Disk Maker program. The instructions for doing this appear on the screen every time the computer is turned on until the disks are made.

If you still have the disk images on your hard drive (you have not erased them), you will not need the floppy disks to do the clean install. To check if these images are still present, follow the folder path: (through your hard drive):

Utilities -> Floppy Disk Maker -> Disk Images -> System Software Images.

Open each of these folders on your hard drive. The System Software Images folder should contain at least 10 items, including the System Software Installer.

Method 1: If the System Software Images Are On the Hard Drive

=====

Step 1

Start up the computer while holding down the Shift key until you see the message "Welcome to Macintosh, Extensions Off." If your computer will not start up from the hard drive, you can start it up from the Disk Tools disk that came with the computer.

Step 2

Double-click the System Software Installer located in the System Software Images folder. Click OK at the Welcome to System 7.5.2 dialog box.

Step 3

Check that the Destination Disk (located in the lower left hand corner) is set to the startup drive for your computer.

Step 4

Press the Command-Shift-K keys simultaneously.

You are presented with a small dialog box with two selections:

- Update Existing System Folder
- Install New System Folder

Step 5

For a clean install, select Install New System Folder, then click OK.

Step 6

Click the Clean Install button.

The Installer will begin to install the new System Folder. The current System Folder will be renamed Previous System Folder. The installation process will take about 11 minutes and should not be interrupted. When the installation is complete, restart the computer.

Method 2: If the System Software Images Have Been Erased

=====

Step 1

Make sure you have the set of system software disks that you made with the Floppy Disk Maker program. There should be at least 10 disks.

Step 2

Shut down the computer.

Step 3

Insert the disk labeled Install Disk 1.

Step 4

Start up the computer. Click OK when you see the Welcome to System 7.5.2 dialog.

Step 5

Check that the Destination Disk (located in the lower left hand corner) is set to the startup drive for your computer.

Step 6

Press the Command-Shift-K keys simultaneously.

You are presented with a small dialog box with two selections:

- Update existing system folder
- Install new system folder

Step 7

For a clean install, select Install New System Folder, then click OK.

Step 8

Click the Clean Install button.

The Installer will begin to install the new System Folder, asking you to insert each system disk as needed. The current System Folder will be renamed to Previous System Folder. The installation process will take about 25 minutes and should not be interrupted. When the installation is complete, restart the computer.

Move Bundled Items Over

=====

After the computer has restarted, move the following items from the Previous System Folder to the same location in the System Folder:

ATM Font Database

Claris folder

DataViz folder

Launcher Items folder

MacLinkPlus Setup (in the Control Panels folder)

MacLinkPlus for Easy Open (in the Extensions folder)

Verify Problem Resolution

=====

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

=====

You can now reinstall the non-standard items from the old System Folder (now named "Previous System Folder") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks are not available, you may move the non-standard items from the Previous System Folder to the new System Folder. Be careful to only move items that are not already in the new System Folder.

Step 1

Open each corresponding folder within the System Folder and the Previous System Folder then compare the contents.

Step 2

Move anything that is not already in the new System Folder and its subfolders from the Previous System Folder and its subfolders.

Step 3

Restart your Macintosh.

Troubleshooting Extension Conflicts

=====

If you have installed any system extensions or control panels, you will see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

Verify INIT Conflict

=====

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible or conflicting INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

Step 1

Be sure the Caps Lock key is off.

Step 2

Restart, and after you see the picture of a computer with a smile, hold down the Space Bar key.

Step 3

Release the Space Bar key when the "Extensions Manager" window appears.

Step 4

Select "All Off" in the Sets pull down menu then close Extensions Manager.

Step 5

When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with the steps in the next section.

Turn On and Turn Off INITs in System Folder

=====

Step 1

Using the Extensions Manager turn on your Extensions and Controls Panels a few at a time.

Step 2

Close the Extensions Manager, and restart the Macintosh.

Step 3

Attempt to recreate the original problem.

Repeat steps 1 through 3 for each item in the Extensions Manager until the problem reoccurs. One of the last items activated in the Extensions Manager is probably the cause of the problem.

Final Steps

=====

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, move the Previous System Folder to the Trash, and choose Empty Trash from the Special menu.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). Color LaserWriter 12/600 PS: Images Have Blue Tint (12/95)

Revised: 12/18/95
Security: Everyone

Color LaserWriter 12/600 PS: Images Have Blue Tint (12/95)

=====

Article Created: 13 October 1995
Article Reviewed/Updated: 18 December 1995

TOPIC -----

Why do all of my PhotoShop files that are converted to CMYK print with a bluish caste from the Color LaserWriter 12/600 PS printer? I have tried multiple versions of PhotoShop, but all have the same result.

DISCUSSION -----

There could be a couple of reasons why you see a bluish caste.

- Photoshop uses it's own color space conversion when you convert images from RGB to CMYK. A better solution is to keep the image in RGB space, which allows ColorSync to use the input and output device profiles for conversion when printing an image.

- Components of the file are based on a different monitor profile. In other words, some of the images in the file may have been imported from another file that had a different input profile. If this is the case, the colors are not being mapped properly. The images should be imported using the current environment profiles, and then printed using ColorSync Color Matching.

PowerShare 1.1: Technical Specifications (10/95)

Revised: 10/13/95
Security: Everyone

PowerShare 1.1: Technical Specifications (10/95)

Article Created: 13 October 1995

TOPIC -----

This article provides the technical specifications for PowerShare 1.1 .

DISCUSSION -----

Technical Specifications

New features in PowerShare 1.1

- Improved server routing performance that gets messages to their destinations up to three times faster
- Ability to import tab-delimited text files containing data such as Internet addresses and telephone listings
- Ability to store Internet addresses in a PowerShare catalog and manage them from within the PowerShare Admin application
- Apple Migration Tool for Microsoft Mail, for transferring e-mail and user account information from a Microsoft Mail for AppleTalk Networks server to a PowerShare server

PowerShare Mail server

- Provides server-based messaging services for PowerTalk users
- Stores PowerTalk messages to ensure delivery when user systems come on-line
- Saves disk space on client workstations

PowerShare Catalog server

- Stores collaborative information—such as group addresses, document templates, graphics, and sounds—in shared catalogs
- Authenticates users and encrypts their network traffic (including e-mail)
- Supports distributed systems of multiple servers
- Replicates and synchronizes catalogs across multiple servers for higher performance and greater reliability
- Enables multiple collaborative applications to share a single catalog

PowerShare Admin utility

- Lets administrators create user accounts and define groups
- Monitors mail and catalog servers to detect problems
- Provides system alerts to administrators
- Permits server management from any Macintosh system on the network

Easy Setup utility

- Lets administrators quickly configure a simple PowerShare system

System requirements

- One of the following systems:
 - An Apple Macintosh computer with a 68020 or later processor
 - A Power Macintosh computer
 - Any other similarly equipped Mac OS-based computer
- At least 8MB of RAM
- Macintosh System 7.5 or later with PowerTalk* installed
- A hard disk drive
- An AppleTalk connection
- Client computers: Macintosh, PowerBook, Power Macintosh, and/or other Mac OS-based client computers running Macintosh System 7.5 or later with PowerTalk* installed and an AppleTalk connection (direct or via Apple Remote Access software)

* The PowerTalk software included in Macintosh System 7.5 provides a single universal mailbox for all incoming messages from many sources, supports the use of collaborative applications to work together over a network, and lets users set up catalogs (directories) of personal information.

Ordering Information

PowerShare Collaboration Servers

Order No. M1907Z/D

- PowerShare version 1.1 server software, including PowerShare Mail server, Catalog server, Admin, and Easy Setup software
- Apple Migration Tool for Microsoft Mail, for transferring information from a Microsoft Mail for AppleTalk Networks server to a PowerShare server
- PowerShare System Administrator's Guide
- PowerTalk and PowerShare Solutions Guide

Security: Everyone

AppleShare 4.2.1: Questions and Answers (5/96)

Article Created: 13 October 1995
Article Reviewed/Updated: 30 May 1996

TOPIC -----

This article provides a series of questions and answers about AppleShare 4.2.1.

DISCUSSION -----

Question: What is AppleShare?

Answer: AppleShare is high-performance, easy-to-use file and print sharing software that allows networked Macintosh and Microsoft Windows software-based computers to share files, applications, and printers.

Question: What is AppleShare 4.2.1?

Answer: AppleShare 4.2.1 is PowerPC native which supports NuBus-based Workgroup Servers or Power Macintosh computers with classic AppleTalk, and PCI-based Workgroup Servers or Power Macintosh computers with Open Transport 1.1. It provides an average performance improvement over AppleShare 4.1 of 111% for file transfers between clients and the server. However, much larger performance gains (as high as 352%) are experienced in multi-user database applications. These are applications where the database application runs on the client workstations and the shared database file resides on the AppleShare server.

AppleShare 4.2.1 supports up to four network segments simultaneously through Open Transport 1.1's multi-homing capabilities on PCI servers. AppleShare 4.2.1 also supports nearly ten times as many open files as AppleShare 4.1 (3000 instances of 346 unique files in 4.2 vs. 346 in 4.1) and increases the maximum number of concurrent users from 150 to 250.

It also includes a simple-to-manage block cache architecture that dynamically tunes itself for optimal performance. To set up the new cache, the administrator simply allocates a block of memory for the Mac OS and any server utilities (like

..TIL18744-AppleShare_4-2-1-Questions_and_Answers_5-96_(TA34552).pdf

Retrospect for nightly backups), and AppleShare 4.2.1 runs and caches data in the remaining memory. AppleGuide support in 4.2.1 also assists unfamiliar users, making it easier to:

- Set up Users & Groups
- Share volumes
- Set access privileges
- Configure printing

Question: How does AppleShare 4.2.1 differ from AppleShare 4.2?

Answer: AppleShare 4.2.1 adds support for multi-homing with Open Transport 1.1 on PCI-based servers. The AppleShare file server bundle comes with a version of the Apple Remote Access (ARA) Multiport server which allows dial in connections.

Out of the box, you can enable two dial in connections on the server's printer and modem ports. AppleShare 4.2.1 includes COPS Inc's COPS Talk for Windows 95 users. As of 8 May 1996, COPS Talk is not shipping in the AppleShare package. An insert in the box provides an (800) number to call to order the software. AppleShare 4.2.1 also addresses problems with access privileges and modification dates in the previous version.

Question: What do customers gain by running AppleShare native on PowerPC?

Answer: AppleShare 4.2.1 is PowerPC native and completely optimized to take advantage of PowerPC performance and scalability, so users get the familiar ease-of-use of previous versions and dramatically improved performance.

Question: How is AppleShare 4.2.1 being distributed?

Answer: AppleShare 4.2.1 is distributed with PowerPC Workgroup Servers and as an upgrade for the installed base of AppleShare 4.x users.

Question: Is AppleShare 4.2.1 compatible with Open Transport?

Answer: AppleShare 4.2.1 is compatible with Open Transport 1.1, which includes many AppleShare server-specific features like support for multiple concurrent sessions and 100 MB Ethernet performance tuning. Apple has not certified AppleShare 4.2.1 and Open Transport on NuBus-based Power Macintosh computers and Workgroup Servers. Customers running AppleShare 4.2.1 on these systems should continue to use the "Classic" AppleTalk stack.

Question: What are the hardware requirements for AppleShare 4.2.1.

Answer: AppleShare 4.2.1 is designed and tested with PowerPC-based Workgroup Servers (WS) in mind, including both NuBus and PCI products. Therefore, AppleShare 4.2.1 is intended for the following Workgroup Servers:

WS 6150 and WS6150/66 running at least Mac O/S 7.5.1

WS 8150 and WS8150/110	running at least Mac O/S 7.5.1
WS 9150 and WS9150/120	running at least Mac O/S 7.5.1
WS 7250/120	running at least Mac O/S 7.5.3
WS 8550/132	running at least Mac O/S 7.5.3

Customers who purchased AppleShare 4.x when it was available as a stand alone product may upgrade to AppleShare 4.2.1 and run AppleShare on the following systems and receive support from Apple:

Power Macintosh 6100/60	running at least Mac O/S 7.5.1
Power Macintosh 6100/66	running at least Mac O/S 7.5.1
Power Macintosh 7100/66	running at least Mac O/S 7.5.1
Power Macintosh 7100/80	running at least Mac O/S 7.5.1
Power Macintosh 8100/80	running at least Mac O/S 7.5.1
Power Macintosh 8100/100	running at least Mac O/S 7.5.1
Power Macintosh 8100/110	running at least Mac O/S 7.5.1
Power Macintosh 7200/75	running at least Mac O/S 7.5.3
Power Macintosh 7200/90	running at least Mac O/S 7.5.3
Power Macintosh 7200/120	running at least Mac O/S 7.5.3
Power Macintosh 7500/100	running at least Mac O/S 7.5.3
Power Macintosh 8500/120	running at least Mac O/S 7.5.3
Power Macintosh 8500/132	running at least Mac O/S 7.5.3
Power Macintosh 9500/120	running at least Mac O/S 7.5.3
Power Macintosh 9500/132	running at least Mac O/S 7.5.3

Question: Does AppleShare 4.2.1 require the AppleShare client software to be upgraded in order to experience the improved performance?

Answer: It is not necessary for customers to upgrade their AppleShare client to get the performance benefits of 4.2.1 on a server. The dramatic performance increases are due to additional server features like dynamic caching and PowerPC native code.

However, on a client workstation, if a customer is using AppleShare Workstation software prior to v3.6.1, Apple recommends that customers install the latest version of the AppleShare client software. AppleShare Workstation 3.6.2, when running with Mac OS System 7.5.1 or later, will significantly improve the performance of any AFP server on the client. Macintosh clients will notice greatly improved performance when copying large files in the Finder. AppleShare Workstation 3.6.2 in conjunction with System 7.5.3 allows users to set and change passwords with the Alias Manager.

Question: Can customers with AppleShare Pro, which runs on the Apple Workgroup Server (AWS) 95 with A/UX upgrade to AppleShare 4.2.1?

Answer: Yes. There is an upgrade path for AppleShare Pro customers. However, since it involves moving to a new hardware platform based on PowerPC technology, extra steps are required. Customers wishing to do this need to do three things.

1) Since AppleShare Pro did not use serial numbers, customers upgrading to AppleShare 4.2.1 need to get a unique serial number for each server being

upgraded. Do this by calling 800-767-2775 ext 916. Proof of ownership will be required.

2) Purchase the AppleShare 4.2.1 upgrade kit(M4568Z/B) by calling 800-293-6617 ext 759 for \$199. Proof of ownership will be required.

3) UNIX based applications that were running on the AWS 95 will no longer run on a Mac OS based server. Also, Apple recommends upgrading Macintosh applications to the native versions whenever possible. Customers moving from A/UX to Mac OS will want to plan this migration carefully.

PowerShare 1.1: What Is New (10/95)

Revised: 10/13/95
Security: Everyone

PowerShare 1.1: What Is New (10/95)

=====

Article Created: 13 October 1995

TOPIC -----

What's new in PowerShare 1.1?

DISCUSSION -----

PowerShare 1.1 includes better support for Internet-style addresses, including the ability to import Internet addresses from a text file into the PowerShare catalog. PowerShare 1.1 allows administrators to import more types of data directly into the PowerShare catalog, improved performance in message routing and more information in the log windows. All of these features make PowerShare 1.1 easier to support and easier to integrate into an SMTP-based environment.

The PowerShare 1.1 box also includes the Apple Migration Tool for Microsoft Mail which will transfer user-account information from a Microsoft Mail for AppleTalk Networks server to a PowerShare system. Apple has also bundled a demonstration version of the StarNine Internet gateway for PowerShare.

PowerShare 1.1 & 1.0 Servers Compatibility (10/95)

=====

Article Created: 13 October 1995

TOPIC -----

Are PowerShare 1.1 servers and PowerShare 1.0 servers compatible?

DISCUSSION -----

PowerShare 1.0 and 1.1 servers work together seamlessly. It is possible to combine both revisions of the server software in the same PowerShare system. This makes upgrading significantly easier since not all servers need to be upgraded simultaneously.

AppleShare Client for Windows: Difference 1.0 to 1.0.2 (11/95)

=====

Article Created: 13 October 1995
Article Reviewed/Updated: 27 November 1995

TOPIC -----

How is AppleShare Client for Windows 1.0.2 version different from 1.0?

DISCUSSION -----

The AppleShare Client for Windows 1.0.2 differs from the 1.0 product in several ways. Version 1.0.2 supports LocalTalk and Token Ring networks, in addition to Ethernet networks that were supported in version 1.0. Version 1.0.2 also supports PCs with a PCI bus and includes an updated installer that is much easier. Additionally, version 1.0.2 supports double-byte languages, enabling it to be localized in Japanese, Korean and Chinese. Version 1.0.2 also allows rapid multiple print jobs and large (10 MB+) print jobs to print reliably and addresses a problem with Cisco router compatibility.

AppleShare Client for Windows 1.0.2 and Windows 95 (5/96)

=====

Article Created: 13 October 1995
Article Reviewed/Updated: 31 May 1996

TOPIC -----

Is the AppleShare Client for Windows 1.0.2 compatible with Windows 95?

DISCUSSION -----

AppleShare Client for Windows is not compatible with Windows 95. There are third party vendor products that provide connectivity to LocalTalk, Ethernet or TokenRing networks. Personal MacLAN Connect by Miramar Systems, runs on Windows 3.1x and Windows 95. COPSTalk for Windows, by COPS, Inc., runs on Windows 3.x and Windows 95.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Personal LW SC: Use Regular Tray W/ Desktop Printing (10/95)

=====

Article Created: 16 October 1995
Article Reviewed/Updated: 19 October 1995

TOPIC -----

When printing using the manual feed option on the Personal LaserWriter SC with desktop printing enabled, the computer bombs with a bus error. This does not happen with desktop printing disabled. How can I correct this?

DISCUSSION -----

There is a conflict between the Desktop PrintMonitor and the Personal LaserWriter SC driver. When printing using the manual feed, the bus error occurs. This conflict occurs with both Desktop PrintMonitor versions 1.0.1 and 1.0.3.

The problem is related to the method that the drivers use to communicate with the printers during certain functions. The solution has been identified by engineering and is scheduled to be fixed in the next revision of the Desktop Printing software.

The present workaround is to use the regular paper tray, and not manual feed.

Power Macintosh 5200: Monitor Adjustment Cable Pinouts (10/95)

=====

Article Created: 16 October 1995

TOPIC -----

I need the pinout of the Power Macintosh 5200 Monitor Adjustment cable, part number 922-1513, to view the on-screen video adjustment controls.

DISCUSSION -----

In order to view the on-screen video adjustment controls, which appears after the display test patterns, it is imperative to properly install the monitor adjustment cable as instructed in the Service Source CD. Be sure to connect pin 1 of the Monitor Adjustment Cable 2-pin connector to pin 1 of P805 (square marking on the analog board). The monitor adjustment cable service part number is 922-1513.

If the monitor adjustment cable is not properly connected, then you may never see MacTest Pro's on-screen video adjustment controls as shown in the Service Source CD.

For your information, the following are the monitor adjustment cable pin assignments (as seen from the cable connector):

Monitor Adjustment Cable serial end:

Differences Between AppleTalk v58.1.5 and v58.1.6 (1/96)

Revised: 1/12/96
Security: Everyone

Differences Between AppleTalk v58.1.5 and v58.1.6 (1/96)

=====

Article Created: 17 October 1995
Article Reviewed/Updated: 12 January 1996

TOPIC -----

What are the changes made from AppleTalk v58.1.5, distributed on the Network Software Installer (NSI) 1.5.1, to AppleTalk v58.1.6, shipped on the PowerBook 5300 series computers?

DISCUSSION -----

The change to AppleTalk v58.1.6 was needed to implement built-in infrared technology (IRTalk). If the version number for AppleTalk had not been revised with the PowerBook 5300 Series computers, then running NSI 1.5.1 would over write the IRTalk changes. So by changing AppleTalk to v58.1.6, even if a user does run NSI 1.5.1, the AppleTalk resources will not be written over because the version pre-installed on the PowerBook is newer than the one on the NSI 1.5.1 disk.

UUencode & UUdecode: Explained (11/95)

Revised: 11/14/95
Security: Everyone

UUencode & UUdecode: Explained (11/95)

=====

Article Created: 17 October 1995
Article Reviewed/Updated: 14 November 1995

TOPIC -----

This article describes UUencoding and UUdecoding, a popular method to transfer binary information on the Internet.

DISCUSSION -----

What is UUencode?

=====

UUencode stands for Unix-to-Unix Encode. It is a text-based binary encryption protocol in wide use on the Internet to transfer files across multiple platforms including UNIX, Windows, MS-DOS, Macintosh, and other operating systems. UUencode is the UNIX name for the encryption program; it is normally used with another UNIX program, UUdecode, which decodes an encrypted message.

Why UUencode files?

=====

The basic idea behind UUencoding a file is to translate a binary representation of data -- which could be a graphic image, compressed file, or other type of binary data -- into an encrypted text representation of that file.

There are two reasons for doing this:

1) Many mail systems used on the Internet cannot handle binary transmissions since they are designed for text data. However, if a file is UUencoded, it can be included as text in the message.

2) Many mail systems and gateways have size limitations, often less than 50 kilobytes (K). It is sometimes necessary to use a text editor to split or

combine such files. Since a binary representation of that data would make the editing of data very difficult, and since software that automatically joins these binary files is relatively rare, UUencoding a binary file allows common text editors to be used to join such files.

How can you tell it's a UUencoded file?

=====

There is no standard file name convention, although most UNIX-based systems use a .uu as a suffix. DOS-based computers, with their standard three-digit suffixes, generally use .uue. This is one general method of telling whether or not it is a UUencoded file. Another method is actually looking at the first line of the file.

A UUencoded file can be identified by the first line of the file:

```
-> begin 644 myfile.gif
```

This line is followed immediately by the start of the data. The first character of every line is the letter M. If the file has other characters other than M, the file is either not a UUencoded file, or has been damaged:

```
-> MuVAA=baI<RabzvYHyw@_cpUbzvYHyw@@zwl@xF]TzbaAhgmE=baOyBaA<gaL
```

The block ends with a single line containing the statement:

```
-> end
```

The first line signals the start of the block. The number 644 is a UNIX permissions flag (in this case, giving the owner of the file full read and write permissions) while giving other users read permissions only). The third part is the file name that uudecode will expand the file as.

What are the versions of UUencode?

=====

UUencode is a standard, but a number of implementations of the software exist. Most implementations are based upon source code from versions of the UNIX software which are in the public domain.

Macintosh and most Windows versions tend to combine both the UUencode and UUdecode functions into a single program, and simply allow you to choose if you want to encode or decode a message.

What issues should I be aware of?

=====

UUencoded data should be line-terminated with a single carriage return. Some mail systems append multiple line feeds or carriage returns, which can confuse some implementations of UUdecode.

UUencode is intended for use with a straight binary file. Since Macintosh files contain both a data fork and a resource fork, you should use Binhex to send Macintosh binary files. There are some types of files that you can UUencode, but you should limit these to files you know are going to other people using different operating systems.

Types of Files You Can UUencode

- Graphics (includes GIF, JPEG, and TIFF files)*
- Word processing files
- Miscellaneous non-Macintosh specific files

* PICT files are Macintosh based, so you should use Binhex to transmit these types of graphics.

Type of Files You Should Not UUencode

- Applications
- Control panels
- Extensions
- Fonts
- Macintosh-specific compressed files (SuffIt, Compacter)

You should use Binhex to transmit these types of files.

UUencode and UUdecode Tips

=====

- Do not imbed "white space" in the file. The first line of the file should start with the begin line and the last line of the file should be the end statement.

If you UUencode a file, the only to determine if your file starts with begin and finishes with end is to open it in a text editor or word processing application and check it.

- If a message was received as multiple email messages, intervening message headers and "white space" should be removed. Some UUdecode utilities cannot handle the additional returns and headers.
- Since there are a large number of UUencoding and UUdecoding applications on various computer platforms, you may get some errors during the decoding process.

If you encounter errors decoding a file and are sure the source (input) file is correct, try a different UUdecoding utility. If the errors persist, have the sender of the data encrypt the data using a different version of UUencode.

DOS Compatibility Card and System Memory Allocation (10/95)

Revised: 10/17/95
Security: Everyone

DOS Compatibility Card and System Memory Allocation (10/95)

=====

Article Created: 17 October 1995

TOPIC -----

In the About This Macintosh box, something is causing the System Software line to report a large allocation of memory. The DOS Compatibility Card software is not even installed and I have started the computer with extensions off. What is wrong?

DISCUSSION -----

The About This Macintosh box reports memory being shared with the DOS Compatibility Card on the System Software line along with the space taken up by normal system software. If the PC Setup control panel is not loaded, without first being turned off, the memory allocated to the DOS card will not be de-allocated and will still be reported as being used. Here are two workarounds that may clear this issue:

- Reload the PC Setup control panel and use the on/off option at the top of the control panel to turn off the DOS Compatibility Card. The System Software line will report the proper memory value after the computer is restarted.
- The Parameter RAM can be reset by holding down the Command-Option-P-R keys simultaneously at startup. This will also release the memory so the System Software line will report the proper memory value on startup.

Color LaserWriter 12/600 PS: Maximum Imageable Area (10/95)

Revised: 10/17/95
Security: Everyone

Color LaserWriter 12/600 PS: Maximum Imageable Area (10/95)

=====

Article Created: 17 October 1995

TOPIC -----

This article provides information about the maximum printable area for the Color LaserWriter 12/600 PS printer.

DISCUSSION -----

The imageable area on a page does not change with additional RAM in the Color LaserWriter 12/600 PS printer. The imageable area is defined in the PPD file for a specific printer. You can view the image values by opening the PPD file in a text editor or word processing application. Search through the text until you see the imageable areas defined. The formula to determine the imageable area is a little complicated, but here are the results.

Note:

The results are posted in fractions of an inch and are rounded to the nearest 100th of an inch.

DOS Compatibility Card: Cannot Find PC Network Extension (10/95)

Revised: 10/17/95
Security: Everyone

DOS Compatibility Card: Cannot Find PC Network Extension (10/95)

Article Created: 17 October 1995

TOPIC -----

I get an error message when I try to run MS-DOS from my Power Macintosh DOS Compatibility Card. The error message occurs after MS-DOS gives up looking for the PC Network Extension, the error message reads "Cannot communicate with PC Network Extension". Why am I getting this message.

DISCUSSION -----

The PC Network Extension is a required extension for any MS-DOS networking product to work properly. These messages occur if the PC Network Extension is not loaded. There are two common reasons why PC Network Extension will not load:

1) AppleTalk is inactive in Chooser.

Make sure that AppleTalk is active in Chooser. Turning AppleTalk inactive disables the networking capabilities of your computer. When AppleTalk is inactive, the PC Network Extension cannot load because it is not able to access the Ethernet port.

2) PC Network Extension is not installed.

Make sure that the PC Network Extension is located in your Extensions folder. The PC Network Extension must be in the Extensions folder at startup for it to load. If you cannot find PC Network Extension, it can be replaced by reinstalling the DOS Compatibility Card Installer Disk for Macintosh Environment.

QuickTime Conferencing: H.261 Compression Read Me File (10/95)

Revised: 10/17/95
Security: Everyone

QuickTime Conferencing: H.261 Compression Read Me File (10/95)

=====

Article Created: 17 October 1995

TOPIC -----

This article contains the ReadMe file about H.261 compression included with the QuickTime Conferencing software.

DISCUSSION -----

About H.261 Compression

The H.261 QuickTime Component is a software-only realization of the H.261 video-conferencing compression standard. It allows bit rates of 64 Kbits/sec to 384 Kbits/sec of 352x288 pixels or smaller frames. It can be used to compress QuickTime movie files, as well as video input from cameras.

System requirements and installation

This version of H.261 QuickTime Component works only on Power Macintosh computers. (You cannot send video to a 68000-based Macintosh using this method of compression.) The frame rate is dependent on the processing speed of your computer.

The H.261 coder decoder (codec) is installed in the Extensions folder (within the System Folder) by the QuickTime Conferencing Installer.

You should allow 1 MB of extra random-access memory (RAM) for the codec in addition to the 3 MB recommended for the Apple Media Conference application program. (You might try quitting other application programs or reducing the memory of the programs you are running.)

Setting options

You set compression options in the Video Settings dialog box. From the Apple Media Conference application program, choose Video Settings from the Settings menu. Select Compression in the Video Settings dialog box, then select H.261

from the Compressor pop-up menu.

Setting Video Bandwidth:

To set video bandwidth, you use the Quality slider in the Video Settings dialog box. The bandwidth changes linearly from 64 Kbits/sec. with the Quality slider set at Least, to 384 Kbits/sec. with the Quality slider set at Most.

When you are communicating over low-bandwidth networks (for example, Internet or ISDN), you should set the Quality slider to Least or Low.

Setting Key Frames:

Key frames improve video integrity when communicating over unreliable or low-bandwidth networks (at the expense of reducing image quality). The Key Frame option is accessed by opening the Video Settings dialog box. When the Key Frame option is unchecked, key frames are sent continuously. You can reduce the frequency of key frames by clicking on the Key Frame checkbox and entering a new key frame frequency. We recommend that you start with key frames every 25 or more frames.

Tips and troubleshooting

Window Sizes:

The current codec supports window sizes up to 352x288 pixels. The codec operates fastest when the window size is less than 176x144 pixels (note: Normal Size is 160x120). For medium and large window sizes, set the Quality slider at Medium, High, or Most.

Dropped Frames and Ghosting Artifacts:

If frames are dropped by the network, "ghosting" artifacts (that is, pieces or moving edges left over from previous frames) will persist in the image until the next key frame. This problem should not persist for more than a few frames (that is, less than a second) with QuickTime Conferencing.

"Ghosting" artifacts occur when receiving computer is too busy to decode the frames, or if the bandwidth of the connection between computers is too small. Here are some ways to alleviate ghosting problems:

On the sending computer:

- Set the Quality slider to a lower setting.
- Make the Self View window smaller.
- Use a key frame every 15 frames.
- Select Thousands from the Depth pop-up menu in the Video Settings dialog box.

On the receiving computer:

- Set your monitor to use Thousands or Millions of colors.
- Click the caller's window to make it active, and choose Normal Size from the Window menu.

Share DOS Volume Between Power Macintosh DOS Computers (10/95)

Revised: 10/18/95
Security: Everyone

Share DOS Volume Between Power Macintosh DOS Computers (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

Can a Macintosh folder on a Power Macintosh 6100 DOS Compatible computer be used as a shared DOS volume and be seen as a shared DOS Drive on another Power Macintosh 6100 DOS Compatible computer?

DISCUSSION -----

Yes, you can do what you describe by following the steps below to mount a shared DOS volume.

Step 1

Create a folder on the desktop of the source Power Macintosh 6100 DOS Compatible computer, and map the folder to a drive letter using the Sharing option in the PC Setup control panel.

Step 2

Use Macintosh personal file sharing to share the folder, created in Step 1, on the network. Also be sure your Users & Groups control panel has either the shared user, or everyone setup so the destination Macintosh can access the folder.

Step 3

Mount the shared folder on the destination Power Macintosh 6100 DOS Compatible.

Step 4

Map this shared folder, from Step 3, to a drive letter with the Sharing option of PC Setup control panel.

Step 5

The same folder is now seen as a mounted drive in the respective DOS environments.

Please Note: The computers used to test this setup both had SIMMS installed on the DOS Compatibility Card. This lets the PC environment operate without sharing memory with the Macintosh environment.

AppleVision 1710AV: Icons Rearranging On Restart (10/95)

Revised: 10/18/95
Security: Everyone

AppleVision 1710AV: Icons Rearranging On Restart (10/95)

=====

Article Created: 17 October 1995

TOPIC -----

I have a Power Macintosh 7100/66AV, running System 7.5.1, and an AppleVision 1710AV display. On startup or restart the desktop will automatically rearrange all of the icons on the desktop in alphabetical order on the right side of the screen, as if I had chosen the "Clean up all" command from the Special menu.

I have found that leaving a Finder window open in icon view before restarting or shutting down, will alphabetically rearrange the icons in that window, instead of on the desktop. Is there a way to correct this problem?

DISCUSSION -----

Apple is aware of this issue and some workarounds have been developed to address it. Try one of the following workarounds to prevent the icons from rearranging on your desktop:

Workarounds
=====

System 7.5

- Create a new empty folder in the Shutdown Items folder (in the System Folder). When the computer is shutdown, the folder will open. At startup the Finder will try to rearrange the contents of the empty folder, not the icons on the desktop.*

System 7.5 or Earlier System Software

- Leave a Finder window open before restarting or shutting down. The icons in that window will be rearranged, instead of the ones on the desktop.*

- Use a sense code adapter. Doing this would force the Macintosh computer to recognize the AppleVision 1710AV display as a monitor with only one available

resolution. For example, an adapter could be used to make the computer believe that the AppleVision 1710AV display was a 21-inch RGB display.

* Note: If you have any external volumes (hard drive, server, or other) that automatically mounts at startup, you will need to leave an empty open folder on the last mounting volume. If other volumes mount at startup after the empty window opens, the window will move to the background - and will not prevent reorganization.

LaserWriter Printers: Available Line Screens (1/97)

Revised: 1/31/97
Security: Everyone

LaserWriter Printers: Available Line Screens (1/97)

Article Created: 18 October 1995
Article Reviewed/Updated: 31 January 1997

TOPIC -----

This article provides the line screen for all Apple LaserWriter printers, plus some common questions about line screen and printers.

DISCUSSION -----

Line Screen of Apple LaserWriter Printers

Here are the default line screens for Apple LaserWriter printers. These values are taken from the PPD files. Many applications such as Quark Xpress, PageMaker, and Illustrator allow you to change the line screen since these applications create their own PostScript code.

Begin_Table

Model	LPI	Screen Angle
=====	===	=====
LaserWriter	60	45 degrees
LaserWriter Plus	60	45 degrees
LaserWriter IINT	60	45 degrees
LaserWriter IINTX	60	45 degrees
LaserWriter IIIf	60	45 degrees
LaserWriter IIg	106	45 degrees
LaserWriter Pro 600	85	45 degrees
LaserWriter Pro 630	85	45 degrees
LaserWriter Pro 810	60	45 degrees
LaserWriter Select 360	85	45 degrees
LaserWriter 4/600	106	45 degrees
LaserWriter 16/600 PS	106	45 degrees
Color LaserWriter 12/600 PS	200/141	
Color LaserWriter 12/660 PS	200/141	

Personal LaserWriter NT	60	45 degrees
Personal LaserWriter NTR	60	45 degrees
Personal LaserWriter 320	53	45 degrees

End_Table

Common Line Screen Questions

=====

Question: Is line screen dependent on DPI or the printer? - meaning will every 300 DPI printer have the same line screen.

Answer: Not necessarily. There are two different issues here:

- 1) Line screen IS partially dependent on dpi, and enhancements like PhotoGrade.
- 2) The line screen on any printer can be changed with programs that generate their own PostScript.

Two 300 dpi printers can have the same line screen, however, may produce different results if one has PhotoGrade; PhotoGrade technology in effect increases dpi.

Line screens (LPI) are based on the number of horizontal dots in a halftone cell and the printer's DPI. Thus, a halftone cell of 2x2 has 2 dots horizontally which provides a 150 line screen on a 300 DPI printer, or a 300 line screen on a 600 DPI printer. A halftone cell of 1x1 has 1 dot horizontally, so produces a 300 line screen on a 300 DPI printer, or a 600 line screen on a 600 DPI printer.

Note that line screens equal to the printer's DPI are only useful when printing text since the levels of gray equals 2, black and white -- gray value of 2 is calculated by the following:

$((300/300)**2) + 1$, or $((600/600)**2) + 1$.

Note:

The maximum line screen can never exceed the dpi of the printer (for example, 300 LPI maximum for a 300 DPI printer), and programs such as Quark Xpress only allow certain line screen values between 15 and 400.

Question: Is line screen a fixed number on the printer, or can all printers print at different line screens?

Answer: Line screen is changeable on most all Apple printers. In our tests with the LaserWriter IINTX, for example, you are able to change the line screens to values like 15 LPI, 50 LPI, and 61 LPI and observe noticeable changes - greater levels of gray. On older printers like the LaserWriter IINTX, changing the line screen to greater than half of the dpi (for example >150 LPI on 300 DPI printers) resulted in no noticeable change. These printers have a "threshold" value that they do not exceed. For most of the older 300 DPI printers, the threshold line screen is 150 lpi since that provides 5 levels of gray $((300 \text{ DPI}/150 \text{ LPI})**2) + 1$. Any line screen value above 150 for a 300 DPI printer would produce less than 5 levels of gray (which the printer's ROM deems as

useless), so the printer does not go beyond a 150 line screen.

Line Screen Summary =====

The following relationship best summarizes what LPI really means:

- Increased LPI results in increased resolution, but decreased levels of gray.
- Decreased LPI results in decreased resolution, but increased levels of gray.
- Basically, as lpi approaches dpi, resolution is increased but the number of dots in a halftone cell decrease, resulting in less number of grays.

The best way to see all of these effects is by printing a picture of a person's face with some large text in the background, at 50 LPI and 100 LPI on a printer like the LaserWriter Pro 630.

LW Pro 810: EtherTalk and IP Address Issue (10/95)

Revised: 10/18/95
Security: Everyone

LW Pro 810: EtherTalk and IP Address Issue (10/95)

=====

Article Created: 6 April 1994
Article Reviewed/Updated: 18 October 1995

TOPIC -----

We have found that our LaserWriter Pro 810 could not be seen on an EtherTalk network until an IP address was assigned to it. Does an IP address have to be assigned even though we are not using TCP/IP?

One last question is how do you change the netmask for the printer?

DISCUSSION -----

We haven't experienced this problem. In your case, it may just be that the port was disabled, and defining an IP address enabled it. If this problem occurs again, check the status of the port via the printer's control panel; take the printer offline, select the Input Port menu, then select Ethernet and check if it's enabled/disabled. Again, from our experience the following statement on page 2-1 of the "Network Installation and Configuration Manual" is true:

"If you are ABSOLUTELY sure that NO host on the network uses (and never will use) the TCP protocol, an IP address is not needed."

To set the netmask to 255.255.252.0, you can do this via RCF (the printers Remote Console Facility) with the following command:

```
define server subnet mask 255.255.252.0
```

NOTE: You must be in super user mode to execute this command. After getting into RCF with "access" as the default password, you can get into super user mode by typing su <cr>, and then the super user password which is "system".

Changes will take effect after the printer has been restarted.

Color LW 12/600 PS: Windows Installer Runs Constantly (10/95)

Revised: 10/19/95
Security: Everyone

Color LW 12/600 PS: Windows Installer Runs Constantly (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

I installed the Windows software for the Color LaserWriter 12/600 PS. Now every time I restart Windows the computer comes up with a window titled 'Install PostScript Printer from PPD' that asks me to install another printer driver. Why does this happen and how can I make it stop doing this?

DISCUSSION -----

Windows uses a text file in the WINDOWS directory called WIN.INI to hold certain settings about the Windows environment, including a line instructing the computer what software to automatically run on startup. This line starts with the text 'run='. Any program after the equal sign automatically runs when Windows starts up.

The installer for the Color LaserWriter 12/600 PS restarts Windows in the middle of the software installation. It puts the text '_PPDSTRT' at the end of the 'run=' line so the installer continues once Windows is restarted. When _PPDSTRT is run, it brings up the 'Install PostScript Printer from PPD' screen.

Normally, the installer removes '_PPDSTRT' from the 'run=' line when installation is complete. However, if there is anything else on the 'run=' line when the software is installed, the installer will not remove '_PPDSTRT' from this line and the 'Install PostScript Printer from PPD' screen appears every time Windows is restarted.

To correct this, remove the text '_PPDSTRT' from the 'run=' line in your WIN.INI file.

QuickTime Conferencing Camera: Which Cables Do I Use? (2/97)

Revised: 3/3/97
Security: Everyone

QuickTime Conferencing Camera: Which Cables Do I Use? (2/97)

Article Created: 17 October 1995
Article Reviewed/Updated: 3 March 1997

TOPIC -----

I am using a QuickTime Conferencing Camera 100 with my Power Macintosh 8500. I have them connected via the S-Video to RCA and DC Power combination cable that came with the camera. I am getting an image but it only appears in black and white. This happens regardless of color depth or resolution chosen in the Monitors control panel.

Which of the three cables that came with my QuickTime Conferencing Camera am I supposed to use?

DISCUSSION -----

There are three cables shipping with the QuickTime Conferencing Camera 100:

- A) 1 Combination cable, S-Video to DC Power and RCA jack
- B) RCA to RCA
- C) S-Video to DC Power

You must use the appropriate cable for your computer in order for QuickTime Conferencing to work correctly.

The output from the QuickTime Conferencing Camera 100 is an NTSC composite signal, not an S-Video component signal. With the exception of the Power Macintosh 7500 and 8500, AV equipped Power Macintosh computers will accept a composite video signal through the S-Video port. The S-Video port also provides 12-volt power to the QuickTime Conferencing Camera. For Power Macintosh AV computers other than the Power Macintosh 7500 and 8500, use cable A to connect the S-Video connector to the computer's S-Video port and the RCA and DC Power pigtail on the other end of the cable to the QuickTime Conferencing Camera.

The Power Macintosh 7500 and 8500 computers cannot receive a composite video signal in their S-Video connectors. Because of this, you need to connect cable B from the RCA jack on the QuickTime Conferencing camera to the RCA jack on the back of the Power Macintosh 7500 or 8500. If you use the S-Video port to deliver the video to the computer, you will see a black and white image. You also need to use cable C to deliver power from the S-Video port on the Power Macintosh 7500 or 8500 to the QuickTime Conferencing camera.

If you have a Macintosh Quadra or Centris 840AV or 660AV, there is no S-Video port to supply power to the camera. In addition to using cable B for video, you will need to purchase a 12-volt, 1.9 Watt AC adaptor. The specifications for the camera can be found in the camera manual so you can purchase the appropriate power supply. The standard 12 volt or "variable voltage" adaptor from Radio Shack will work.

Begin_Table

Summary Table

=====

Computer	Cable	Video Signal	Camera Power
-----	-----	-----	-----
Quadra/Centris 660AV/840AV	B	From Cable B	Separate Power Adaptor
Power Macintosh 6100AV	A	From Cable A	From Cable A
Power Macintosh 7100AV	A	From Cable A	From Cable A
Power Macintosh 8100AV	A	From Cable A	From Cable A
Power Macintosh 7500/7600	B & C	From Cable B	From Cable C
Power Macintosh 8500/8600	B & C	From Cable B	From Cable C
Power Macintosh 5400/5500**	B & C	From Cable B	From Cable C
Power Macintosh 6400/6500**	B & C	From Cable B	From Cable C

**Requires the Video-In Card, which is an optional card (that is, it does not come with these computers - it has to be added).

PowerTalk: Mail*Link Internet For PowerTalk Read Me File (10/95)

Revised: 10/19/95
Security: Everyone

PowerTalk: Mail*Link Internet For PowerTalk Read Me File (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

This article contains the ReadMe file included with the Mail*Link Internet for PowerTalk gateway software posted online.

DISCUSSION -----

Mail*Link for PowerTalk/INET 1.6

Mail*Link Internet for PowerTalk is a personal gateway for PowerTalk users. This gateway will allow PowerTalk users to send mail via SMTP and receive mail from a POP3 account. Mail can be sent and read with any PowerTalk mail-enabled application.

This release of Mail*Link for PowerTalk/INET is the first release of this gateway by Apple Computer Inc. This gateway is functionally equivalent to version 1.5.1. Future versions of this software will be modified and enhanced.

This software is licensed to you under the Macintosh System 7.5 license agreement. All terms and conditions of this license must be followed.

Upgrade Note: If you are upgrading from version 1.5.1 or earlier it is VERY IMPORTANT that you follow the instructions in the Upgrading Section below.

The installation and upgrade procedure for this software will still install the StarNine demonstration key files (which were part of the 1.5.1 release). However the 1.6 release of the gateway has been modified to ignore the key files and thus will never expire.

It is required that you install and configure MacTCP before using this gateway. See the PT/INET User Guide for more information.

ITEMS OF NOTE
=====

OpenTransport users: This gateway does not function correctly when used with Apple's OpenTransport. The gateway will connect one time but will not reconnect without a reboot. Apple is currently investigating problem.

INSTALLATION INSTRUCTIONS

=====

For new installations only:

We recommend that you install this software via the installer script.

Step 1

Double click on either the "Installer" icon.

Step 2

Select the drive on which you wish to install this software and click Install.

Step 3

Reboot the system after the software has been properly installed.

UPGRADE INSTRUCTIONS

=====

If you are upgrading from a previous release of Mail*Link Internet for PowerTalk, you should follow these instructions:

Step 1

Install the software as instructed in the section "INSTALLATION INSTRUCTIONS".

Step 2

After the system has rebooted, open the "PowerTalk Key Chain".

Step 3

Open the PT/Internet personal gateway in the key chain.

The installation procedures change the file-id that PowerTalk uses to locate the Mail*Link PT/INET file. Opening and closing the PT/Internet Service configuration window will cause the new file-id to be written into the PowerTalk configuration file.

Step 4

Close the key chain. You will be told that you must reboot the system before PowerTalk will activate the gateway.

Step 5

Reboot the system.

If you have trouble with the gateway after upgrading please re-install by following the instructions in the Clean Upgrade Install section below.

CONFIGURATION

=====

Creating your PT/Internet personal gateway

Once you have installed the software and rebooted the system (as described above), follow these instructions to create your PT/Internet personal gateway.

Step 1

Open the "Key Chain" located on your desktop.

Step 2

Press the "Add" button.

Step 3

You will be presented with a list of services that are available. Select "PT/Internet".

Step 4

A new item with the server name of "Not Configured" and a service type of "PT/Internet" will appear in your "Key Chain".

Step 5

Proceed to the "Configuring" section below.

Configuring your PT/Internet personal gateway

To configure the PT/Internet personal gateway, ensure that the "Key Chain" has been opened.

Step 1

Double click (Open) the item with a service type of "PT/Internet". The PT/Internet personal gateway only allows one instantiation, so there should only be one item with this type in the Key Chain window.

Step 2

You should configure each item in this window before closing the window. Window closing is equivalent to pressing the "OK" button in a dialog. The "Key Chain" configuration windows have no "Cancel" operation, so please ensure each item is properly filled in before closing the window (you can always come back and change the selections at a later date, but it is better if each item is properly filled in).

Step 3

To finalize configuration YOU MUST select the preferences button on open the PT/INET Preference dialog. Change any preferences you need to (it is not necessary to change any) and close the window.

Step 4

Once you have entered the information in the configuration window, close the window with a mouse click in the close box or by typing "<command>W". It may take a few seconds for the window to close. This is because PowerTalk is activating all of the personal gateway subsystems and informing them of their new configuration. Be patient.

Step 5

Once the PT/Internet configuration window is closed, close the Key Chain window.

CLEAN UPGRADE INSTALLATION

=====

Use this procedure if you are experiencing problems with the gateway software. You should not need to use this procedure for normal installs. To perform a "Clean Install" of the gateway software, use the following procedure.

NOTE: Some gateways may remove mail from your In Tray and Out Tray when they are reinstalled. Be sure to back up any items in your InTray and OutTray by dragging them to another folder on your hard drive.

NOTE: This will remove all services from your keychain, so be sure you have the passwords for these services handy. If you have personal gateways already installed, you will need to set them up again, so be sure you write down the setup information that is contained in each key, if necessary.

This procedure removes all "Mail*Link" gateways. If you have multiple "Mail*Link" gateways installed, you will need to re-install each of the gateways you want to use.

Step 1

Open the Extensions folder, located inside the System Folder. Find the following item(s) and drag to the trash (note only the gateways you have installed will be in the Extensions folder):

- Mail*Link PT/QM
- Mail*Link PT/MS
- Mail*Link PT/INET

Step 2

Open the Preferences folder, located inside your System Folder. Find the following items and drag them to the trash.

StarNine (folder)
PowerTalk Setup Preferences
PowerTalk Startup Preferences

Step 3

Find the "Mail*Link Extras" folder, on the top level of your hard drive.
Drag this folder to the trash.

Step 4

Restart your machine. After you have restarted, choose "Empty Trash" from the Special menu.

Step 5

Double-click the installer for the desired software, and click Install at the Easy Install screen. After the installation is complete, your machine will restart. If you are installing more than one gateway, repeat this step for each gateway.

Step 6

Open the keychain and click "Add". Select the gateway from the list of choices. A new item will be added to the Key Chain. Open this key, and configure the gateway as you normally would. The gateway should now be functioning.

MANUAL INSTALLATION INSTRUCTIONS

=====

The manual installation instructions are for advanced users who wish to build their own installation process or who wish to install only portions of this gateway. Installation using this process should be conducted only after you fully understand how to use your Macintosh, and how to configure and use PowerTalk gateways.

If you must install this version manually, please follow these instructions:

Step 1

Place the distribution diskette in the floppy drive.

Step 2

Open the folder named "Drop Contents on System Folder".

Step 3

Select all of the items in this folder and drag them onto the "System Folder" icon.

Step 4

You will be presented with a dialog box that indicates these files belong in special locations. Click "OK".

Step 5

Close the "Drop Contents on System Folder" folder.

Step 6

Open the folder named "Place Contents in Preferences Folder".

Step 7

Select all of the items in this folder and drag them into the "Preferences" folder (which is located within your "System Folder").

Step 8

If you are presented with a dialog indicating that you will be replacing existing files, click cancel. You should perform the "Automatic Installation" procedure (above).

Step 9

Reboot the system. This is necessary because some of the software installed is only activated at boot time.

Note: With version 1.6 it is no longer required to install the key files.

KNOWN INCOMPATIBILITIES

=====

- When a mail message is forwarded, the name and address of the original sender are not preserved.
- CE Software's QM for AOCE may be used to send mail, although you must select the AppleMail format when sending the message. This application may NOT be used as the default mail reader. If it is selected, AppleMail will be used instead.

SUPPORT

=====

If you need any additional help installing, configuring or using this gateway please call Apple Support at: 1 (800) SOS - APPL

PowerTalk: Mail*Link PowerTalk to MS Mail Read Me File (10/95)

Revised: 10/19/95
Security: Everyone

PowerTalk: Mail*Link PowerTalk to MS Mail Read Me File (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

This article contains the ReadMe file included with the Mail*Link PT/MS for PowerTalk gateway software posted online.

DISCUSSION -----

Mail*Link for PowerTalk/MS 1.6

Mail*Link PT/MS for PowerTalk is a personal e-mail gateway for PowerTalk users. This gateway will allow PowerTalk users to send and receive mail into the StarNine Mail system or, as formerly known, Microsoft Mail for AppleTalk system. Mail can be sent and read with any PowerTalk mail-enabled application.

This release of Mail*Link for PowerTalk/MS is the first release of this gateway by Apple Computer Inc. This gateway is functionally equivalent to version 1.0.0. Future versions of this software will be modified and enhanced.

This software is licensed to you under the Macintosh System 7.5 license agreement. All terms and conditions of this license must be followed.

Note: If you are upgrading from version 1.0.0 it is VERY IMPORTANT that you follow the instructions in the Upgrading Section below.

The installation and upgrade procedure for this software will still install the StarNine demonstration key files (which were part of the 1.0.0 release). However the 1.6 release of the gateway has been modified to ignore the key files and thus will never expire.

To use the PT/MS gateway you must have the Microsoft Mail Extension installed in the Extensions folder of your System folder. The Microsoft Mail Extension is part of Microsoft Mail for AppleTalk. Please refer to the PT/MS User Guide for more information.

ITEMS OF NOTE

=====

- Power PC: If you are using a Power PC, turn off the modern memory manager before installing PT/MS. After you have completed the gateway configuration described in Chapter 2 and are sure that the gateway is working properly, turn the modern memory manager back on. See "Power PC issues" on page 52 of the manual for related information.
- Gateway Operation: When you activate the PT/MS gateway, it uses the MS Mail extension to log in to the MS Mail Server specified in the Key Chain configuration window. It then sends pending mail from your Out Tray to the Server and transfers mail from your account on the Server to your PowerTalk In Tray at regular specified intervals until you deactivate the gateway or turn off your Macintosh. This process all takes place in background. While the MS Mail extension is actively communicating with the MS Mail Server, your Macintosh is temporarily unavailable for other tasks. This translates into slight freezes from time to time as you are going about your normal tasks as PT/MS logs into the server, with more significant hangups lasting a couple of seconds during large file transfers between the local disk and MS Mail Server. If the MS Mail Server is on a physically remote network or a large, busy network, the process of logging in to the Server will take longer. Increasing the interval at which you contact the MS Mail Server will mitigate hangups (An interval less than three or four minutes will hang your machine up in continual PowerTalk processing leaving no time for your machine to do anything else. We recommend a connection interval of at least five minutes).

INSTALLATION INSTRUCTIONS

=====

For new installations only:

We recommend that you install this software via the installer script.

Step 1

Double click on either the "Installer" icon.

Step 2

Select the drive on which you wish to install this software and click Install.

Step 3

Reboot the system after the software has been properly installed.

UPGRADE INSTRUCTIONS

=====

If you are upgrading from a previous release of Mail*Link PT/MS for PowerTalk, you should follow these instructions:

Step 1

Install the software as instructed in the section "GETTING STARTED - Installing Mail*Link PT/MS".

Step 2

After the system has rebooted, open the "PowerTalk Key Chain".

Step 3

Open the PT/MS personal gateway in the key chain.

The installation procedures change the file-id that PowerTalk uses to locate the Mail*Link PT/MS file. Opening and closing the PT/MS Service configuration window will cause the new file-id to be written into the PowerTalk configuration file.

Step 4

Close the key chain.

You will be told that you must reboot the system before PowerTalk will activate the gateway.

Step 5

Reboot the system.

If you have trouble with the gateway after upgrading please re-install by following the instructions in the Clean Upgrade Install section below.

CONFIGURATION

=====

Creating your PT/MS personal gateway

Once you have installed the software and rebooted the system (as described above), follow these instructions to create your PT/MS personal gateway.

Step 1

Open the "Key Chain" located on your desktop.

Step 2

Press the "Add" button.

Step 3

You will be presented with a list of services that are available. Select "Microsoft Mail Service".

Step 4

A new item with the server name of "Not Configured" and a service type of "Microsoft Mail Service" will appear in your "Key Chain".

Step 5

Proceed to the "Configuring" section below.

Configuring your PT/MS personal gateway

Before configuring, make sure that you have selected your MS Mail server in the Chooser. If you do not select this the PT/MS gateway will not be able to connect.

To configure the PT/MS personal gateway, ensure that the "Key Chain" has been opened.

Step 1

Double click (Open) the item with a service type of "Microsoft Mail Service". The PT/MS personal gateway only allows one instantiation, so there should only be one item with this type in the Key Chain window.

Step 2

A configuration window will be displayed. You should configure each item in this window before closing the window. Window closing is equivalent to pressing the "OK" button in a dialog. The "Key Chain" configuration windows have no "Cancel" operation, so please ensure each item is properly filled in before closing the window (you can always come back and change the selections at a later date, but it is better if each item is properly filled in).

Step 3

Once you have entered the information in the configuration window, close the window with a mouse click in the close box or by typing "<command>W". It may take a few seconds for the window to close. This is because PowerTalk is activating all of the personal gateway subsystems and informing them of their new configuration. Be patient.

Step 4

Once the PT/MS configuration window is closed, close the Key Chain window.

CLEAN UPGRADE INSTALLATION

=====

Use this procedure if you are experiencing problems with the gateway software. You should not need to use this procedure for normal installs. To perform a "Clean Install" of the gateway software, use the following procedure.

NOTE: Some gateways may remove mail from your In Tray and Out Tray when they are reinstalled. Be sure to back up any items in your InTray and OutTray by dragging them to another folder on your hard drive.

NOTE: This will remove all services from your keychain, so be sure you have the passwords for these services handy. If you have personal gateways already

installed, you will need to set them up again, so be sure you write down the setup information that is contained in each key, if necessary.

This procedure removes all "Mail*Link" gateways. If you have multiple "Mail*Link" gateways installed, you will need to re-install each of the gateways you want to use.

Step 1

Open the Extensions folder, located inside the System Folder. Find the following item(s) and drag to the trash (note only the gateways you have installed will be in the Extensions folder):

- Mail*Link PT/QM
- Mail*Link PT/MS
- Mail*Link PT/INET

Step 2

Open the Preferences folder, located inside your System Folder. Find the following items and drag them to the trash.

- StarNine (folder)
- PowerTalk Setup Preferences
- PowerTalk Startup Preferences

Step 3

Find the "Mail*Link Extras" folder, on the top level of your hard drive. Drag this folder to the trash.

Step 4

Restart your machine. After you have restarted, choose "Empty Trash" from the Special menu.

Step 5

Double-click the installer for the desired software, and click Install at the Easy Install screen. After the installation is complete, your machine will restart. If you are installing more than one gateway, repeat this step for each gateway.

Step 6

Open the keychain and click "Add". Select the gateway from the list of choices. A new item will be added to the Key Chain. Open this key, and configure the gateway as you normally would. The gateway should now be functioning.

MANUAL INSTALLATION INSTRUCTIONS

=====

The manual installation instructions are for advanced users who wish to build their own installation process or who wish to install only portions of this

gateway. Installation using this process should be conducted only after you fully understand how to use your Macintosh, and how to configure and use PowerTalk gateways.

If you must install this version manually, please follow these instructions:

Step 1

Place the distribution diskette in the floppy drive.

Step 2

Open the folder named "Drop Contents on System Folder".

Step 3

Select all of the items in this folder and drag them onto the "System Folder" icon.

Step 4

You will be presented with a dialog box that indicates these files belong in special locations. Click "OK".

Step 5

Close the "Drop Contents on System Folder" folder.

Step 6

Open the folder named "Place Contents in Preferences Folder".

Step 7

Select all of the items in this folder and drag them into the "Preferences" folder (which is located within your "System Folder").

Step 8

If you are presented with a dialog indicating that you will be replacing existing files, click cancel. You should perform the "Automatic Installation" procedure (above).

Step 9

Reboot the system. This is necessary because some of the software installed is only activated at boot time.

Note: With version 1.6 it is no longer required to install the key files.

KNOWN INCOMPATIBILITIES

=====

- PT/MS and MailSwitch: Running the MS Mail MailSwitch utility simultaneous with gateway operation has been reported producing odd behavior, particularly, PT/MS reports a -1981 error in its log on a mail message send. A restart should cure the confusion.

- PT/MS and RAM-Doubler: There have been some reports of inconsistencies running PowerTalk and PMSAMs with RAM-Doubler.

- When a mail message is forwarded, the name and address of the original sender are not preserved.

- CE Software's QM for AOCE may be used to send mail, although you must select the AppleMail format when sending the message. This application may NOT be used as the default mail reader. If it is selected, AppleMail will be used instead.

SUPPORT

=====

If you need any additional help installing, configuring or using this gateway please call Apple Support at: 1 (800) SOS - APPL

PowerTalk: Mail*Link QuickMail to PowerTalk Read Me File (10/95)

Revised: 10/19/95
Security: Everyone

PowerTalk: Mail*Link QuickMail to PowerTalk Read Me File (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

This article contains the ReadMe file included with the Mail*Link for PowerTalk/QM gateway software posted online.

DISCUSSION -----

Mail*Link for PowerTalk/QM 1.6

This is a personal gateway for PowerTalk users. This gateway will allow PowerTalk users to send and receive mail from their QuickMail accounts without having to login to QuickMail and use the QuickMail DA. Mail can be sent and read with your favorite PowerTalk mail enabled application.

This release of Mail*Link for PowerTalk/QM is the first release of this gateway by Apple Computer Inc. This gateway is functionally equivalent to version 1.0.5. Future versions of this software will be modified and enhanced.

This software is licensed to you under the Macintosh System 7.5 license agreement. All terms and conditions of this license must be followed.

Note: If you are upgrading from version 1.0.5 or earlier it is VERY IMPORTANT that you follow the instructions in the Upgrading Section below.

The installation and upgrade procedure for this software will still install the StarNine demonstration key files (which were part of the 1.0.5 release). However the 1.6 release of the gateway has been modified to ignore the key files and thus will never expire.

INSTALLATION INSTRUCTIONS

=====

For new installations only:

We recommend that you install this software via the installer script.

Step 1

Double click on either the "Installer" icons.

Step 2

Select the drive on which you wish to install this software.

Step 3

Reboot the system after the software has been properly installed.

UPGRADE INSTRUCTIONS

=====

If you are upgrading from a previous release of Mail*Link PT/QM, you should follow these instructions:

Step 1

Install the software as instructed in the section "INSTALLATION INSTRUCTIONS".

Step 2

After the system has rebooted, open the "PowerTalk Key Chain".

Step 3

Open the QuickMail personal gateway in the key chain. The installation procedures change the file-id that PowerTalk uses to locate the Mail*Link PT/QM file. Opening and closing the QuickMail Service configuration window will cause the new file-id to be written into the PowerTalk configuration file.

Step 4

Close the key chain. You will be told that you must reboot the system before PowerTalk will activate the gateway.

Step 5

Reboot the system.

If you have trouble with the gateway after upgrading please re-install by following the instructions in the Clean Upgrade Install section below.

CONFIGURATION

=====

Creating your QuickMail personal gateway

Once you have installed the software and rebooted the system (as described

above), follow these instructions to create your QuickMail personal gateway.

Step 1

Open the "Key Chain" located on your desktop.

Step 2

Press the "Add" button.

Step 3

You will be presented with a list of services that are available. Select "QuickMail".

Step 4

A new item with the server name of "Not Configured" and a service type of "QuickMail" will appear in your "Key Chain".

Step 5

Proceed to the "Configuring" section below.

Configuring your QuickMail personal gateway

To configure the QuickMail personal gateway, ensure that the "Key Chain" has been opened.

Step 1

You first need to select your QuickMail directory service. To do this: open the Chooser, choose QuickMessenger, select the directory service and close the Chooser.

Step 2

Double click (Open) the item with a service type of "QuickMail". The QuickMail personal gateway only allows one instantiation, so there should only be one item with this type in the Key Chain window.

Step 3

A configuration window will be displayed. You should configure each item in this window before closing the window. Window closing is equivalent to pressing the "OK" button in a dialog. The "Key Chain" configuration windows have no "Cancel" operation, so please ensure each item is properly filled in before closing the window (you can always come back and change the selections at a later date, but it is better if each item is properly filled in).

Step 4

Once you have entered the information in the configuration window, close the window with a mouse click in the close box or by typing "<command>W". It may take a few seconds for the window to close. This is because PowerTalk is activating all of the personal gateway subsystems and informing them of their new configuration. Be patient.

Step 5

Once the QuickMail configuration window is closed, close the Key Chain window.

CLEAN UPGRADE INSTALLATION

=====

Use this procedure if you are experiencing problems with the gateway software. You should not need to use this procedure for normal installs. To perform a "Clean Install" of the gateway software, use the following procedure.

NOTE: Some gateways may remove mail from your In Tray and Out Tray when they are reinstalled. Be sure to back up any items in your InTray and OutTray by dragging them to another folder on your hard drive.

NOTE: This will remove all services from your keychain, so be sure you have the passwords for these services handy. If you have personal gateways already installed, you will need to set them up again, so be sure you write down the setup information that is contained in each key, if necessary.

This procedure removes all "Mail*Link" gateways. If you have multiple "Mail*Link" gateways installed, you will need to re-install each of the gateways you want to use.

Step 1

Open the Extensions folder, located inside the System Folder. Find the following item(s) and drag to the trash (note only the gateways you have installed will be in the Extensions folder):

- Mail*Link PT/QM
- Mail*Link PT/MS
- Mail*Link PT/INET

Step 2

Open the Preferences folder, located inside your System Folder. Find the following items and drag them to the trash.

- StarNine (folder)
- PowerTalk Setup Preferences
- PowerTalk Startup Preferences

Step 3

Find the "Mail*Link Extras" folder, on the top level of your hard drive. Drag this folder to the trash.

Step 4

Restart your machine. After you have restarted, choose "Empty Trash" from the Special menu.

Step 5

Double-click the installer for the desired software, and click Install at the Easy Install screen. After the installation is complete, your machine will restart. If you are installing more than one gateway, repeat this step for each gateway.

Step 6

Open the keychain and click "Add". Select the gateway from the list of choices. A new item will be added to the Key Chain. Open this key, and configure the gateway as you normally would. The gateway should now be functioning.

MANUAL INSTALLATION INSTRUCTIONS

=====

The manual installation instructions are for advanced users who wish to build their own installation process or who wish to install only portions of this gateway. Installation using this process should be conducted only after you fully understand how to use your Macintosh, and how to configure and use PowerTalk gateways.

If you must install this version manually, please follow these instructions:

Step 1

Place the distribution diskette in the floppy drive.

Step 2

Open the folder named "Drop Contents on System Folder".

Step 3

Select all of the items in this folder and drag them onto the "System Folder" icon.

Step 4

You will be presented with a dialog box that indicates these files belong in special locations. Click "OK".

Step 5

Close the "Drop Contents on System Folder" folder.

Step 6

Open the folder named "Place Contents in Preferences Folder".

Step 7

Select all of the items in this folder and drag them into the "Preferences" folder (which is located within your "System Folder").

Step 8

If you are presented with a dialog indicating that you will be replacing existing files, click cancel. You should perform the "Automatic Installation" procedure (above).

Step 9

Reboot the system. This is necessary because some of the software installed is only activated at boot time.

Note: With version 1.6 it is no longer required to install the key files.

KNOWN INCOMPATIBILITIES

=====

- When forwarding a mail message, the name and address of the original sender of the message is not preserved.
- When forwarding a message, the form content of the forwarded message is lost unless you type at least 1 character into the forwarded message.

SUPPORT

=====

If you need any additional help installing, configuring or using this gateway please call Apple Support at: 1 (800) SOS - APPL

Pantone for AppleVision: Read Me File (10/95)

Revised: 10/18/95
Security: Everyone

Pantone for AppleVision: Read Me File (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

This article contains the ReadMe file included with the Pantone color picker module for the AppleVision 1710 AV display posted online.

DISCUSSION -----

PANTONE Color Picker for the AppleVision Color Display

The PANTONE Color Picker consists of a self contained Macintosh system extension. This extension is an extensible color picker module which displays calibrated PANTONE Colors from the PANTONE MATCHING SYSTEM. It will display the PANTONE Colors in three modes:

PANTONE MATCHING SYSTEM - As printed as a spot ink on a coated paper stock
PANTONE MATCHING SYSTEM - As printed as a spot ink on uncoated paper stock
PANTONE MATCHING SYSTEM - As reproduced in four-color process ("Spot to Process")

System requirements are: ColorSync 2.0 Apple Color Picker Extension
ICC/ColorSync 2.0 Monitor profiles

Installation
=====

Assuming you have ColorSync 2.0 and the Apple Color Picker extensions installed on your Macintosh, copy the PANTONE Color Picker extension into the Extensions folder within your System Folder. Then copy the ColorSync/ICC source profile into your ColorSync Profiles folder inside the Preferences folder. The source profile is named Pantone XYZ Source Profile and ensures that the purest PANTONE Color information is processed by ColorSync and your new AppleVision monitor.

Restart your Macintosh prior to using the Color Picker.

How to load the PANTONE Color Picker

=====

You can use the PANTONE Color Picker anytime the built-in Macintosh Color Picker is called by software running on your Macintosh. When the Color Picker is called, a dialog box such as the one shown below will appear.

When you exit the dialog box by clicking the OK button, the color value you selected is returned to the calling application or utility.

Setting the Display Profile

=====

You will need to tell the PANTONE Color Picker what monitor profile you want to use. Select your monitor type in the pop-up list under Profile: You new AppleVision Color display ships with software which enables you to re calibrate you monitor at any time and create a current ColorSync profile. If you use this software, make sure you save the profile in the ColorSync Profiles folder prior to loading the Color Picker.

Selecting a PANTONE Color Mode

=====

The PANTONE MATCHING SYSTEM is provided in three different flavors. You can obtain display simulations of PANTONE Colors as they would appear printed on Coated Paper, Uncoated Paper and as printed in four-color process on Coated stock. You will notice that the appearance of the colors change when you select each of the three modes.

Selecting a PANTONE Color

=====

To choose a PANTONE Color you can type the number in the edit field below the horizontal scroll bar. Or you can simply scroll through the colors until you find one you like. Additionally, you can click on the vertical multi-colored bar on the right side of the PANTONE Color display to jump to a particular color range.

Computer Displays _ Additive Color Mixing

=====

Additive color mixing is the basis for non-reflective sources such as computer monitors and televisions. Non-reflective sources are actually light sources, and each pixel on a color computer display is a separate light source.

Each pixel on a computer display is composed of three "cells," each of which is coated with a different type of phosphor. One type of phosphor emits bluish light when it is bombarded with electrons, one emits greenish light, and the third emits reddish light. In theory (though not quite in practice), each of these phosphors operate independently of the others. The intensity of the light emitted by each phosphor more or less depends on the intensity of the electron beam bombarding it. The color of the pixel results by adding together the light emitted by each of these phosphors.

The relationship between the intensity of the beam and the light emitted by the phosphor is only approximate and indirect. This can cause real problems for those who wish to display accurate and repeatable colors.

A factor that can effect color accuracy on a monitor is called "gamma". Gamma occurs because the intensity of light emitted by the pixel phosphors is not directly proportional to the number of electrons hitting them. Actually, the brightness emitted varies with a number that is between the square of the number of electrons and the cube of that number. For example, the monitor has a gamma of 2.6. This means that the brightness of the light emitted by a phosphor on that monitor is proportional to the number of electrons hitting it raised to the 2.6 power.

In order to ensure consistent color reproduction, all video cards for Macintosh displays have "average gamma correction" tables stored on-board the card. If the monitor response is measured and recorded in such a table, the monitor will be able to consistently reproduce colors.

Color Gamuts

=====

Each set of color primaries (RGB, CMY) define a "color space" that includes all colors that can result from any combination of these primaries. The "color space," or "color gamut," may be quite different for different sets of primaries. Typically, a CMY color gamut falls inside (is smaller) a RGB color gamut, which means that the eye can detect (or a monitor can display) more colors than a printer can print. In other words, it is not possible to print some colors that can be photographed or displayed on a monitor when using CMYK printing.

Some of the PANTONE Colors do not fall within the RGB color gamut for particular monitors because the primaries (or phosphors sets) are much more saturated than those that define the RGB gamut for particular phosphor sets. RGB color gamuts vary as well. For example, the color gamut for one monitor may be quite different from the color gamut for another, since the phosphor set that produces the RGB primaries, the gamma correction and other variables for the monitors may be different.

PowerBook: Liquid Crystal Display Refresh Rates (11/95)

Revised: 11/7/95
Security: Everyone

PowerBook: Liquid Crystal Display Refresh Rates (11/95)

=====

Article Created: 18 October 1995
Article Reviewed/Updated: 7 November 1995

TOPIC -----

What are the refresh rates for the displays in the Macintosh PowerBook 5300, 2300, and 190 series computers (both Active and passive matrix, color and grayscale)? How does this compare to the display on my desktop system?

DISCUSSION -----

This article provides general information on display refresh rates used in Macintosh PowerBook computers. However, it is difficult to compare Cathode Ray Tubes (CRTs), used with desktop Macintosh computers, to passive and active matrix Liquid Crystal Displays (LCDs), used in PowerBook computers, because it is an entirely different technology. To complicate things further, the two types of LCDs use two totally different technologies to create the image on the screen.

Active Matrix -----

Active matrix displays, also called Thin-Film Transistor (TFT), have transistors that are individually addressed and charged. The amount of time that it takes for the charge to diminish is somewhere around 20 milliseconds (ms). We currently use a refresh rate of 62Hz on all (color and grayscale) TFT displays which means that each row of pixels gets refreshed every 16ms.

Passive Matrix -----

Passive matrix displays, also called Film SuperTwisted Nematic (FSTN), are even better in that aspect. Once their pixels receive a charge, the time it takes for the pixel to lose its charge can be measured in seconds. In fact, the fastest time that the computer can turn a pixel off is over 60ms. The passive matrix screens use a refresh rate of 73Hz for grayscale passive matrix (MFSTN) displays and 79Hz for color passive matrix (CFSTN) displays, each row of pixels is refreshed every 12ms.

Apple Remote Access MultiPort Server 2.1: Description (3/96)

Revised: 3/12/96
Security: Everyone

Apple Remote Access MultiPort Server 2.1: Description (3/96)

Article Created: 13 October 1995
Article Reviewed/Updated: 12 March 1996

TOPIC -----

This article describes Apple Remote Access (ARA) MultiPort Server 2.1.

DISCUSSION -----

The Apple Remote Access MultiPort Server provides a flexible, scalable, and secure way to offer network access to large numbers of remote or mobile users. Used in conjunction with one or more Apple Remote Access Serial Cards, it allows a Macintosh computer or a Workgroup Server to support from 4 to 16 simultaneous dial-up connections*. This provides an ideal solution for workgroups or entire organizations that want to enable employees to work productively and efficiently no matter what their location -- whether they're at home, out of town, or even out of the country.

Unlike conventional complex server software, the Apple Remote Access MultiPort Server is designed to streamline administrative tasks, while maximizing administrator productivity and control. The software installs in minutes and features sophisticated management capabilities, including industry-standard Simple Network Management Protocol (SNMP) support. This allows administrators to flexibly manage and maintain connections. Adding ports is simple, and the server features an automatically generated activity log that can be exported to a variety of programs for further analysis.

On the client side, the Apple Remote Access Client for Macintosh software is also designed with efficiency and productivity in mind. From its single-step installation to such productivity-enhancing features as full System 7 integration and extensive connection-management capabilities, it provides everything users need to help them get their work done easily and efficiently -- wherever they are.

Users can also be confident that their work will be secure. The Apple Remote Access MultiPort Server offers a host of sophisticated security features that

allow administrators to maintain the integrity of the network. These features -- such as password aging, location validation, and the ability to filter access to services -- make it one of the most secure remote access servers available. And because its security architecture is supported by leading third-party security vendors, administrators can choose to augment the server's built-in security features with additional challenge-and-response security modules.

Features

Ease of installation and use

- Takes only minutes to set up a server and to add users or ports as needed
- Provides built-in context-sensitive help

Multilevel security

- Provides a variety of sophisticated security features, making it one of the most secure remote access servers available
- Is supported by leading third-party security vendors, so administrators can choose to augment its built-in capabilities with additional security modules

Scalable solution

- Allows a Macintosh computer, Power Macintosh computer, or a Workgroup Server to support from 4 to 16 simultaneous dial-up connections*
- Runs on a variety of Macintosh computers, so you can choose the system that's appropriate for your needs

Powerful administrative capabilities

- Allows flexible port configurations
- Offers comprehensive user-management facilities
- Supports industry-standard SNMP
- Tracks resource usage and automatically generates an activity log that can be exported for further analysis

Flexible client capabilities

- Supports a variety of connections, including cellular and ISDN**
- Is fully integrated with Macintosh System 7, so remote users can work with such familiar tools as the Chooser, Aliases, and the Finder

* The Apple Remote Access MultiPort Server includes support for 4 ports and is available for Macintosh and Power Macintosh computers and Workgroup Servers (Mac OS-based). Support for 8, 12, or 16 ports requires purchase of 1, 2, or 3 Apple Remote Access MultiPort Server Kits respectively.

** ISDN and cellular connections require additional Apple or third-party products.

Article Change History:

12 Mar 1996 - Changed distribution status.

ARA MultiPort Server 2.1: Technical Specifications (1/96)

Revised: 1/26/96
Security: Everyone

ARA MultiPort Server 2.1: Technical Specifications (1/96)

Article Created: 13 October 1995
Article Reviewed/Updated: 26 January 1996

TOPIC -----

This article provides the technical specifications for Apple Remote Access MultiPort Server 2.1.

DISCUSSION -----

Technical Specifications

Administrator control and monitoring

- Ability to monitor and manage server activity by port and user
- Ability to broadcast messages or send them to selected users
- Ability to adjust connection time by user
- Ability to disconnect any single user or all users
- Built-in Simple Network Management Protocol (SNMP), enabling you to monitor the server from any SNMP-based network management station

Security

- User name and password authentication
- Adjustable password length
- Filtering of network services by account
- Ability to disallow client use of Save Password option
- Account disable after specified number of password failures
- Password aging
- External security architecture (for example, for providing challenge-and-response authentication through a third-party security module)
- Call back feature that verifies the user's identity by returning calls to a predetermined phone number
- Activity log for recording user and server activities
- Administrative password option

Modem support and scripts

- Supports any Hayes-compatible 9,600-bps or higher speed modem with the appropriate script. Modem scripts for many popular modems are included:
 - V.fast modems: Motorola Codex 3260 Fast
 - V.32bis modems (14,400 bps): Hayes Ultra 144, Motorola Codex 3260, US Robotics Courier V.32bis
 - V.32 modems (9,600 bps): Hayes Ultra 96, Telebit T1600, UDS/Motorola 3225, UDS/Motorola 3227, US Robotics Sportster, US Robotics Worldport
 - V.34 modems (28,800 bps): US Robotics, V.Everything, SupraFax 28.8
- ISDN support: Hayes ISDN adapter
- 9,600-bps or higher-speed scripts included with the Apple Remote Access Client for Macintosh can also be used with the Apple Remote Access MultiPort Server
- Additional scripts may be available. Contact an authorized Apple reseller or representative or your modem manufacturer for more details.
- Administrators or other programmers familiar with connection control languages (CCLs) can also write the necessary scripts using the Apple Remote Access Modem Scripting Guide and Modem Workshop software, which are included with the Apple Remote Access MultiPort Server.

Network types supported

- Support for any AppleTalk network; the most common network choices include:
 - LocalTalk
 - Ethernet
 - Token Ring

Connection types supported

- Support for a range of connection types:
 - Standard telephone
 - Cellular*
 - ISDN*

Error detection/data compression

- Includes several built-in components that allow for error-free and optimized delivery of data
 - Smart buffering (developed by Apple Computer, Inc.) for data-transfer optimization
 - MNP, an industry standard for error detection
 - V.42bis, an industry standard for data compression

Specifications

- Maximum number of simultaneous connections: 16
- User name maximum length: 31 characters
- Password maximum length: 8 characters
- Total number of user records: 8,192
- Maximum connect time: selectable
- Maximum number of activity log entries: 32,767

Licensing information

- Comes with license to install Apple Remote Access MultiPort software on a single Macintosh and to install Apple Remote Access Client for Macintosh software on up to four systems
- Additional client software must be purchased or licensed separately;

consult your authorized Apple reseller or representative for information.

Operating requirements

For the server

- A Macintosh computer with one or more NuBus slots and at least 5MB of RAM, a Power Macintosh computer, or a Workgroup Server. For configurations with more than four ports, additional memory is required, and a high-performance system is recommended.
- Macintosh system software version 7.0 or later (version 7.1 or later recommended)
- A hard disk drive and an Apple SuperDrive floppy disk drive
- Apple Remote Access Serial Card
- One or more Hayes-compatible 9,600 bps/V.32 or higher-speed modems
- Apple Remote Access Client for Macintosh

For the client

- A Macintosh Plus or later model with at least 4MB of RAM or a Power Macintosh computer
- Macintosh system software version 7.0 or later
- A hard disk drive
- An Apple or other Hayes-compatible modem (2,400 bps minimum; 9,600 bps or higher recommended) and appropriate modem cable, if needed

* ISDN or cellular support requires additional third-party products.

Ordering Information

Apple Remote Access MultiPort Server

Order No. M5214Z/C

- Apple Remote Access MultiPort Server software and installer (includes support for four ports)
- Apple Remote Access Client for Macintosh software and installer (with license to install software on up to four client systems); additional client software can be purchased separately
- Apple Remote Access Serial Card

Apple Remote Access Client for Macintosh (single-pack)

Order No. M5227Z/B

Apple Remote Access Client for Macintosh (10-Pack)

Order No. M2692Z/B

Apple Remote Access Client for Macintosh (Volume Licensing)

Client software can be volume licensed separately for quantities of 50 or more users; consult your authorized Apple reseller or representative for purchasing information.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

ARA MultiPort Server 2.1 & 2.0 Differences (1/96)

=====

Article Created: 13 October 1995
Article Reviewed/Updated: 26 January 1996

TOPIC -----

How does Apple Remote Access (ARA) MultiPort Server 2.1 differ from 2.0, and how will ARA MultiPort Server 2.1 affect 2.0 clients?

DISCUSSION -----

Here are the differences:

- Software includes bug fixes for improved server stability
- New short NuBus serial card fits all Macintosh NuBus systems
- Lower price
- No longer supports X.25 connections

The ARA MultiPort Server 2.1 lets ARA 2.0 and 1.0 clients connect. Users will notice no difference when connecting.

Open Transport and PPP: Frequently Asked Questions (11/95)

=====

Article Created: 19 October 1995
Article Reviewed/Updated: 15 December 1995

TOPIC -----

This article includes Frequently Asked Questions (FAQ) about Open Transport and point-to-point protocol (PPP).

Questions in this FAQ:
=====

- 1) Is Open Transport compatible with existing Internet Service Providers?
- 2) Which mdevs are currently supported?
- 3) Doesn't Apple offer a solution for SLIP or PPP dial-up to the Internet?
- 4) Does the Apple Internet Connection Kit require Open Transport?
- 5) If I need an updated copy of one of these mdevs, how can I get the software?
- 6) Are there other known limitations to backward compatibility mdev support?
- 7) Is there documentation available to assist with configuring Open Transport/TCP?
- 8) What additional updates are planned for Open Transport to improve compatibility with dial-up internet access?
- 9) When will Open Transport 1.1 be available?
- 10) Will Apple provide a SLIP or PPP solution for Open Transport?

DISCUSSION -----

- 1) Question: Is Open Transport compatible with existing Internet Service

Providers?

Answer: Open Transport/TCP currently supports dial-up connectivity to TCP/IP networks, including the Internet, through backward compatibility with select third party software models know as "mdevs".

With the appropriate mdev software installed, end-nodes can use either Serial Line Internet Protocol (SLIP) or PPP to connect to Internet Service Providers and other dial-up IP-access points. However, not all versions of all mdevs are supported by Open Transport backward compatibility services. It is important that the recommended versions of software be installed for the greatest level of compatibility.

2) Question: Which mdevs are currently supported?

Answer: Open Transport 1.0.7 works with the following MacTCP Link Access Modules (mdevs), with these known caveats.

- FreePPP - version 1.0 or more recent; compatible with Open Transport.
- InterSLIP - Version 1.0.1 is not compatible with Open Transport, you need a later version. InterCon should be contacted directly.
- InterPPP - use version 1.2.9 or more recent.
- InterPPP II - use the most current version.
- MacSLIP - use version 3.0 or more recent; compatible with Open Transport.
- MacPPP - use version 2.1.3sd or more recent (2.2.0 not recommended).

Apple is continuing to work with developers to better support existing mdevs; contact the third party developer of interest for the most recent information on compatibility.

3) Question: Doesn't Apple offer a solution for SLIP or PPP dial-up to the Internet?

Answer: The Apple Internet Connection Kit is a selection of the most popular Internet applications from third party companies, including the Netscape Navigator and RealAudio Player from Progressive Networks, as well as Claris EMailer Lite.

The kit includes MacPPP 2.1.4 along with the Apple Internet Dialer - software designed to make it simpler for Macintosh customers to register with a qualified Internet Service Provider (ISP) and get connected to the Internet. To help users work with their Internet applications, the Apple Internet Connection Kit includes Apple Guide software for on-line assistance.

4) Question: Does the Apple Internet Connection Kit require Open Transport?

Answer: No, the Apple Internet Connection Kit works with either MacTCP 2.0.6 or with Open Transport/TCP 1.0.7 or later.

5) Question: If I need an updated copy of one of these mdevs, how can I get the software?

Answer: Sources for mdev software will vary, as some of the recommended products are commercial and some are shareware or public domain.

- FreePPP is shareware and can be found on a variety of internet sites; typically at "info-mac" mirror sites in the comm/tcp directory. A list of info-mac mirror sites can currently be found at:

<http://www.mcp.com.hayden/iskm/info-mac-mirrors.html>

Some sites where FreePPP can be found as of Oct. 1995 include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/>
<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/>

- InterSLIP is public domain software developed by InterCon Systems, and is currently available from:

<ftp://ftp.intercon.com/InterCon/sales/InterSLIP/>

- InterPPP and InterPPP II are commercial software products. For availability and ordering information contact InterCon Systems.

- MacSLIP is commercial software available developed by Hyde Park Software. For availability and ordering information contact TriSoft.

- MacPPP (v2.1.4) is available as a component of the Apple Internet Connection Kit, Apple Computer Inc., US 1-800-462-4396 for fax information or 1-800-538-9696 to locate an Apple authorized reseller near you.

The Tech Info Library article titled "Locating Vendor Information" can help you search for InterCon Systems' and TriSoft's address and phone number.

6) Question: Are there other known limitations to backward compatibility mdev support?

Answer: Yes. Due to differences in the underlying architectures between MacTCP and Open Transport/TCP, and some current shortcomings in the backward compatibility services, there are some additional limitations to mdev support:

- Some mdevs, when used with Open Transport, may not be able to auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application. This is being addressed by updated versions of mdevs.

- Some Internet Service Provider do not strictly follow standards practices, which call for assigning end-node IP addresses on the same subnet as the router (gateway). Open Transport strictly enforces this requirement in versions prior to 1.0.7. Beginning with Open Transport 1.0.7, the TCP/IP configuration utility software will automatically generate a compatible router address to facilitate connectivity to the ISP if the user leaves the router address field empty.

- Once a TCP/IP application launches and uses a SLIP or PPP mdev, use of a different mdev may require restarting the Macintosh. Disconnecting from and redialing a service provider may also require restarting the Macintosh. This is planned to be addressed in Open Transport v1.1.

7) Question: Is there documentation available to assist with configuring Open Transport/TCP?

Answer: Yes. Although a full user's guide is planned for release with Open Transport v1.1, configuration tips for Open Transport 1.0.x are already available on various sites on the internet including:

ftp://seeding.apple.com/opentransport/OT_gen_info/TEXT/OTTCP_Config_Tips

8) Question: What additional updates are planned for Open Transport to improve compatibility with dial-up internet access?

Answer: Open Transport 1.1 is planned to include:

- Support for reconnection of a dial-up session without restart.
- Fix for a compatibility problem that could interfere with Qualcomm Eudora users sending short messages.

9) Question: When will Open Transport 1.1 be available?

Answer: Open Transport 1.1 is scheduled to be available in early 1996. For more information regarding Open Transport 1.1, please refer to:

ftp://seeding.apple.com/opentransport/OT_gen_info_/WORD/OT_QA

10) Question: Will Apple provide a SLIP or PPP solution for Open Transport?

Answer: Apple is developing an implementation of PPP for Open Transport as a part of the next generation of Apple Remote Access products. This is planned to support dial-up access to both AppleTalk and TCP/IP networks. Additional details will be announced at a later date.

Article Change History:

- 15 Dec 1995 - Updated Open Transport 1.1 release time frame.
- 22 Nov 1995 - Updated format.
- 15 Nov 1995 - Corrected InterSLIP information.

At Ease: Adding Application from Mounted Volume to Setup (10/95)

Revised: 10/19/95
Security: Everyone

At Ease: Adding Application from Mounted Volume to Setup (10/95)

=====

Article Created: 18 October 1995

TOPIC -----

I want to run a program from a file server other than the server acting as the At Ease Disk. I want to set up At Ease so that I can use the program directly from a mounted hard drive without copying it to the At Ease Disk or the At Ease workstation hard drive. How can I access a program on a mounted volume from At Ease?

DISCUSSION -----

You can run an application from a shared hard drive on your network without copying it to the client computer's hard drive or the At Ease Disk (if you are using a Workgroup version of At Ease).

Follow these steps:

Note:

The steps in this article assume you know how to share a hard drive and set user access privileges. Use the search string 'system 7 and file sharing' to locate the TIL article "System 7 File Sharing" for additional information.

At Ease 1.0

=====

Step 1

While in the Macintosh Finder, under the Apple Menu, choose the Chooser. Click the AppleShare icon on the left side of the Chooser. Double-click the name of the shared hard drive on the right side of the Chooser which contains the program you want to run.

Step 2

Type in your user name and password to mount the hard drive on your desktop.

Note:

You need to set access privileges for the users of this setup on the shared hard drive in order for them to mount the server. Each time a user of this setup clicks on the button to open the application you are adding, At Ease will bring up the standard AppleShare login dialog box before you now. You can create a 'generic' user and password or if security is not an issue, grant guest access to this folder.

Step 3

Open the At Ease Setup control panel in the Control Panels folder of your System Folder.

Step 4

Click the Select Items button.

Step 5

Click the Desktop button in the Open Dialog box. Double-click the name of the mounted hard drive that appears in the window in the left side of the Open Dialog box. Click the Gather Applications... button.

Step 6

A dialog box will appear telling you which applications are on the mounted hard drive that are not in At Ease. You will have the option to Add or Cancel. Click Add. You can remove any extra unwanted applications from the At Ease Items window by clicking each once and clicking Remove.

Step 7

Click Done, close the At Ease setup window.

At Ease 2.0.3 and At Ease 3.0

=====

Step 1

While in the Macintosh Finder, under the Apple Menu, choose the Chooser. Click the AppleShare icon on the left side of the Chooser. Double-click the name of the shared hard drive on the right side of the Chooser which contains the program you want to run.

Step 2

Type in your user name and password to mount the hard drive on your desktop.

Note:

You need to set access privileges for the users of this setup on the shared hard drive in order for them to mount the server. Each time a user of this setup clicks on the button to open the application you are adding, At Ease will bring up the standard AppleShare login dialogue box before you now. You can create a

'generic' user and password or if security is not an issue, grant guest access to this folder.

Step 3

Launch the At Ease Setup application.

Step 4

Double click the Setup you would like to add the program to.

Step 5

Click the Items icon to open the Items panel. Click the Add Applications button.

Step 5

In the Add Applications screen, you will see a choice of applications on the left side. Click and hold the words after "Disk:" at the top left corner to see the pop-up menu.

Step 6

Select the name of the mounted hard drive and release. At Ease will search for any applications on that volume.

Step 7

Double-click the name of the program you want to add to the list of Items for This Setup on the right. Or, you can hold the shift key while single-clicking each application to select multiple items and then click the ">>Add>>" button. Repeat this process until you have added all the programs you want from the mounted volume.

Step 8

Click the "OK" button and follow the rest of the steps as necessary to set up At Ease the way you like.

When you return to At Ease, you will see the button for the application you added in the At Ease panel. If you click the button and the hard drive is not already mounted, the login window appears prompting you to enter a user name and password or to connect as a guest.

DOS Compatibility Card: Can't Quit PC Print Spooler (10/95)

Revised: 10/19/95
Security: Everyone

DOS Compatibility Card: Can't Quit PC Print Spooler (10/95)

=====

Article Created: 19 October 1995

TOPIC -----

I've had problems printing from the DOS environment of my Macintosh DOS Compatible computer, and now I can't get PC Print Spooler to quit. I can get nothing at all to print from the PC environment. What is wrong, and how can I remedy it?

DISCUSSION -----

You may have a failed print job in your Spooler folder (the folder that holds queued print jobs from the PC environment). One failed print job can stop all jobs behind it from printing. In order to clear the Spooler folder, which will in turn stop the PC Print Spooler from being activated every time you start your Macintosh, follow the steps below:

Step 1

Start your Macintosh computer with extensions off by pressing the shift key. Keep pressing the shift key until the message, "Welcome to Macintosh. Extensions off." appears.

Step 2

Open the System Folder, open the Preferences folder, and locate the Spooler folder. Now throw the Spooler folder into the Trash and select the Empty Trash command from the Special menu.

Step 3

Restart your Macintosh computer. The next time a print job is sent from the PC environment, a new Spooler folder will be created, and your PC print jobs should now print normally.

DOS Compatibility Card: Resolutions, Colors in Windows (10/95)

Revised: 10/19/95
Security: Everyone

DOS Compatibility Card: Resolutions, Colors in Windows (10/95)

=====

Article Created: 19 October 1995

TOPIC -----

I have a Power Macintosh 6100 DOS Compatible computer, with a 17-inch Multiple Scan Display. What video driver should I use to get 800x600 resolution at 16 colors in Windows? Also, can I get 256 colors at 800x600? How much video RAM is there on the DOS card?

DISCUSSION -----

You should have already installed the Windows display drivers which are found on the floppy disk marked "Display Drivers" that came with your Macintosh DOS Compatible computer. If you have not, refer to page 39 of the "DOS Compatibility Card for Macintosh User's Guide," under the heading, Installing video drivers.

For 800x600 resolution at 16 colors on a 15-inch or 17-inch display, you should select the "* CHIPS 450 VGA 800x600 16 color" driver in the windows SETUP program. In the Macintosh environment, select the 832x624 resolution in the Monitors control panel. In the PC Setup control panel, under the display heading, select VGA or 16-inch. These selections will give you different results, so try both and use the one that works best for you.

The DOS Compatibility Card has 512K of video RAM. Therefore, 640x480 at 16 or 256 colors, or 800x600 at 16 colors are the only supported resolution and color depth combinations.

DOS Compatibility Card: To Find Novell Client Software (10/95)

Revised: 10/19/95
Security: Everyone

DOS Compatibility Card: To Find Novell Client Software (10/95)

=====

Article Created: 19 October 1995

TOPIC -----

I need the Novell client software in order to set up a Ethernet-based network configuration, in the PC environment of my Power Macintosh 6100 DOS Compatible computer. How much does it cost, and where can I get it?

DISCUSSION -----

Novell's server software is a retail item, but the Netware client packages are available via anonymous ftp from ftp.novell.com. The DOS/Windows client software can be found in /pub/updates/nwos/dsclnt12/. The DOS client software consists of 5 self-extracting executable files: VLMKT1.EXE, VLMKT2.EXE, VLMKT3.EXE, VLMKT4.EXE, and VLMKT5.EXE.

QuickTime Conferencing: Modems Aren't Supported (3/96)

Revised: 4/1/96
Security: Everyone

QuickTime Conferencing: Modems Aren't Supported (3/96)

=====

Article Created: 20 October 1995
Article Reviewed/Updated: 29 March 1996

TOPIC -----

Can I use QuickTime Conferencing from home through my modem?

DISCUSSION -----

Currently QuickTime Conferencing does not support dial-up (modem) connections. You need either an ISDN card, or other direct connection method to use QuickTime Conferencing. ISDN modems using a PPP/TCP/IP connection are also not supported.

This article was published in the Information Alley on 29 March 1996.

Article Change History:
29 Mar 1996 - Added information about ISDN modems not being supported.

PowerBook 5300: Disk Tools Contains Old Enabler (1/96)

Revised: 2/5/96
Security: Everyone

PowerBook 5300: Disk Tools Contains Old Enabler (1/96)

=====

Article Created: 20 October 1995
Article Reviewed/Updated: 5 February 1996

TOPIC -----

My computer is having problems charging the battery. I thought it might be software, so I turned off my computer and placed the Disk Tools Disk into the computer. Then I restarted so the System folder on the Disk Tools was used. However, the battery is still not charging, what's wrong?

DISCUSSION -----

Starting up from the Disk Tools disk is not always a good test. The Disk Tools disk only contains version 1.0.1 of the Powerbook 5300 enabler. This version of the enabler is not capable of charging Nickel Metal Hydride (NiMH) batteries only Lithium Ion (LiIon) batteries. Since the PowerBook 5300 Series computers have a NiMH battery, it doesn't get charged.

Because of disk space limitations, version enabler v1.0.1 is on the Disk Tools disk. To properly charge the NiMH battery, you must start from the system folder on your hard disk.

The PowerBook 5300 series computers ship with Nickel Metal Hydride (NiMH) batteries. For these batteries to work properly the Battery Enabler needs to be installed. Without this software the battery will appear to not be recognized by the computer.

A quick way to check for the existence of the enabler is to look in the "About this Macintosh" window in the Apple menu. The System software version should say "System Enabler 1.0.8". If it does not, the correct enabler software is not installed.

Telecom 2.3: Fax for PC Card Modems Read Me Error & Info (2/97)

Revised: 2/11/97
Security: Everyone

Telecom 2.3: Fax for PC Card Modems Read Me Error & Info (2/97)

Article Created: 20 October 1995
Article Reviewed/Updated: 11 February 1997

TOPIC -----

The Telecom 2.3 Fax for PC Card Modems ReadMe incorrectly states that the TDK-DF2814 model has been tested for compatibility. The Read Me file also does not give much information about the PC Cards mentioned as being tested.

DISCUSSION -----

The following is an excerpt from the Telecom Software 2.3: Fax for PC Card Modems Read Me file:

"The Apple Telecom software should be compatible with most fax class 2 compatible PC Card modems. The software has been specifically tested for compatibility with the cards listed below:

- COM1-MC217 and MC218 models.
- PNB-Danube V32bis and Danube V34 models.
- TDK-DF2814 model."

Corrections to and Clarifications for the Read Me File
=====

CORRECTION

* TDK-DF2814

TDK reports that their TDK-DF2814 PC card modem is class 1 and NOT class 2. Users have reported, when configuring Fax Terminal by selecting Select Auto Answer, quitting Fax Terminal and then re-launching it; they receive an error message that the modem is not a Class II modem.

Users can, however, use the TDK-DF2814 modem for data without problem. This has been verified with some data communications-based products.

CLARIFICATIONS

* COM1-MC217 and MC218

The MC217 and MC218 cards are made by a company called COM One. The MC217 is a 14.4 kbps data/fax PC card and the MC218 is a 28.8 kbps data/ 14.4 kbps fax PC Card. An update is available on the COM One web page for the MC218 which upgrades it to a 33.6 kbps data modem.

* PNB-Danube V32bis and Danube V34

The PNB-Danube cards were made by a company called P.N.B. in Suresnes, France. The Danube V32bis is a 14.4 kbps data/fax card and the Danube V34 is a 28.8 kbps data/ 14.4 kbps fax card.

In 1993 US Robotics acquired 100 percent of the common stock of Suresnes, France-based P.N.B. s.a., a designer and manufacturer of data communications products for IBM-compatible personal computers and workstations and a leading international supplier of products for portable computers.

For more information about these cards, you should contact US Robotics' French division, U.S. Robotics s.a., in Villeneuve d'Ascq, France.

Note: This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

Revised: 10/24/95
Security: Everyone

PowerBook 100: Use Apple HD SC Setup 7.3.2 or Later (10/95)

=====

Article Created: 24 October 1995

TOPIC -----

I am trying to reinitialize the hard drive in my PowerBook 100 using the Apple HD SC Setup utility on the original Disk Tools disk that came with my computer. Each time I try, I get an error ID=02. What is wrong?

DISCUSSION -----

This was an issue with the version of Apple HD SC Setup included with your PowerBook 100 computer. This was fixed with Apple HD SC Setup version 7.3.2 which first shipped with System 7.5. This version is available from online services.

These articles can help you locate Apple HD SC Setup:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Apple HD SC Setup: Does it Support Blind Transfers? (11/95)

Revised: 11/9/95
Security: Everyone

Apple HD SC Setup: Does it Support "Blind Transfers"? (11/95)

=====

Article Created: 20 October 1995
Article Reviewed/Updated: 9 November 1995

TOPIC -----

What are blind transfers and what are the results of having a disk formatted using them as opposed to not using them? I recently added a Daystar PowerPro 601 upgrade card to my Quadra 800 and the documentation recommended turning off blind transfers. Does Apple HD SC Setup use blind transfers?

DISCUSSION -----

Blind transfers refer to the way data is transferred to the hard drive by the driver. In drive formatting software that supports turning this option on or off, a different version of the driver is written to the driver partition.

If blind transfers are not enabled, polled transfers are used. Polled transfers are used with slow SCSI devices or SCSI devices attached to older Macintosh computers. Older, in this case, means the Macintosh SE and Macintosh Plus. In polled transfer mode, the SCSI Manager polls the SCSI controller to see if there is data to be read before reading or that the last set of data was written before sending the next set. This is the safest method for performing reads and writes.

When using blind transfers, SCSI Manager assumes the data can be written to or read from the drive as fast as SCSI Manager can read it. If a slow drive is used, there is the potential for data corruption due to timing problems. If the drive cannot write the data fast enough, data will be lost due to overflow of data buffers. If the drive cannot supply data fast enough during a read, SCSI Manager will be reading erroneous information out of the controller because the data has not arrived yet. Blind transfers can significantly improve the speed of SCSI throughput.

Apple HD SC Setup determines whether or not to install the driver which uses blind transfers based on the computer the drive is attached to when it is formatted. Apple HD SC Setup only turns off blind transfers on drives formatted

while connected to the Macintosh SE or Macintosh Plus.

Document Convertor 1.0.4: Read Me File (10/95)

Revised: 10/20/95
Security: Everyone

Document Convertor 1.0.4: Read Me File (10/95)

=====

Article Created: 20 October 1995

TOPIC -----

This article contains the ReadMe file included with the Document Convertor software version 1.0.4.

DISCUSSION -----

What is it?

=====

Macintosh Easy Open is a system extension from Apple Computer that works with MacLinkPlus/Easy Open Translators to deliver file translation as transparently as possible. Together, they allow you to open a file when you don't have the application that created it (see end of document for list of file translators included with MacLinkPlus).

The Macintosh Easy Open system extension also includes a "Document Converter." This is a mini-application that can be set up to translate files into different application formats by dragging files on top of it.

Installation

=====

Macintosh Easy Open should already be installed with your system. There are several components in Macintosh Easy Open and the Document Converter which are installed different places:

Macintosh Easy Open...Extensions folder in the System folder
Macintosh Easy Open Setup...Control Panels folder in the System folder
MacLinkPlus for Easy Open...Extensions folder in the System folder
Document Converter... MacLinkPlus folder

What does it do?

=====

Macintosh Easy Open operates behind the scenes to provide three services.

Translation Management

Macintosh Easy Open intervenes in situations when no application takes responsibility for creating a file.

When you double-click on a file that doesn't have an "owner" (the application that created that file), Macintosh Easy Open will present you with all the applications on your hard drive that can open that file, either with their own internal translation capabilities, or with the help of an external translation system, such as MacLinkPlus. You simply need to select an application from the list, then click the "Open" button. If the application was listed "with MacLinkPlus translation", MacLinkPlus will convert the file into that application's format.

Once the file is translated, the application that was selected launches and opens the file. Macintosh Easy Open stores your "choice" as a preference. The next time you double-click on another file of the same format (for example, WordPerfect PC), your preference will be highlighted in the Macintosh Easy Open dialog.

Note: The dialog box (above) appears whether you double-click on a "foreign" file, drag the file on an application or choose "File: Open".

Descriptive "Kind" Information

Macintosh Easy Open adds new, more descriptive file information to your Macintosh. Rather than seeing every file described as "document", you will see more descriptive information - regardless of the applications that reside on your Mac.

Enhanced "Open" Dialog

Macintosh Easy Open lists all files or documents you can open when you are working in an application program. It also adds larger icons to files.

Document Converter

=====

Macintosh Easy Open provides a capability through its Document Converter to drag-and-drop files onto pre-set mini-applications and have them translate automatically. This facility makes it easy to convert a file without opening it. Macintosh Easy Open must be installed for the Document Converter to work.

Each Document Converter translates to a specific format using the file translation capabilities available to your Mac. You can set up one or more Document Converters by making copies of the Document Converter provided in the MacLinkPlus folder. Once the document converter is "set", it will always translate similar file formats into its appropriate format. Duplicate a document converter each time you need to translate a file type into a new

format. Document Converters can be changed by double-clicking and re-setting them.

Note: Unlike most Macintosh applications, Document Converters behave differently when you double-click on them than they do when you drag a file onto them. Double-clicking on a Document Converter only sets the translation path. Dragging a file onto it actually activates the translation.

Control Panel Options

=====

Macintosh Easy Open has a "setup" control panel in the system folder. This control panel contains four options:

"On/Off": allows you to turn Macintosh Easy Open's file translation services on and off. This will not affect the enhanced file information available in the View menu or the ability to use the Document Converter.

"Always Show Choices": controls whether or not the Macintosh Easy Open dialog will appear. If this option is selected, the Macintosh Easy Open dialog will always appear with all available translation options. If it is deselected, Macintosh Easy Open will automatically choose the last translation option that you selected for a particular file format.

"Include Choices from Servers": extends Macintosh Easy Open's search for applications to file servers. Note: Including choices from servers can be fairly slow depending on how many server volumes are available to you and how large they are. If you want Macintosh Easy Open to limit its search for applications to disks directly connected to your Macintosh, uncheck this option (recommended in most cases).

"Delete Preferences": deletes your Macintosh Easy Open preferences.

PowerBook 190 & 5300: Norton Util Reports Wrong Speed (10/95)

Revised: 10/20/95
Security: Everyone

PowerBook 190 & 5300: Norton Util Reports Wrong Speed (10/95)

=====

Article Created: 20 October 1995

TOPIC -----

I ran Norton Utilities 3.1 and it reported that my supposedly 100Mhz Macintosh Powerbook 5300cs is running at 87MHz! What's wrong? Does my computer need service?

DISCUSSION -----

Apple has been informed by Symantec, the company that owns Norton Utilities, that the reason for the error you experienced is that they did not have the correct Gestalt call implemented in their software for this Macintosh PowerBook computer when they wrote the latest version of Norton Utilities. This is why Norton Utilities reports the wrong speed for your PowerBook 5300 computer and some other new PowerBook computers like the Powerbook 190.

A Gestalt call is implemented in many software applications by programmers to allow the application to find out if a certain feature is available on the computer on which it is running. In your case, Norton Utilities was checking the processor speed, but did not send the correct Gestalt call to get the right answer. So, for example, if a programmer is writing a program that requires a Floating Point Unit (FPU) they can do a Gestalt call at the beginning of their program and the computer will tell them whether it has one or not. That way they can tell the user sorry you have no FPU this program requires one, instead of making a direct call to the which would generate an error since the machine does not have one.

MAE 2.0 and MS Office Floppy Disk Install Issue (10/95)

Revised: 10/23/95
Security: Everyone

MAE 2.0 and MS Office Floppy Disk Install Issue (10/95)

Article Created: 23 October 1995

TOPIC -----

I'm having problems installing Microsoft (MS) Office on my SCARCStation with MAE 2.0 and Solaris 2.4. The installation generally fails towards the end of the installation process. Is there a known issue when using the Microsoft 1.6 MB floppy disk format?

DISCUSSION -----

Yes, there can be an issue with a Microsoft Office floppy disk installation. This issue is in an MAE Tech Note, a portion of which is below:

MAE and Microsoft Office

Microsoft has instituted a new floppy disk format (known as DMF -- Distributed Media Format) that permits distribution of software on a smaller number of floppy disks. This is accomplished by using a format of 1.6 MB which cannot be read by current PC-compatible (360 KB/720 KB/1.4 MB) or Apple (400 KB/800 KB/1.4 MB) floppy drives and requires the installer program to read the floppies. The special installer modifies the hardware floppy driver to support this new format.

To properly install MS Office for use with MAE, you either need a CD, or a floppy disk set that does not use DMF. When running the install, select a new folder when asked, to specify the directory for installation. The directory created will then be the installation folder, and the install will proceed normally.

In addition, when asked to update Excel graphs, select No.

At Ease 3.0 and ARA 2.0.1 Compatibility (10/95)

Revised: 10/23/95
Security: Everyone

At Ease 3.0 and ARA 2.0.1 Compatibility (10/95)

=====

Article Created: 23 October 1995

TOPIC -----

This article describes compatibility between Apple Remote Access (ARA) 2.0.1 and At Ease for Workgroups and Basic 3.0.

DISCUSSION -----

At Ease 3.0 and ARA 2.0.1 are compatible. ARA may be added to an At Ease Panel, used with At Ease panels, Restricted Finder, or Finder access, and used to dial out.

However, you will not be able to access the Remote Access Setup control panel from ARA's Setup menu. You will receive a message that states, "The Remote Access Setup icon cannot be opened because the Finder is unavailable. You must either locate the icon and open it manually, or launch the Finder and retry your selection."

The At Ease Administrator should pre-select the correct modem script in the Remote Access Setup control panel before adding ARA to the At Ease panel.

PlainTalk 1.4.1: No Sound Speakable Items Enabled (11/96)

Revised: 11/11/96
Security: Everyone

PlainTalk 1.4.1: No Sound Speakable Items Enabled (11/96)

=====

Article Created: 23 October 1995
Article Reviewed/Updated: 11 November 1996

TOPIC -----

I just installed PlainTalk 1.4.1 on my Macintosh Performa 6200. When I turn on Speakable Items in the Speech Control Panel, I no longer hear any sound from my computer. The speech recognition is working and executing the commands I speak, but there are no feedback sounds or system beeps playing from my speaker. It is as if my speakers are muted. I checked the Sound control panel, and it is set at full output volume to the internal speaker of the computer.

DISCUSSION -----

This issue has been resolved in PlainTalk 1.5, which is available from <http://www.speech.apple.com>. The following computers require PlainTalk 1.5 in order to properly use speech recognition:

- Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.
- Macintosh 5300CD family: Macintosh 5300/100 LC, Performa 5300.
- Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.
- Macintosh 6300CD family: Performa 6300, Performa 6290

Article Change History:

11 Nov 1996 - Added 1.5 information.
24 Jul 1996 - Updated information based on info in Read Me.

PowerBook PC Cards: Card Won't Show on Desktop (10/95)

Revised: 10/23/95
Security: Everyone

PowerBook PC Cards: Card Won't Show on Desktop (10/95)

=====

Article Created: 23 October 1995

TOPIC -----

I recently purchased a Global Village PowerPort Platinum PC Card for my PowerBook 5300 computer. It has been working fine for several days, but now it does not show on my desktop when I insert it. I can still use it for fax or data communication as if it is there.

DISCUSSION -----

The PC Card Extension must be loaded at startup in order for your PC Card to appear on the desktop. You can still use your PC Card even though it does not appear on the desktop but you will have to use the eject button next to the PC slot to eject the card.

Verify that the PC Card extension is in the Extensions folder of your System Folder and that it has not been disabled in the Extensions Manager control panel. Restart your PowerBook. Your card should appear when the computer completes its startup sequence.

Open Transport: MegaPhone & Other Apps Activate AppleTalk (3/96)

Revised: 3/22/96
Security: Everyone

Open Transport: MegaPhone & Other Apps Activate AppleTalk (3/96)

Article Created: 23 October 1995
Article Reviewed/Updated: 22 March 1996

TOPIC -----

I have a Power Macintosh 7500/100 with a GeoPort Telecom Adapter, and I'm using Telecom 2.1 software. The GeoPort Telecom Adapter is connected to the computer's modem port.

After doing a clean install of the system software and installing the Apple Telecom 2.1 software, while troubleshooting, I was able to use the MegaPhone demo software version 1.0.2ST successfully. I then installed the released MegaPhone software, version 1.0.2, selected the modem port in the AppleTalk control panel, and made AppleTalk inactive.

When launching MegaPhone, AppleTalk automatically becomes active, and I'm unable to use the MegaPhone software. What is wrong?

DISCUSSION -----

Issue

Cypress Research has reported, when launching the released version of the MegaPhone application, it checks to see if AppleTalk is active or inactive. When this check is made, AppleTalk automatically becomes active.

This issue has also been noticed with some other applications which make the same system check and automatically activate AppleTalk such as some versions of the following: Adobe Pagemaker, Macromedia Freehand, Quark XPress, Global Village Fax Software, and others.

MegaPhone Workaround

If a user calls Cypress with this issue, Cypress will send them a modified version of MegaPhone which does not check AppleTalk for being active or inactive.

Resolution

Open Transport version 1.1, installed with System 7.5 Update 2.0 corrects this issue.

PowerBook & Power Mac: RAM Doubler Compatibility Issue (2/96)

Revised: 2/15/96
Security: Everyone

PowerBook & Power Mac: RAM Doubler Compatibility Issue (2/96)

Article Created: 24 October 1995
Article Reviewed/Updated: 15 February 1996

TOPIC -----

My new PowerBook 5300 computer has been freezing at startup since I installed the latest version of RAM Doubler.

DISCUSSION -----

Issue
=====

Connectix Corporation, the maker of RAM Doubler, acknowledges that there is a compatibility issue with version 1.5.2 of their RAM Doubler application with some PowerBook computers.

The compatibility issue mentioned here affects the Macintosh PowerBook 2300, 5300, 5300c, 5300cs and 5300ce series computers and Power Macintosh 7200, 7500, 8500, and 9500 computers.

This issue does not affect any other desktop Macintosh computers, any earlier model PowerBook computers, or the PowerBook 190 and 190cs series computers. Other Connectix programs, such as Speed Doubler and Maxima, have no compatibility issues with the Macintosh PowerBook computers mentioned here.

Resolution
=====

According to Connectix, RAM Doubler version 1.6.1 and Speed Doubler version 1.1 are both fully compatible with the Macintosh PowerBook 5300 series computers. If a customer is not up to date, they can download a current updater from the Connectix web site (www.connectix.com) or from any online service.

The issue with these desktop Power Macintosh computers can be resolved by

installing RAM Doubler 1.5.3 or later (available from Connectix).

Workaround

=====

If you have RAM Doubler version 1.5.2 and you cannot immediately get version 1.6.1, you should remove RAM Doubler from your operating system.

Step 1

To remove RAM Doubler startup your computer with the extensions off by pressing on and holding down the shift key and the tilde (~) key during startup.

Note: You need to hold down both keys because the shift key alone will not disable RAM Doubler.

Step 2

Insert the RAM Doubler disk and use the Installer to de-install the application.

ARA MultiPort Server & Global Village Platinum Modem (10/95)

Revised: 10/24/95
Security: Everyone

ARA MultiPort Server & Global Village Platinum Modem (10/95)

=====

Article Created: 24 October 1995

TOPIC -----

I have an Apple Remote Access (ARA) MultiPort Server, and I just purchased a Global Village TelePort Platinum modem to use with the server. This modem has a permanently attached cable with a DIN-8 connector for a Macintosh computer's serial port, however, this pre-attached modem cable will not attach to the ARA Serial Card and RS-232 Cable's DB-25 connectors. I have searched for an adapter that will connect the DB-25 plug to the DIN-8 plug (a DB-25 socket to DIN-8 socket adapter), and despite being told that any electronics store should have one, I have found none. Do you know of such an adapter?

DISCUSSION -----

Essentially, the TelePort Platinum modem will not work with an ARA Serial Card and RS-232 Cable, as you have discovered. The cable supplies four RS-232 Ports using DB-25 plug connectors. The modem has a captive cable which ends in a DIN-8 plug connector.

A socket DIN-8 "in" cable mounting configuration is rare in the United States. The company that imports this connector into the United States, HB Associates at 510-487-3933, reports that no major United States companies purchase the plug cable connector. They can order one for you from one of the DIN-8 component manufacturers.

However, you will still have to determine the pinouts of the adapter cable, and wire the adaptor yourself, which is not recommended unless you are familiar with this process.

Apple's recommendation is to reconsider using the TelePort Platinum modem with the ARA Serial Card and RS-232 Cable. If you need multiple port access, you should find another modem that either supports DB-25 connectors, or does not use a captive cable with a DIN-8 connector. If you must use the TelePort Platinum modem, you may be able to use the modem port in the Macintosh computer, or try another multiple port card or cable.

PCI Cards Maximum Size (2/97)

Revised: 2/24/97
Security: Everyone

PCI Cards Maximum Size (2/97)

Article Created: 24 October 1995
Article Reviewed/Updated: 24 February 1997

TOPIC -----

I'm looking for the maximum size, length by height, of PCI cards used in the PCI-based Power Macintosh computers.

DISCUSSION -----

The Power Macintosh computers, such as the 7200, 7300, 7500, 7600, 8500, 8600, 9500 and 9600 support two different sizes of PCI cards in any of the PCI slots: 7-inch x 4-inch, and 12-inch x 4-inch.

The Power Macintosh 4400 has two PCI expansion slots, and one slot accepts only 7-inch PCI cards, but the other slot accepts either 7- or 12-inch cards.

Finally, the Power Macintosh 5400, 5500, 6400, 6500 and Macintosh Performa 6400 series, and Macintosh Performa 6360/160 computers support only 7-inch PCI cards.

The PCI local bus Specification 2.0 list the exact dimensions as:

Begin_Table

In Inches	6.875 x 4.2	and	12.283 x 4.2
In Millimeters	174.630 x 106.68	and	312 x 106.68

End_Table

Article Change History:

24 Feb 1997 - Added additional computers.
20 Nov 1996 - Removed one computer model which was listed in error.
15 Nov 1996 - Added 6360.

Apple LAN Utility 1.0b4e1: ReadMe File (10/95)

Revised: 10/24/95
Security: Everyone

Apple LAN Utility 1.0b4e1: ReadMe File (10/95)

=====

Article Created: 24 October 1995

TOPIC -----

This article contains the Read Me file included with the Apple LAN Utility 1.0b4e1 posted online. This update adds support for the PCI-based Power Macintosh 7200, 7500 and 8500 computers.

DISCUSSION -----

Apple LAN Utility version 1.0b4e1

The Apple LAN Utility is provided to perform the following tasks for Apple LAN interfaces:

- 1) Obtain the burned-in address without connecting to a network.
- 2) Override the burned-in address with a locally-administered address (this is mostly done in SNA and DECnet environments).
- 3) Set the speed for token ring interfaces that are software selectable.

The utility is intended to handle all Apple ethernet and token ring interfaces, whether built-in or on cards. When run, the utility opens one window per interface present in the machine, describing what its configuration will be the next time that interface is activated. This utility makes no attempt to alter the current operation of an active interface.

To make any changes to an interface, it is necessary to choose "Allow Changes" from the Edit menu. This was provided to minimize the chance of accidentally overriding a burned-in address.

To remove a locally-administered address, either clear the entry or set it to 12 zeroes.

The utility can save a tab-delimited text file describing the machine's configuration. The file has the following format:

..TIL18809-Apple_LAN_Utility_1-0b4e1-ReadMe_File_10-95_(TA34610).pdf

Line 1: The Macintosh model, machine name and user name
Line 2: Title strings
Lines 3 - n: One line per interface with bus/slot, interface name, burned-in address, local address and speed

The addresses are given in hexadecimal and are quoted to allow the file to be imported into a spreadsheet if desired.

Although the text file is rather ugly when viewed in TeachText/SimpleText, it can be made to look better when viewed in a word processor or spreadsheet program by adjusting the tabs or cell sizes appropriately.

This utility is provided free of charge on an "as is" basis. This is not an official product of Apple Computer!

Disclaimer of Warranty on Software. This software program and related documentation are provided "AS IS" and without warranty of any kind, and APPLE EXPRESSLY DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE. APPLE DOES NOT WARRANT THAT THE FUNCTIONS CONTAINED IN THIS SOFTWARE PROGRAM WILL MEET YOUR REQUIREMENTS, OR THAT THE OPERATION OF THIS SOFTWARE PROGRAM WILL BE UNINTERRUPTED OR ERROR-FREE, OR THAT DEFECTS IN THIS SOFTWARE PROGRAM WILL BE CORRECTED. FURTHERMORE, APPLE DOES NOT WARRANT OR MAKE ANY REPRESENTATIONS REGARDING THE USE OR RESULTS OF THE USE OF THE SOFTWARE OR RELATED DOCUMENTATION IN TERMS OF THEIR CORRECTNESS, ACCURACY, RELIABILITY, OR OTHERWISE. NO ORAL OR WRITTEN INFORMATION OR ADVICE GIVEN BY APPLE OR ANY APPLE REPRESENTATIVE SHALL CREATE A WARRANTY OR IN ANY WAY INCREASE THE SCOPE OF THIS WARRANTY. SHOULD THIS SOFTWARE PROGRAM PROVE DEFECTIVE YOU, AND NOT APPLE, ASSUME THE ENTIRE COST OF ALL NECESSARY REPAIR OR CORRECTION. SOME STATES DO NOT ALLOW THE EXCLUSION OF IMPLIED WARRANTIES, SO THE ABOVE EXCLUSIONS MAY NOT APPLY TO YOU.

Limitation of Liability. UNDER NO CIRCUMSTANCES INCLUDING NEGLIGENCE, SHALL APPLE BE LIABLE FOR ANY INCIDENTAL, SPECIAL OR CONSEQUENTIAL DAMAGES THAT RESULT FROM THE USE OR INABILITY TO USE THIS SOFTWARE PROGRAM OR RELATED DOCUMENTATION, EVEN IF APPLE OR AN APPLE REPRESENTATIVE HAS BEEN ADVISED OF THE POSSIBILITIES OF SUCH DAMAGES. SOME STATES DO NOT ALLOW THE LIMITATION OR EXCLUSION OF LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR EXCLUSION MAY NOT APPLY TO YOU.

Release Notes

Version 1.0b4 includes the following changes:

Support was added for newer PCI-based Power Macintoshes - the 7200, 7500 and 8500.

Version 1.0b3 includes the following changes:

Support was added for the Power Macintosh 9500.

QuickDraw 3D Accelerator Card: Specifications (10/96)

Revised: 10/22/96
Security: Everyone

QuickDraw 3D Accelerator Card: Specifications (10/96)

Article Created: 24 October 1995
Article Reviewed/Updated: 22 October 1996

TOPIC -----

This article provides the specifications of the QuickDraw 3D Accelerator Card for Power Macintosh computers with PCI slots.

DISCUSSION -----

Memory

- 128K SRAM cache
- 512K of high-speed SRAM texture memory, for up to 12 texture maps
- Does not include frame buffer ASICs
- Includes two custom ASICs. Rendering engine is based on state-of-the-art 0.5µ technology

Acceleration capabilities

- Accelerates QuickDraw 3D rendering to speeds as high as 12 times faster
- Renders 10 million trilinearly filtered, mipmapped texture pixels per second
- Renders up to 120,000 triangles per second
- Accelerates Gouraud shading, texture mapping, transparency, and Constructive Solid Geometry (CSG)
- Continually enables trilinear filtering, and mipmapping diffuse and specular lighting producing very high quality texture mapped images
- Uses high-performance SRAM memory to display up to 12 texture maps in each open window
- Outputs an alpha channel, making it fast and easy to transfer images between applications
- Offers hardware-accelerated per-pixel Z sorting for precise rendering of transparent surfaces or CSG, regardless of submission order or interpenetration
- A single card accelerates 3D rendering to all frame buffers in the system. This means it accelerates rendering on multiple monitors.

Environmental requirements

- Operating temperature: 50° to 104° F (10° to 40° C)
- Humidity: 20% to 95% noncondensing

Standards compliance/agency approvals

- PCI 2.1 compliant, IEEE 802.5 and 802.2

System requirements

- An Apple Power Macintosh computer with PCI slots or another PCI-equipped computer running the Mac OS
- Macintosh system software version 7.5.2 or later; System Enabler 1.1 or later
- At least 16 MB of RAM
- A hard disk drive
- A CD-ROM drive for installing software

Software and demos included on CD-ROM

- QuickDraw 3D 1.03 Installer and Demo Files - The installer will be localized in the following languages: English, French, German, Spanish, Italian, Japanese, Dutch, and Swedish.
- Apple QD3D HW Driver
- Apple QD3D HW Plug-In (Driver)
- ReadMe file
- Demos folder - In the Demos folder are the following third party and Apple-developed demos:
 - TextureEyes, a live-video mapping 3D application with models and movies
 - MoviePlayer 2.1
 - Havoc, a 3D game demo from Reality Bytes
 - Models, textures, and product catalog from Specular International
 - Models from ViewPoint Datalabs

Article Change History:

- 22 Oct 1996 - Added keyword and reformatted.
- 27 Oct 1995 - Changed distribution status.

QuickDraw 3D Accelerator Card: Read Me File (11/96)

Revised: 11/21/96
Security: Everyone

QuickDraw 3D Accelerator Card: Read Me File (11/96)

Article Created: 24 October 1995
Article Reviewed/Updated: 21 November 1996

TOPIC -----

This article contains the ReadMe file installed with the QuickDraw 3D Accelerator Card.

DISCUSSION -----

Important Information About QuickDraw 3D

QuickDraw 3D enables your Macintosh computer to display three-dimensional graphics, using applications designed to take advantage of QuickDraw 3D. It also provides a common file format, called 3DMF (for "3D metafile"), for exchanging 3D documents and acceleration services which support plug-and-play accelerator cards.

The following are required to install and run QuickDraw 3D and the QuickDraw Accelerator Card:

- A PowerPC based computer equipped with a PCI slot (such as a Power Macintosh 7200, 7500, 8500, or 9500)
- 16 megabytes of random access memory (RAM)
- Macintosh system software version 7.5.2, with System Enabler 1.1, or later
- A system that can display thousands or millions of colors

The QuickDraw 3D Accelerator Card

The QuickDraw 3D Accelerator Card brings workstation-class 3D acceleration to any Power Macintosh or Macintosh Performa computer with a PCI (Peripheral Component Interconnect) slot. Its accelerated 3D rendering allows you to create or work with 3D objects and scenes quickly and efficiently.

Featuring a compact (6.88-inch) design, the QuickDraw 3D Accelerator Card provides exceptional performance. It plugs easily into the PCI slot of your

Power Macintosh (or other PCI-equipped computer running Macintosh system software version 7.5.2 or later), to let you design 3D scenes and shade and texture objects faster than ever before. You can interact smoothly with 3D models that cover the full screen, even when performing Constructive Solid Geometry (CSG) or when positioning texture maps. And you'll find that the motion in your 3D animations flows smoothly and looks natural.

To accomplish this workstation-class performance, the QuickDraw 3D Accelerator Card works in conjunction with QuickDraw 3D, a cross-platform application program interface (API) that is an emerging standard in the area of computer-based 3D graphics and animations. By itself, QuickDraw 3D was designed to take advantage of PowerPC RISC technology to provide real-time, interactive rendering for simple models. The QuickDraw 3D Accelerator Card enhances this capability, enabling you to use your Macintosh computer to work in real time with much larger and more complicated models.

With complex 3D models rapidly becoming the standard in computer-based graphics, high-speed 3D rendering capabilities are increasingly a necessity for many computer users. So whether you're an architect, a graphic artist, a multimedia developer, a scientist who works with visualization, or simply a 3D game enthusiast, the QuickDraw 3D Accelerator Card will make your interactions with on-screen images significantly faster, better—and more satisfying.

Using QuickDraw 3D

The QuickDraw 3D folder includes the following applications, 3D models, and textures that allow you to explore the 3D capabilities of your Macintosh:

- SimpleText version 1.3.1 and Scrapbook version 7.5.1. These applications allow you to open and interact with 3DMF models.
- A game called "Gerbils!" so you can experience the fun side of 3D graphics.
- Cumulus, a multimedia database provided by Canto Software.
- A new Scrapbook File with sample 3DMF models.
- A number of 3DMF models provided by Model Masters and Viewpoint Datalabs International.
- Textures provided by Wraptures and Xaos Tools.

You can expect more applications using QuickDraw 3D in the near future, including new versions of application programs you may already own. Contact your software vendors for more information about their plans to support this new technology.

QuickDraw 3D and Image Quality

QuickDraw 3D has been optimized to display three-dimensional graphics of high quality. To display high-quality images, and obtain the best performance from your system, we recommend that you set your system to display thousands or millions of colors.

The QuickDraw 3D Accelerator Card only accelerates rendering to screens which display thousands or millions of colors. QuickDraw 3D will run if you choose another display format, but rendering will not be accelerated.

Features of Your QuickDraw 3D Accelerator Card

=====

Workstation-class 3D acceleration

- Accelerates QuickDraw 3D rendering up to 12 times (12X)
- Renders 10 million tri-linearly filtered, bitmapped texture pixels/second
- Renders up to 120 thousand triangles per second
- Accelerates Gouraud shading, texture mapping, transparency, and Constructive Solid Geometry (CSG)
- Tri-linear filtering, mipmapping, and diffuse and specular lighting are always enabled, producing very high-quality texture-mapped images
- Uses high-performance SRAM memory to display up to 12 texture maps in each window
- Outputs an alpha channel, making it fast and easy to transfer images between applications
- Hardware-accelerated per-pixel Z-sorting provides precise rendering of transparent surfaces or CSG, regardless of submission order or interpenetration

Scalability

- A single card accelerates 3D rendering to all frame buffers in the system.
- Hardware rendering performance can be doubled simply by installing a second card.

Troubleshooting 3D Acceleration

=====

If 3D rendering does not appear to be accelerated, check the following:

- Check that your system is set to display thousands or millions of colors. These are the only display modes in which acceleration can occur.
- Check that your application uses QuickDraw 3D. Some older 3D applications don't use QuickDraw 3D for rendering, and can not be accelerated.
- Some applications allow you to switch hardware acceleration on or off. Check your application's documentation to be sure that hardware acceleration is enabled (on).
- Check that the following files are in the Extensions Folder, inside the System Folder:

Apple QD3D HW Driver
Apple QD3D HW Plug-In

- The performance advantage of any 3D accelerator varies depending on the type of scene being rendered. You may find that some applications show the benefits of acceleration more than others. If you want to verify that acceleration is working, try the Gerbils! application (included on your installer CD-ROM) – it runs much faster when the QuickDraw 3D Accelerator Card is installed.

Turning Off 3D Acceleration

If you need to turn off the QuickDraw 3D Accelerator Card (for example, to compare accelerated performance with software-only rendering), follow these steps:

Step 1

Quit all applications that use QuickDraw 3D.

Step 2

Create an empty folder on the desktop.

Step 3

Move the file named "Apple QD3D HW Plug-In" from the Extensions Folder (inside the System Folder) into the empty folder. The accelerator card is now disabled.

Step 4

Restart QuickDraw 3D applications.

To turn the QuickDraw 3D Accelerator Card back on, follow these steps:

Step 1

Quit all applications that use QuickDraw 3D.

Step 2

Move the file named "Apple QD3D HW Plug-In" back into the Extensions Folder.

Step 3

Restart QuickDraw 3D applications.

General Troubleshooting

For better performance, we recommend that Virtual Memory be turned off. If your system has only 16 megabytes of RAM, leaving Virtual Memory enabled can cause unexpected crashes. For 16-megabyte systems, make sure to turn Virtual Memory off before starting any application that uses QuickDraw 3D.

If you try to start an application that uses QuickDraw 3D and get the message "The application '<application name>' could not be launched because QuickDraw 3D could not be found," make sure that the following files are in the Extensions Folder, inside the System Folder:

- QuickDraw 3D
- QuickDraw 3D Accelerator
- QuickDraw 3D Viewer

If the files are there and you still get the message, it means that you don't have enough memory to run the application. You may be able to open the application if you try one or more of the following:

- Quit other open applications.
- Reduce the amount of memory allocated to the application. Take these steps to reduce it:
 1. Select the application's icon in the Finder.
 2. Choose Get Info from the File menu.
 3. Type a lower number in the boxes for Minimum Size and Preferred Size.
- Install more memory (RAM.)

If you would like to use the Scrapbook File supplied in the QuickDraw 3D folder instead of your existing Scrapbook File, you must copy the Scrapbook File from the QuickDraw 3D Folder to the System Folder on your Macintosh. Note that this will replace your existing Scrapbook File in the System Folder, thus erasing any previously stored contents.

How QuickDraw 3D Uses Memory =====

QuickDraw 3D is a shared library. When no applications that rely on QuickDraw 3D are open, the library does not take up random access memory (RAM) space. Once a QuickDraw 3D-based application is open, the amount of memory taken up by the shared library doesn't increase if other QuickDraw 3D-based applications are launched. Of course, each application will take up memory according to their size and the complexity of the files being used. The memory taken up by QuickDraw 3D becomes available when you quit all QuickDraw 3D-based applications.

While a QuickDraw 3D application is open, the QuickDraw 3D library allocates memory from "temporary memory." When you choose About This Macintosh from the Apple (🍏) menu, it is shown as memory used by the System. After you quit the application, the memory becomes available, but the size shown in the About This Macintosh window may not reflect this. The memory previously used by QuickDraw 3D is, nonetheless, available for other applications (it is released to the applications as needed).

If You Need to Reinstall QuickDraw 3D =====

If you need to reinstall QuickDraw 3D, follow these steps:

Step 1

Open the QuickDraw 3D Install folder and double-click the Installer icon.

Step 2

After installing QuickDraw 3D, restart your computer.

Step 3

If you want the items in the QuickDraw 3D Extras folder, drag the folder to the newly-created QuickDraw 3D Folder inside the Apple Extras folder.

Removing QuickDraw 3D

=====

If you wish to remove QuickDraw 3D, follow these steps:

Step 1

Insert the CD that contains the QuickDraw 3D software.

Step 2

Open the QuickDraw 3D Install folder and double-click the Installer icon.

Step 3

Choose Custom Remove from the pop-up menu.

Step 4

Click the box next to each item to put a check in it.

Step 5

Click Remove.

Step 6

Restart your computer.

QuickDraw 3D: Read Me File (10/95)

=====
Article Created: 24 October 1995
Article Reviewed/Updated: 27 October 1995

TOPIC -----

This article contains the ReadMe file installed with the QuickDraw 3D software.

DISCUSSION -----

Important Information About QuickDraw 3D

QuickDraw 3D enables your Macintosh computer to display three-dimensional graphics, using applications designed to take advantage of QuickDraw 3D. It also provides a common file format, called 3DMF (for "3D metafile"), for exchanging 3D documents and acceleration services which support plug-and-play accelerator cards.

The following are required to install and run QuickDraw 3D:

- a PowerPC based computer
- 16 Megabytes of memory (RAM)
- System 7.1.2 or later

Using QuickDraw 3D

The QuickDraw 3D folder includes the following applications, 3D models and textures that allow you to explore the 3D capabilities of your Macintosh:

- SimpleText version 1.3 and Scrapbook version 7.5.1. These applications allow you to open and interact with 3DMF models.
- A new Scrapbook File with sample 3DMF models.
- A number of 3DMF models provided by Model Masters and Viewpoint Datalabs International.

- Textures provided by Wraptures and Xaos Tools.

You can expect more applications using QuickDraw 3D in the near future, including new versions of application programs you may already own. Contact your software vendors for more information about their plans to support this new technology.

QuickDraw 3D and image quality

QuickDraw 3D has been optimized to display three-dimensional graphics of high quality. To display high-quality images, and obtain the best performance from your system, we recommend that you set your system to display thousands or millions of colors.

Troubleshooting

For better performance, we recommend that Virtual Memory be turned off. If your system has only 16 Megabytes of RAM, leaving Virtual Memory enabled can cause unexpected crashes. For 16 Megabyte systems, make sure to turn Virtual Memory off before launching any application that uses QuickDraw 3D.

If you try to start an application that uses QuickDraw 3D and get the message "The application '<application name>' could not be launched because QuickDraw 3D could not be found," make sure that the following files are in the Extensions Folder, inside the System Folder:

- QuickDraw 3D
- QuickDraw 3D Accelerator
- QuickDraw 3D Viewer

If the files are there and you still get the message, it means that you don't have enough memory to run the application. You may be able to open the application if you try the following:

- Quit other open applications.
- Reduce the amount of memory allocated to the application. This is done by:
 - selecting the application's icon in the Finder
 - choosing "Get Info..." from the File menu
 - typing a lower number in the boxes for Minimum Size and Preferred Size
- Install more memory (RAM.)

If you are using a localized system, and you install this U.S. software, you will need to copy the "Scrapbook File" in the "QuickDraw 3D Folder" to the System Folder on your Macintosh. Otherwise, when you select the Scrapbook from the  menu, you will get an empty scrapbook. Note that this operation will replace any existing Scrapbook File in the System Folder, thus erasing any previously stored contents.

How QuickDraw 3D uses memory

QuickDraw 3D is a shared library. When no applications that rely on QuickDraw 3D are open, the library does not take up memory space (RAM). Once a QuickDraw 3D-based application is open, the amount of memory taken up by the shared

library doesn't increase if other QuickDraw 3D-based applications are launched. Of course, each application will take up memory according to their size and the complexity of the files being used. The memory taken up by QuickDraw 3D becomes available when you quit all QuickDraw 3D-based applications.

While a QuickDraw 3D application is open, the QuickDraw 3D library allocates memory from "temporary memory." This memory shows up in the "About This Macintosh..." window as memory used by the System. When you quit the application, the memory becomes available, but the size shown in the "About This Macintosh..." window may not reflect this. The memory previously used by QuickDraw 3D is, nonetheless, available for other applications (it is released to the applications as needed.)

If You Need to Reinstall QuickDraw 3D

If you need to reinstall QuickDraw 3D, follow these steps:

Step 1

Open the "QuickDraw 3D Install" folder and double-click the Installer icon.

Step 2

After installing QuickDraw 3D, restart your computer.

Step 3

If you want the items in the "QuickDraw 3D Extras" folder, drag the folder to the newly-created "QuickDraw 3D Folder" inside the "Apple Extras" folder.

Removing QuickDraw 3D

If you wish to remove QuickDraw 3D, follow these steps:

Step 1

Insert the CD that contains the QuickDraw 3D software.

Step 2

Open the "QuickDraw 3D Install" folder and double-click the Installer icon.

Step 3

Choose Custom Remove from the pop-up menu.

Step 4

Click the box next to each item to put a check in it.

Step 5

Click Remove.

Step 6

Restart your computer.

Apple MessagePad 120: W/ Newton 2.0 OS Description (4/97)

Article Created: 24 October 1995
Article Reviewed/Updated: 1 May 1997

TOPIC -----

This article provides the product description of the Apple MessagePad 120 with the Newton 2.0 installed.

DISCUSSION -----

The MessagePad 120 with Newton 2.0 OS

The MessagePad 120 personal digital assistant (PDA) makes your information as mobile as you are.

It allows you to organize your work and personal life; to integrate information with your personal computer; to communicate using faxes, pages, and e-mail; and to expand your capabilities with third-party solutions.

It has a built-in Notepad, to-do list, datebook, telephone log, and address file for organizing personal and business affairs, as well as Pocket Quicken to help organize personal and business expenses.

You can enter information in many ways: as digital ink, printed text, hand-drawn graphics, or with an on-screen keyboard. There's even an optional external keyboard.

Pen-based navigation and data entry make finding information easy and fast.

Its improved recognition software transforms your handwriting into typed text. You can also print your information as it appears on its easy-to-read screen, or as fully formatted pages.

The MessagePad 120 can receive wireless messages and alphanumeric pages, and can send and receive faxes and electronic mail.

The MessagePad 120 also lets you share and exchange information with either Windows software-based or Macintosh computers using the included Newton Backup Utility, or optional Newton Connection Utilities and Newton Press software.

Your MessagePad 120 can also be customized with software applications as well as accessories and on-line services that put critical information at your fingertips, no matter where you are.

Built-in organization

- Helps you plan monthly, weekly, and daily activities using the calendar and manage priorities using the Notepad
- Allows free-form notes, outlines, lists, and phone logs
- Includes customizable name and address files for colleagues and friends using a familiar business-card format
- Offers an assortment of information and productivity tools such as time-zone maps, a calculator, and currency exchange
- Includes Pocket Quicken, which puts current information about your cash, checking, savings, and credit-card accounts at your fingertips

Built-in communications

- Actively assists you in making phone calls, faxing, printing, finding information, and sending electronic mail
- Lets you beam notes, messages, schedules, or business cards via built-in infrared communications
- Uses an optional wired or wireless modem to send and receive faxes.
- Prints formatted letters and notes using Apple printers or serial or parallel printers using the optional Print Pack

Built-in integration with your personal computer

- Backs up all data onto your personal computer and can install software into your MessagePad 120 via the included Newton Backup Utility
- Using the optional Newton Connection Utilities, lets you integrate your Windows software-based or Macintosh computers to back up and synchronize information
- Using the optional Newton Press software, lets you publish electronic documents such as travel itineraries, reference books, or sales charts on your personal computer for viewing and

annotating on your MessagePad

Expandability

- Works with a large selection of PC cards and serial peripherals such as modems, pagers, wireless communications and storage products, and a keyboard
- Offers a large selection of productivity, finance, time, billing, management, reference, electronic document publishing, and entertainment software

Newton operating system upgrade

=====

For a limited time only, your MessagePad 120 with Newton 1.x operating system can be upgraded to the Newton 2.0 operating system. To order the upgrade or receive more information on the upgrade program, call 1-800-SOS-APPL, or via the Internet <http://www.info.apple.com/newton>

Product specifications are subject to change. Check with your authorized Apple reseller for the most current information about product specifications and configurations.

Apple MessagePad: List of Accessories Available (4/96)

Article Created: 24 October 1995
Article Reviewed/Updated: 11 April 1996

TOPIC -----

This article describes the accessories available for the Apple MessagePad 120. Some accessories are only available with the Newton 2.0 OS. Accessories Requiring Newton 2.0 OS are marked as such.

DISCUSSION -----

MessagePad Accessories
=====

Now you can make your Apple MessagePad personal digital assistant (PDA) even more valuable, and make it work even more efficiently.

Because no matter which MessagePad product you have, you can choose from a broad range of accessory products -- from connectivity solutions to battery enhancements to storage options.

With these optional accessories, you can print letters, send and receive faxes, receive wireless messages and pages, connect to your personal computer, or gain access to information on your network. You can also work for hours without having to change batteries. And you can protect your MessagePad -- and its accessories -- in a leather carrying case, wherever you go.

Accessories
=====

Newton Connection Kits

These kits connect your Apple MessagePad or other Newton technology-based products to a Windows PC or an Apple Macintosh computer to create, view, edit, synchronize, and back up information. They also enable you to move Newton software from your personal computer to your Newton device.

Newton Connection Utilities

This software allows your MessagePad 120 with Newton 2.0 operating system to connect to your Windows-based or Macintosh computer to create, view, edit, synchronize, and back up information with popular personal computer applications, and to gain access to your personal computer's information while at your desk or from a remote location.

Newton Press

This program allows you to publish electronic documents such as travel itineraries, reference books, or sales charts on your personal computer for viewing and annotating on your MessagePad.

Newton Keyboard

Now you can enter information into your MessagePad 120 as fast as you can type. The touchtype comfortable keyboard is lightweight and portable and comes with an attractive carrying case, so you can take it wherever you take your MessagePad. It comes in several international versions.

Power Adapter

The Power Adapter lets you run your MessagePad or Fax Modem using AC power and rechargeable battery pack for the MessagePad 110 and 120. It comes in several versions to meet international power requirements.

Rechargeable Battery Packs

These rechargeable nickel-cadmium battery packs can be one of the most effective ways to keep your MessagePad running.

Battery Booster Pack

Plug this portable pack's cable into your MessagePad and its eight AA alkaline batteries add hours of running time. Batteries are not included.

MessagePad Charging Station

Plug your MessagePad 110 or 120 into this charging station to run it on AC power while recharging its batteries. You can simultaneously quick-charge its external battery pack in two to three hours.

Battery Pack Recharger

This recharger quickly recharges battery packs for your MessagePad or MessagePad 100. One rechargeable nickel-cadmium battery pack is included.

Print Pack

The Print Pack allows you to use your parallel printer with your MessagePad. It works with most popular laser, dot-matrix, portable ink-jet, and thermal

printers, as well as printers compatible with MS-DOS and Windows-based computers.

2 MB and 4 MB Flash Storage Cards

Use the 2 MB or 4 MB Storage Card to increase the storage capacity of your MessagePad, to back up your information, and to run more applications.
Carrying Case This case protects your MessagePad 110 or 120 and your add-in PC cards when you take them on the road. It's made of durable black synthetic leather and stays securely closed.

Leather Carrying Case

The leather carrying case has room for add-in PC cards and lots of business cards, and has a zipper to keep everything where it belongs.

Communications System Carrying Case

Use this synthetic-leather carrying case to hold your MessagePad or MessagePad 100 and accessories—from the Fax Modem to storage cards.

MessagePad Telescoping Pen

This pen is designed to fit perfectly in your MessagePad 110 or 120.

Product Name	Technical Specifications	MessagePad Model

Apple MessagePad 120: W/ Newton 2.0 OS Specifications (4/97)

Article Created: 24 October 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides the technical specifications of the Apple MessagePad 120 with the Newton 2.0 OS installed.

DISCUSSION -----

Technical Specifications
=====

Newton Intelligence

- Newton Recognition Architecture
 - Recognizes handwriting—printed, cursive, or a mixture of the two—with the assistance of a 93,000- word, built-in word list
 - Lets you add up to 1,000 words to its word list
 - Includes four pop-up keyboards: typewriter, numeric, phone, and time/date
 - Recognizes graphics and symmetrical objects
- Newton Information Architecture
 - Object-oriented database stores, finds, and links information and provides a flexible view of this data
 - Newton Toolkit lets you easily create custom applications using its flexible graphical toolbox
 - Architecture lets you easily share data across applications
- Newton Communications Architecture
 - Built-in support for serial communications, PC card modems, fax send and receive, and electronic mail
 - Provides single interface for modular, object-oriented communication services
 - Supports new communications capabilities through its modular

design

- Intelligent Assistance Architecture
 - Helps users complete repetitive tasks in multiple categories, including communications, scheduling, finding, and reminding functions
 - Contains smart defaults to reduce complexity
 - Works in and between applications
 - Supports third-party extensions
- Newton Hardware Architecture
 - ARM 610 RISC processor at 20 MHz
 - Apple custom system ASIC
 - Low-power, reflective LCD display (320x240 pixels) 3.8x2.8 in. (9.6x7.2 cm)
 - Telescoping pen and crisp, transparent tablet
 - 8 MB of ROM –687K of system RAM; 1,361K of nonvolatile user RAM
 - One PC Card Type II slot with 325 mA capacity
 - LocalTalk and RS-232-compatible serial port
 - Low-power, half-duplex, infrared transceiver works at up to 38.4 kbits/sec within 3.28 feet (1 meter)
 - Protective removable lid

Communications capabilities

- Print using a variety of serial, parallel, and network printers
- Receive and store wireless messages using optional messaging cards*
- Communicate via e-mail or tap into on-line information services with an optional wired or wireless modem card and software
- Fax with optional fax/modem (automatic cover-page generation, post-formatting)
- Beam notes, name cards, and appointments at up to 38.4 kbits/sec within 3.28 feet (1 meter) using high-speed infrared technology
- Automatically dial phone calls with assistance for intelligent auto-dialing (DTMF or modem dialing)*
- Exchange electronic mail with users of on-line services including the Internet

* Note:

This service may not be available in all countries.

Size and weight

- Length: 8.0 in. (20.32 cm)
- Width: 4.0 in. (10.16 cm)

- Height: 1.2 in. (2.9 cm)
- Weight: 1.0 lb. (0.48 kg) without batteries

Operating environment

- Temperature: 32 to 104 deg. F (0 to 40 deg. C)
- Storage temperature: -4 to 117 deg. F (-20 to 47 deg. C)
- Transit temperature: -4 to 149 deg. F (-20 to 65 deg. C) for up to 72 hours
- Relative humidity: 20% to 90% noncondensing

Power requirements

- Power adapter
 - Universal, 100 to 240 volts AC, 50/60 Hz
 - Four plug configurations: U.S., U.K., Europe, and Australia
- Battery type: alkaline or NiCd Battery Pack
- Lithium cell: DL2032 –Operating range: 3 volts (nominal)
- Built-in fast charger for optional NiCd Battery Pack
- Power source: four AA batteries (included), optional Power Adapter, and optional Rechargeable NiCd Battery Pack

Computer connectivity hardware requirements

- Works with PC-compatible computers with 80386DX or later processors running Windows version 3.0 or later
- Works with Macintosh computers with 68030 or later processors and system software version 7.1 or later

Printer support

- Built-in support for the Apple LaserWriter, Apple Color LaserWriter, Apple StyleWriter, and Apple Color StyleWriter printers series (does not support the Apple Color StyleWriter Pro)
- Works with most popular PC printers, including the Hewlett-Packard LaserJet II, DeskJet 500, Canon BubbleJet 10e, and Epson LQ and FX using the optional Print Pack

Fax machine support

- Supports Group 3 fax machines

Ordering Information

MessagePad 120/2MB

Order No. H0153LL/A

- MessagePad 120 personal digital assistant with Newton 2.0 operating system
- Telescoping pen
- Batteries
- Pocket Quicken software
- Newton Backup Utility and cables
- Complete setup, learning, and reference documentation
- Limited warranty

Accessories

- The MessagePad 120 with Newton 2.0 operating system is compatible with most accessories available for the MessagePad 110 and MessagePad 120 with Newton 1.x operating system.

Please see the MessagePad Accessories data sheet for detailed information.

Newton operating system upgrade

For a limited time only, your MessagePad 120 with Newton 1.x operating system can be upgraded to the Newton 2.0 operating system. To order the upgrade or receive more information on the upgrade program, call 1-800-SOS-APPL, or through the Internet <http://www.info.apple.com/newton>

Product specifications are subject to change. Check with your authorized Apple reseller for the most current information about product specifications and configurations.

LaserWriter Pro 810: Configuring TCP/IP Printing (3/96)

Revised: 3/4/96
Security: Everyone

LaserWriter Pro 810: Configuring TCP/IP Printing (3/96)

Article Created: 25 October 1995
Article Reviewed/Updated: 4 March 1996

TOPIC -----

I am trying to configure my LaserWriter Pro 810 for printing with TCP/IP. How do I need to set this up?

DISCUSSION -----

Connecting the LaserWriter Pro 810 to Ethernet

TCP/IP printing to the LaserWriter Pro 810 is supported only through Ethernet, there is no Token Ring support.

You should ensure that you have the appropriate Ethernet adapter installed in the LaserWriter Pro 810. Apple supports both thin coax and twisted pair with the following:

Service Part

661-0853 - Ethernet, 10 Base T
661-0854 - Ethernet, 10 Base 2

You should power the printer on after installation to confirm that the Ethernet card is recognized. The startup page will have an Ethernet icon if the interface is active.

Detailed instructions on Ethernet installation can be found in the "Network Installation and Configuration Manual":

Rev A, Part 1, Section 2.1-3.2, (p 2-1 to 3-2)
Rev B, Part 1, Section 2.4-5 and 3.1-2, (p 2-7 to 3-2)

Setting The IP Address =====

NOTE: BOOTP cannot be used to configure an IP number. The IP address of the printer can be changed by 2 methods:

- RARP (reverse address resolution protocol)
- RCF (remove command facility).

Check for an already assigned IP number -----

Using the front control panel:

- 1) Press offline
- 2) Press print status
- 3) Press online.

Three pages will print out. On page two, "printer configuration" a section for Ethernet, and a field for IP address.

Reverse address resolution protocol (RARP) -----

RARP requires a UNIX host with rarpd support on the same subnet as the LaserWriter Pro 810.

Instructions for RARP are contained in Network Configuration and Installation Manual:

Part 2, Section 3.4.1 (page 3-9) of Rev A
Part 1, Section 2.3.3 (page 2-6) of Rev B

RARP cannot configure subnet or gateway information. You will have to connect via RCF to configure the other settings.

Remote Control Facility -----

Login to the LaserWriter 810 via Maintenance Port, TELNET or NCP.

The Maintenance Port requires using a serial to RJ12 cable, and connect at 9600 bps, 8 bits, 1 stop bit, no parity.

Cable pinouts for RJ-12 to DB-25 (typical DOS serial connector) are in (both Rev A & B)

Part 1, A-2 (page A-2)

- TELNET works only if the LaserWriter Pro 810 already has an IP address.
- NCP connects at the Ethernet address level, and does not require a pre-existing IP address. Become privileged by typing:

su

Enter the system password (default is "system").

Change the IP address by using:

DEFINE SERVER IP w.x.y.z
substitute desired address with w.x.y.z

Restart printer and print configuration page to confirm change.

Configuring gateway and subnet mask

To define the server subnet mask, enter the following command:

Define server subnet mask <w.x.y.z>

Confirm by restarting computer and entering the following commands:

Show server tcp

Define node <w.x.y.z> gateway default

NOTE: Users should not use the set/define/change route command unless they have a specific network configuration that requires complex routing tables.

Apple Remote Access: Dialing String Length (10/95)

Revised: 10/25/95
Security: Everyone

Apple Remote Access: Dialing String Length (10/95)

=====

Article Created: 25 October 1995

TOPIC -----

I'm using the Apple Remote Access (ARA) Client 2.0.1, and I want to enter a 39 character string in the Long Distance Access setup of the Dial Assist control panel (10 digit phone number, 2 commas, 14 digit credit card number, 4 commas, and 9 digit phone number). When I have tried to connect, ARA seems to only dial the first 31 characters. Is there a limit of characters ARA can dial?

DISCUSSION -----

This is not a limitation of ARA. Different modems may have different maximum command line lengths that they will accept. This maximum is defined in the mlts resource of the modem script. If an mlts resources is not defined then ARA assumes a default length of 30 characters. ARA also provides the ability to break one long string up into substrings, but the specific modem script must be written to take advantage of this feature. If the modem script you are using does not dial all the characters you are entering contact the modem manufacturer for an updated script.

ARA: Credit Card Number Visible in Activity Log (10/95)

Revised: 10/25/95
Security: Everyone

ARA: Credit Card Number Visible in Activity Log (10/95)

=====

Article Created: 25 October 1995

TOPIC -----

I use my long distance credit card number when connecting with Apple Remote Access (ARA) by entering the number in the Long Distance Access field of the DialAssist control panel. I've noticed that the Activity Log shows my credit card number instead of black dots, and I'm concerned other people using my PowerBook can get my credit card number from the Log. Is there a way to hide my credit card number?

DISCUSSION -----

To keep your credit card number from appearing in the Activity Log, enter the credit card number in the Suffix field of the DialAssist control panel. If you enter your credit card information in the Long Distance Access field of the DialAssist control panel, the number will be visible in the Log.

PowerBook 190 & 5300: PC Card Usage Affects Battery Life (10/95)

Revised: 10/26/95
Security: Everyone

PowerBook 190 & 5300: PC Card Usage Affects Battery Life (10/95)

Article Created: 26 October 1995

TOPIC -----

Will inserting PC (PCMCIA) cards into a Macintosh PowerBook 190 or 5300 series computer reduce battery life?

DISCUSSION -----

Inserting PC (PCMCIA) cards into the PowerBook 5300 or PowerBook 190 will reduce battery life. This is more evident if the cards are active or in use. However, PC cards do draw some power when they are just inserted and not in use. Most cards have two states, idle or in use.

How to Minimize PC Card Power Usage

- Eject the PC card. This is the best way to minimize power usage.
- Use a different PC card. The amount of power drawn by a PC card varies per individual PC card and by different manufacturers' designs. To test whether your PC card may be drawing more power than you think it should, causing the battery to drain too quickly, you may want to swap it with another similar PC card or a different brand of PC card.
- Do not insert PC cards which are not needed. Eject the PC card when it is no longer in use.
- Plug it in to AC power rather than running from the battery. In most circumstances when a person would need to use a modem or network, there is a power outlet nearby. Apple recommends using the AC adapter, when AC power is available, to retain a full battery charge for times when external power is not available.

Open Transport 1.0.8 Read Me (1/97)

Revised: 1/17/97
Security: Everyone

Open Transport 1.0.8 Read Me (1/97)

=====

Article Created: 26 October 1995
Article Reviewed/Updated: 17 January 1997

TOPIC -----

This article is the Open Transport 1.0.8 Read Me file.

DISCUSSION -----

What is this version of Open Transport?

Open Transport 1.0.8 is a maintenance release of Open Transport networking software.

What Macintosh systems are able to use this software?

Open Transport 1.0.8 is designed for installation on Power Macintosh 7200, 7500, 8500, and 9500 computers that have Open Transport version 1.0.6 or 1.0.7 and System Software 7.5.2 version 2 installed. If you have a Power Macintosh 7200, 7500, or 8500, the correct version of system software is already installed. If you have a Power Macintosh 9500, check to see if "System Enabler 1.1" is in your System Folder. If you have System Enabler 1.1, you have System Software 7.5.2 version 2.

Who needs this software?

Anyone that has a Power Macintosh 7200, 7500, 8500, or 9500 computer and is experiencing one or more of the problems described below.

What has changed in this release?

This section documents only the changes made since version 1.0.7. Changes made in earlier updates have been documented in the Read Me files accompanying each version.

Changes to Open Transport AppleTalk software

- DDP CheckSum

Open Transport DDP now properly handles a checksum of \$FFFF. In earlier versions, the computer could appear to freeze because packets with a checksum of \$FFFF were rejected.

- QuickMail out of sockets

When attempting to verify addresses with the QuickMail 3.0.4 client, the software would display the error message: "NameServer Communications Error. Try again, or increase time outs for NameServer using QM Time outs." This bug has been fixed.

Changes to Open Transport TCP/IP software

- BootP

Corrected a bug in the TCP/IP control panel that could, under some circumstances, prevent accepting the gateway and domain name server addresses provided by a BootP server.

- Eudora e-mail

Problems with sending mail from Eudora when using SLIP or PPP have been fixed.

- Aborting Netscape Connections

Aborting Netscape connections sometimes caused a crash when using Open Transport. This problem has been fixed.

- DHCP/Windows NT

Previous versions of Open Transport TCP/IP software were able to obtain an IP address and subnet mask, but no other settings, from Windows NT DHCP servers. With this release, Open Transport TCP/IP explicitly requests a domain name, default gateway address, domain name server address, subnet mask, and subnet broadcast address in addition to an IP address.

Printing Problem with System 7.5.2

On Power Macintosh 7200, 7500, 8500, and 9500 computers using System 7.5.2, it may be necessary to restart your computer if you attempt to print to a network-based printer that is already busy. The file "7.5.2 Printing Fix," which solves this problem, is available in the Apple Software Updates areas on the services:

* America Online - keyword: applecomputer

* CompuServe - GO APLSUP

* Internet -

- Worldwide Web: <<http://www.info.apple.com/swupdates>>

- ftp: <<ftp://ftp.info.apple.com>>

Compatibility Problem with MacPPP and FreePPP

Power Macintosh computers using Virtual Memory (including RAM Doubler) may crash when using MacPPP 2.1.2SD or FreePPP (1.0 and 1.0.1). The crash occurs when opening a PPP connection or during a data transfer. To avoid this problem, turn off Virtual Memory.

This problem is not related to Open Transport, and is expected to be addressed in a later release of FreePPP. To find out when the next FreePPP release is available, look for an announcement in the comp.sys.mac.comm newsgroup. The next version of FreePPP is expected to be available for ftp from the /comm/tcp/ directory of the InfoMac archives.

How do I install the software?

Open Transport 1.0.8 is delivered as a full installation of the Open Transport software; unlike some previous updates, there is no patching application supplied. To install Open Transport 1.0.8, run the Installer script supplied by following these steps:

- 1) Open the OT 1.0.8 folder.
- 2) Double-click the Installer icon.
- 3) In the Welcome box that appears, click OK.
- 4) In the Easy Install box, make sure the disk named is the disk you want to install Open Transport on, then click Install.
- 5) When the installation is finished, click Restart to restart your computer in order to use Open Transport 1.0.8.

TOPIC -----

This article is a series of questions and answers of general information on Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What is Apple Open Transport?

Answer: Apple Open Transport is the modern networking and communications subsystem for the Mac OS. Open Transport is based on industry standards and brings a new level of networking connectivity, control, and compatibility to Mac OS systems, while preserving and enhancing the hallmark of the Macintosh and Mac OS -- built-in support for easy-to-use networking.

Question: What long-range Apple goals are advanced through Open Transport?

Answer: Apple believes that communications and collaboration technologies are integral and fundamental to personal and workgroup computing. With Open Transport our goal is to provide the foundation to make the Mac OS the best desktop OS for multi-protocol networking, anywhere.

Question: What needs must be addressed to be "the best"?

Answer: Networking and communications technologies are mission critical -- thus reliability is a base-level requirement. Organizations require interoperability in heterogeneous environments; full compliance with standards is necessary.

High performance is also key. Increasing file sizes -- often related to the rich media types found in graphics and publishing, multimedia, video production, and technical markets -- create a demand for effective use of higher bandwidth communications technologies such as ISDN, FDDI, fast ethernet and ATM.

Beyond these base-level requirements network managers, end-users and developers each have additional needs.

- Network managers need networked systems to support a flexible model of administration that accommodates both centralized and decentralized management models.
- Users are typically more interested in using communications as a basis for productivity applications. As such, they want networking that is easy to set up and easy to use. This becomes even more important when users are mobile, needing access to networking services from wherever they may be -- without requiring complex reconfiguration for each connection type.
- Developers need to address the broadest possible markets with minimum incremental investment. In short, they need standards-based, cross-platform APIs and development tools.

Question: What were some of the key goals driving the development of Open Transport?

Answer: Apple began with two key assumptions: that networking is inherently a multiplatform, multi-protocol proposition; and that customers cannot (and should not have to!) start over to achieve networking interoperability. This led us to adopt five key design goals:

- Open Transport must protect customer and developer investments in existing network infrastructure and applications.
- Open Transport must be based on existing cross-platform industry standards.
- Open Transport must provide users with an easy to set-up, easy to use abstraction of the underlying complexity of multi-protocol networking.
- Open Transport must also provide a complementary abstraction of networking and communications services for applications developers.
- Open Transport must offer a flexible run time model - one that lets a specific protocol be configured and selected at run time, rather than linked at compile time.

TOPIC -----

This article is a series of questions and answers about the key features and benefits in Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: How will Open Transport benefit users?

Answer: Open Transport provides individual computer users with many benefits. Two of the most immediately visible and important benefits relate to making networking more accessible.

First, Open Transport makes it easy to switch from one network configuration to another. A computer user "on the go" might want to hook up to the Internet in various locations, each requiring a different network configuration. With Open Transport settings for each network location can be stored for easy access and use. Changed settings are available immediately - no reboot of the computer is required to use the new configuration.

Second, Open Transport integrates on-line help, based on AppleGuide technology, to make it easier for an individual to hook up to an network, with fewer demands on network manager and support resources.

Question: How will Open Transport benefit network managers and organizations?

Answer: Open Transport provides significant new flexibility in setting up network configurations; with Open Transport, the network manager can recommend

or require configuration settings for users on the network, or allow users to determine their own settings.

Open Transport also improves support for centralized configuration management. For example, Open Transport/TCP supports the Dynamic Host Configuration Protocol (DHCP), allowing network managers to administer addressing and other TCP/IP configuration information from a central server.

Question: How will Open Transport benefit developers?

Answer: Open Transport is designed to make it easier and more cost-effective to develop Macintosh-based applications for a wide variety of customers and markets. With Open Transport the Mac OS has built-in networking and communications based on cross-platform industry standards, including the POSIX compliant X/Open Transport Interface (XTI), UNIX STREAMs and Data Link Provider Interface (DLPI).

Applications written to support Open Transport can directly support a wide range of networking environments (serial, dial-up network, LAN, and WAN), and multiple protocols (AppleTalk, TCP/IP, serial, and others) from a common code base. This capability is sometimes referred to as transport independence.

Question: What is transport independence? Why is it important?

Answer: Different people judge networking in different ways. End-users focus on what they can do using the network, and tend to select applications based on functionality and ease of use. Network managers are interested in delivering reliable network services in a cost efficient manner. Developers want to create compelling functionality for users, but are strongly influenced by the availability of networking infrastructure.

Unfortunately, with current networking tools and systems developers are forced to tie their applications to specific network infrastructure requirements -- driven by their API choices. This creates a potential conflict between individual and organizational needs. If network managers restrict protocols to control support costs, users may not have access to the applications they need. If user require specific applications they may increase support costs for the network manager by "dragging along" specific network infrastructure requirements. Developer are stuck in the middle, making decisions for both users and network managers by selection of an API at compile time.

Transport independence is a concept that breaks this undesirable linkage. When implemented, it allows developers to write to a uniform set of APIs, users to focus on selecting the best applications, and network managers to make independent decisions about network infrastructure, all on an ongoing basis.

Question: What benefits can be realized from transport independent applications?

Answer: For end-users, transport independence brings an increased freedom to

select applications that meet their needs, without being concerned with the bits and bytes of networking protocols. For network managers, transport independence allows increased flexibility in designing and controlling infrastructure demands arising from support of end-user applications, that is, the freedom to manage the bits and bytes of networking protocols.

Developers who create transport independent applications will find access to broader markets with incremental resources; code written for the AppleTalk market, for example, can be delivered to TCP/IP markets as well.

Question: How does Open Transport enable transport independence?

Answer: Open Transport brings together four technologies to support the development and deployment of transport independent applications on the Mac OS:

- a set of look-and-feel guidelines that promote consistency for configuration of network services across protocols,
- a unified set of cross-platform, standards-based APIs for all networking and communications protocols; for example, applications can send and receive data over an AppleTalk LAN or the TCP/IP-based Internet using the same programming interfaces,
- a dynamic link-and-load architecture and set of protocols; protocols are loaded and unloaded on demand, conserving system resources, and making it possible to substitute TCP for ADSP at the application launch time (for example), and
- an addressing and naming support tool box; for example, applications can open a communications end-point by name (that is, "seeding.apple.com" or "printer16:LaserWriter@sales"; Open Transport will automatically provide the appropriate name-to-address mapping services (that is, DNR, NBP, and so on).

Together these support the creation of transport independent applications on the Mac OS.

Question: Are all Open Transport applications transport independent?

Answer: No. While Open Transport provides the necessary foundation, there are certain guidelines and programming practices required for developers to create transport independent applications. For example, most protocols have many features in common - but also some features that are protocol-specific. If an application depends on a protocol-specific feature, then it will depend upon that protocol as well.

In some cases it may be appropriate or desirable to develop a transport-specific application. For example, an MBone client is currently only useful when communicating using TCP/IP.

Question: Does transport independence imply that my organization can offer "AppleTalk services" without supporting "AppleTalk protocols"?

Answer: For each service and network environment, protocol and services choices will be determined by a combination of factors; transport independence is only one of them.

This begins with both the client and the server implementations of the particular service of interest (file, print, e-mail, directory, security, back-up, calendar, and so on) supporting the Open Transport APIs. Next, both the client and server must have the protocol stack(s) of choice installed. Finally, the server application must include some administration utility to allow the network manager to specify the protocol(s) over which application and/or presentation layer services are to be provided.

The user experience for selecting the server (that is, "Choosing", or "name-binding") may vary depending on the underlying protocol. For example, AppleTalk offers a distinctive user experience through the "Chooser" and the underlying NBP/ZIP protocols. TCP/IP offers a substantially different model for name-to-address translation (DNS); NetWare/IPX still another (NDS).

Open Transport 1.0.8: AppleTalk Features Q & A (3/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on the AppleTalk features in Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What are some of the upgraded protocol features of Open Transport/AppleTalk?

Answer: Open Transport/AppleTalk now includes new support for assigned (manually administered) protocol addresses. This allows AppleTalk nodes to be managed using protocol address as a unique and stable identifier. It also reduces some of the network traffic associated with AppleTalk's dynamic address assignment features (AARP).

Dynamic addressing continues to be available for those customers who prefer the automated address allocation.

Question: Does the use of AppleTalk manual addressing increase the requirement for network administration?

Answer: Open Transport/AppleTalk offers network administrators a choice. Sites that prefer to have the network infrastructure automatically assign unique protocol addresses can continue to rely on AppleTalk Address Resolution Protocol (AARP). Sites that find advantage in having fixed and well-known protocol addresses for each end-node can implement manual addressing.

When manual addressing is selected there will be a requirement to allocate and assign the initial protocol addresses, which will subsequently be "locked". Some administrators may prefer to do this allocation based on a central numbering plan, creating individual configuration templates (recommended or required settings) for each user. Others may prefer to allow the network to determine the initial address configuration (that is, use dynamic addressing once), and then lock the uniquely assigned addresses after initialization.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently - either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict between a new dynamic node acquiring an address assigned to an off-line, manually-addressed node. Administrators can enforce the addressing policy for a subnet by locking the addressing mode in the "dynamic" or in the "manual" state. As an administrative precaution, however, Open Transport/AppleTalk does continue to check for the presence of duplicate protocol addresses on the LAN when static addressing is configured.

Question: Are there other benefits that arise from the new support for AppleTalk manual addressing?

Answer: Yes. Manual configuration of static AppleTalk addresses supports Mac OS products that utilize WAN datalinks where non-full-mesh topologies are important. This includes datalinks such as Frame Relay, SMDS, and ATM.

Question: Is Open Transport/AppleTalk "AppleTalk Phase 3"?

Answer: No. Open Transport/AppleTalk is a new, modern implementation of the AppleTalk Phase 2 protocol architecture for the Mac OS -- from the people who invented AppleTalk.

Question: What happened to the "Network" control panel?

Answer: The Network Control Panel has been replaced by the Open Transport AppleTalk configuration utility. This change was made to reflect the true function of the utility.

Question: Are there other changes to the human interface for AppleTalk?

Answer: Yes. The AppleTalk configuration utility now provides basic troubleshooting information as a part of the human interface. For example, the Advanced and Administrator views provide access to the current AppleTalk router address and the current AppleTalk network number range for the cable. Previously this information was only available through the use of router administration software, or protocol analysis software.

Open Transport 1.0.8: TCP/IP Features Q & A (3/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on the TCP/IP features in Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What are some of the changes to the human interface for Open Transport/TCP?

Answer: The Open Transport/TCP configuration application represents a complete overhaul of the human interface from the MacTCP software it replaces. In addition to generic new features noted elsewhere (multiple saved configurations, recommended and required settings, on-line documentation, and so on), key new features include:

- direct entry of IP addresses and subnet mask in standard "dot notation";
- explicit selection of desired configuration method, now including DHCP;
- support for attachment to networks using Classless InterDomain Routing (CIDR);
- support for multiple entries in the router, name server, and explicit domain search lists; and
- improved support for large AppleTalk networks when using MacIP server/gateways.

Question: What are some of the upgraded features of Open Transport/TCP protocol stack?

Answer: With the broad adoption of TCP/IP -- and the tremendous excitement and visibility of the Internet -- Apple has made a significant investment in bringing a workstation-class implementation of TCP/IP protocols to the Mac OS. As with MacTCP, Open Transport/TCP is a full 32-bit stack. Open Transport/TCP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies;
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol;
- IP multicast, for participation as an MBone client;
- simultaneous TCP connections limited only by installed memory and processor power, for increased functionality as a Internet or other TCP/IP network server;
- ethernet version 2 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts;
- implicit and explicit domain name search paths, for increased control of domain name resolution; and,
- multiple IP routers with fail-over, for increased robustness in mission critical applications.

Question: How does the new support for Dynamic Path MTU discovery work?

Answer: Open Transport/TCP sets the "don't fragment" bit unless the packet size is larger than the MTU for the network. Intermediate routers are required by current RFCs to send back an "ICMP can't fragment" error when presented with a "don't fragment" packet that cannot be forwarded without fragmentation with that MTU size. In that event, Open Transport/TCP moves to the next smaller MTU size for that path and re-sends the packet, again with the "don't fragment" bit set. This process results in using the largest supported MTU size for off-subnet traffic.

Question: Which DHCP servers are supported by Open Transport/TCP?

Answer: Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport/TCP has been tested with the following DHCP server implementations:

- Competitive Automation,
- FTP Software (<http://www.ftp.com>),
- Hewlett Packard HP-UX (<http://www.hp.com>),
- Microsoft Windows NT Advanced Server (see Network Planning and Administration),
- Silicon Graphics (<http://www.sgi.com>),
- Sun Solaris and SunOS (<http://www.sun.com>), and
- TGV (<http://www.tgv.com>).

Question: Does Open Transport/TCP support DHCP address leases?

Answer: Yes. Open Transport/TCP fully supports DHCP address leases. Open Transport/TCP will automatically attempt to renew any address lease that reaches it's Renewal Interval, which defaults to half of the lease's lifetime. (The Renewal Interval may be configured to a different value by making changes to the configuring DHCP server). Renewal will be attempted regardless of how many times the lease has already been renewed. Should an interface's IP address lease expire, the interface will be closed down.

Question: Does Open Transport/TCP support MacTCP "Server" addressing?

Answer: MacTCP Server mode addressing is a combination of the Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. When Server mode is selected, MacTCP will use BootP to attempt to acquire an IP address. If BootP fails to provide a valid address it would then try RARP. Whichever protocol was successful would be stored as a preference, and would be used first on next system startup. While this "fall-back" approach added a degree of robustness from the users point of view, it also added a degree of unpredictability from a network administrators point of view.

Based on customer feedback, Open Transport/TCP allows a network administrator to explicitly specify the single method they prefer to use. Thus while both RARP and BootP are supported, the Server mode does not appear as a choice in the Open Transport/TCP configuration utility.

Question: Does Open Transport/TCP support MacTCP "Dynamic" addressing?

Answer: No. MacTCP "Dynamic" mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set-up a Macintosh only stand-alone TCP/IP network. Use of this Dynamic Addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (the IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Apple has adopted the industry standard DHCP and dropped support for the earlier Apple "Dynamic" mode addressing with Open Transport/TCP.

Question: Does Open Transport/TCP support a local HOSTS file?

Answer: Yes. Open Transport/TCP supports a HOSTS file, stored in the System Preferences folder, that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. This file is parsed when Open Transport/TCP is initialized. As in MacTCP, the supported HOSTS file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Should a HOSTS file be used, every effort should be made to keep it as small as possible, and to only include entries that will be accessed frequently. This reduces the total memory footprint required to cache the DNS information and

minimizes the need to maintain and update the HOSTS files as system information changes over time.

In order to activate a HOSTS file, Open Transport/TCP must be configured using either the Advanced or Administrator mode to select the appropriate file. The text file must already exist, and can be created with any text editor or word processor. Also note that the HOSTS file selection is tied to the selected configuration. An administrator might, for example, specify different HOSTS files for use when a user connects via ethernet on the campus LAN and that same user when dialing-in from a remote location.

Supported features include blank lines, comments (indicated by a semicolon), and data entry. Comments may begin at any location in a line; they may follow data entry on the same line. A comment extends from the semicolon to the end of the line. Data entry must follow the format:

```
<domain-name> <rr> [<comment>]
```

where <domain-name> is an absolute or Fully Qualified domain name. The FQDN need not be terminated by a dot, but must contain at least one dot internally, and where

```
<rr> = [<ttl>] [<class>] <type> <rdata> OR [<class>] [<ttl>] <type> <rdata>
```

The only <class> currently supported is IN (Internet Domain); <ttl>, time to live, indicates the record's configured lifetime in seconds; and <type> can be A (host address), CNAME (canonical name of an alias), or NS (name server). If <ttl> is not present the entry is assumed to have an infinite lifetime; this may also be indicated by specifying a value of minus-one (-1). \$INCLUDE and \$ORIGIN are not supported.

Open Transport/TCP is somewhat more stringent regarding the format and content of the HOSTS file than was MacTCP. MacTCP permitted violation of the Fully Qualified requirement for <domain-name>; this feature was often used to avoid the necessity for entering CNAME records by associating an address directly with a non-fully qualified name. For instance, this format:

```
charlie                A                128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie                CNAME            myhost.mydomain.edu
myhost.mydomain.edu    A                128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

Question: How does the new Open Transport/TCP Domain Name Resolver work?

Answer: When a client of the DNR requests a name-to-address mapping, the DNR checks for a "." at the end of the name. If it exists the name is assumed to be fully qualified (RFCs 1034 and 1035), and the DNR will search for that name. If the name contains at least one "." internally but does not end with "." it is considered to be provisionally fully qualified. The DNR will begin a search for these names without further manipulation.

Otherwise the name is assumed to be partially qualified. The DNR will begin a search for the name in the domain name configured in the "Default Domain name:" field. For example, an attempt to resolve joe with a Default Domain of tech.support.apple.com would look for joe.tech.support.apple.com.

If the requested name is not found and an optional Admin Domain has been configured using either the Advanced or Administrator mode, implicit searches will take place next. Continuing with the example, with a Default Domain of tech.support.apple.com and an Admin Domain of apple.com, a search for the name joe would look for the following additional names:

joe.support.apple.com
joe.apple.com.

Implicit searching will stop when the name is resolved, or when the FQDN becomes equal to the name-to-be-resolved concatenated with the Admin Domain (that is in the example no implicit search would be made for joe.com). Implicit searching will not be attempted unless an Admin Domain is explicitly configured and the Default Domain is a subdomain of the Admin Domain (per RFC 1535).

If the name is still not found, the explicit Search Domains are searched. For each search domain the configured name server(s) are contacted in the order specified in the Name Servers field. If the name is resolved in the first search domain that answer is returned; other Search Domains will not be checked. If an authoritative answer that the "name-does-not-exist" is returned the DNR immediately begins the search in the next configured Search Domain. The search continues through the configured Search Domains. If still no match is found, the DNR will search the root domain if it makes sense to do so.

The DNR has an overall time-out of 2 minutes, after which it will abandon its search.

Question: What is MacIP?

Answer: MacIP, sometimes also referred to as KIP (Kinetics Internet Protocol), is a protocol specification developed as a method for carrying TCP/IP traffic on AppleTalk only networks -- originally these would have been LocalTalk networks. MacIP is today frequently used in conjunction with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services. MacIP specifies encapsulation of TCP/IP datagrams in AppleTalk packets for transmission over such connections.

Use of MacIP requires a MacIP gateway. AppleTalk encapsulated IP packets are

sent to the MacIP gateway using AppleTalk protocols (DDP). The gateway strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are destined for the MacIP end-node, that gateway provides the needed encapsulation services.

MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network, acting as a middleman between the MacIP end-node and the appropriate TCP/IP-based hosts on the LAN or WAN.

Open Transport includes end-node support for MacIP. A end-node is configured to use MacIP using the TCP/IP configuration utility by selecting "AppleTalk (MacIP)" in the "Connect via:" pop-up menu. The user (or network administrator) must also specify where on the network (in which zone) to look for the MacIP gateway. Once selected, TCP/IP will be encapsulated in AppleTalk and will be sent out the "Connect via:" interface selected using the AppleTalk configuration utility.

Open Transport 1.0.8: Network Interface Options Q & A (3/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on the network interface options in Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What network interface options are available with Open Transport?

Answer: Open Transport v1.0 supports PCI-bus NICs and Macintosh built-in (LocalTalk and ethernet) network adapters. Beginning with v1.0.6, Open Transport adds support for infrared and PC Card (formerly known as PCMCIA) network adapters on select Macintosh systems.

Third party options available for Open Transport include fast ethernet, ATM, and FDDI.

Question: What about dial-up network connectivity solutions?

Answer: For connectivity to AppleTalk networks, Open Transport supports Apple Remote Access v2.0.1 client and personal server through backward compatibility services. For dial-up connectivity to TCP/IP networks including the Internet, Open Transport supports select third party MacTCP software extensions (known as mdevs), providing SLIP or PPP connectivity. See Network Compatibility for more information.

Open Transport 1.0.8: Availability & Distribution Q & A (4/97)

Article Created: 27 October 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article is a series of questions and answers on the availability and distribution of Apple Open Transport 1.0.8.

Open Transport 1.1.1 (as well as OT 1.1.2 for selected machines) is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What is the current production version of Open Transport?

Answer: Open Transport v1.1.1. This maintenance release was designed and is recommended for all PCI-bus Power Macintosh systems. It includes the following changes:

- Open Transport/AppleTalk's DDP implementation will now properly handle a checksum of \$FFFF. In earlier versions, packets with a checksum of \$FFFF would be rejected, resulting in unnecessary retransmissions of data.
- When attempting to verify addresses with the QuickMail 3.0.4 client, the software would come back with an error message that read "NameServer Communications Error. Try again, or increase time outs for NameServer using QM Time outs." This bug has been fixed.
- Corrected a bug in the Open Transport/TCP control panel that could, under some circumstances, prevent the acceptance of the gateway and domain name server information provided by the BootP server.
- Problems with sending mail from Eudora when using SLIP or PPP have been fixed.
- Aborting Netscape connections could sometimes cause a crash. This problem has been fixed.
- Previous versions of Open Transport/TCP were unable to fully configure

from Windows NT DHCP servers. Unlike most DHCP servers, Windows NT does not provide DHCP options unless specifically requested by the client. Open Transport/TCP 1.0.8 now requests a domain name, default gateway address, domain name server address(es), subnet mask, and subnet broadcast address, in addition to an IP address.

More complete details on the changes incorporated in v1.0.8 are found in the current Open Transport Release Notes. These are available by anonymous ftp from <ftp://seeding.apple.com/opentransport/>

Question: How is Open Transport v1.0.8 made available to customers?

Answer: Open Transport v1.0.8 is planned to be distributed via a variety of information services and a number of Internet sites. This release is distributed as a full installation of Open Transport software - not an updater or patcher.

- * America Online - keyword: applecomputer
- * CompuServe - GO APLSUP
- * Internet -
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com>>

The software is only designed to work on PCI-bus Power Macintosh systems, and is recommended to customers who are experiencing one or more of the problems identified above as fixed with the 1.0.8 release.

Question: Summarize the earlier Open Transport v1.0.x releases?

Answer: Open Transport version 1.0 was focused on offering strong backward compatibility with existing networking client applications, and on significantly upgrading the feature set and performance of TCP/IP on the Mac OS.

Version 1.0.1 was a maintenance update, designed to correct a potential problem with data truncation in large file transfers.

Version 1.0.6 added support for the Power Macintosh 7200, 7500, and 8500 systems, and addresses bugs discovered since the initial 1.0 release.

Version 1.0.7 included further changes to improve performance and compatibility of Open Transport/TCP with third party SLIP and PPP connections, and to accommodate certain Internet Service Provider (ISP) address assignment practices.

Question: How was Open Transport v1.0.7 made available to customers?

Answer: Open Transport v1.0.7 is distributed electronically, as an update to be applied to an existing installation of Open Transport v1.0.6. The update is available on a variety of information services and a number of Internet sites

including

ftp://seeding.apple.com/opentransport/update/OT_1.0.7_patch/

Question: How was Open Transport v1.0.6 made available to customers?

Answer: Open Transport v1.0.6 ships as a built-in component of Mac OS system software (System Software 7.5.2 version 2) on the Power Macintosh 7200, 7500, and 8500 models. Software on newly manufactured Power Macintosh 9500 systems is updated to this release as well.

Customers who previously bought a 9500 can get this system software update (which contains System 7.5.2 version 2 and Open Transport 1.0.6) by calling the Apple Order Center. This system software update is recommended for all Power Macintosh 9500 customers.

Question: Will Open Transport be made available to software developers, publishers, and/or Internet Service Providers (ISPs) for redistribution and bundling options?

Answer: Yes. Following the availability of Open Transport v1.1 Apple is planning to offer two redistribution licensing agreements for Open Transport, to meet the needs of publishers, developers, and ISPs.

The first agreement is designed for Internet service providers, network and communications reference work authors and publishers, and others interested in bundling Open Transport software as an added customer benefit to their product or service offering. This license is planned to be based on a sliding-scale per-unit license fee, and will require annual reporting of licenses issued.

The second agreement is designed for software developers with products that adopt the new Open Transport APIs who wish to ship Open Transport as a part of an integrated product installation process. This agreement is to be based on the Mac OS SDK, and would allow qualified developers to ship the Open Transport run-time environment to end-users as a part of their product.

To qualify, developers would execute the Open Transport License Addendum, and meet the following requirements:

- have developed an Open Transport-ready or Open Transport-enhanced software product,
- be current subscribers to the Mac OS SDK,
- provide Apple advance notice of their intent to ship their Open Transport product(s),
- distribute the required Open Transport components only in conjunction with their product(s), and,
- annually report the total number of licenses issued. Other terms and conditions may apply, however, no additional fees (beyond the Mac OS SDK subscription) are planned for this license.

Final details on these agreements will be available later this year. Interested developers should send electronic mail to OT.LICENSE@seeding.apple.com

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Open Transport 1.0.8: Network Planning & Admin Q & A (3/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on the network planning and administration of Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Will Open Transport require organizations to make changes in network administration, planning, or design?

Answer: The first Open Transport protocols -- AppleTalk and TCP/IP -- offer new features that give a network manager more flexibility and control. Some of these features, when implemented in a network environment will require additional thought and planning by a network manager.

In particular, Open Transport/AppleTalk adds support for the use of static (manually assigned) AppleTalk node addresses. If implemented, a network manager may prefer to assign addresses based on a pre-designed protocol address management plan. Open Transport/TCP adds support for the Dynamic Host Configuration Protocol (DHCP). DHCP allows network managers to allocate IP addresses and other configuration information from a DHCP server. Optimum deployment of DHCP services within an enterprise does require planning.

In order to better conform to applicable standards, Open Transport/TCP also has somewhat more rigorous requirements regarding the content and format of the local HOSTS file. See TCP/IP Features for more information.

Question: Does Open Transport offer network managers more control over Mac OS

networking?

Answer: Yes. Open Transport allows network managers to specify details of the network connection and configuration in advance, via a "preferences" file. These configurations may contain a mixture of user-provided information and network manager recommended and/or network manager required settings. Recommended data provides a default for the end-user, while required configuration data is locked with an administrator's password.

Open Transport configurations can be prepared on one machine and distributed to other systems. To support this, the Open Transport configuration utilities allow a configuration to "exported" and "imported". Exported configurations can be distributed via electronic mail, a file server, or even "sneaker net".

Question: Can Open Transport/TCP act as a DHCP client to a Windows NT Advanced Server?

Answer: Yes. However, due to significant differences between the Microsoft Windows NTAS implementation of DHCP and typical UNIX-based servers, there have been some interoperability issues with Open Transport 1.0.x:

- Customers running Open Transport v1.0 or v1.0.1 will not be able to acquire leased IP addresses. This is due to unusually long reply-time-out values used in the NTAS implementation. Open Transport v1.0.6 was changed to accommodate NTAS behavior in this regard.
- Customers running versions of Open Transport prior to v1.0.8 will be incompletely configured via DHCP.

NTAS sends only IP address, IP address lease information, the configuring server's IP address, and a subnet mask. Investigation revealed that other configuration options entered in the NT DHCP server's database (default gateway address, domain name server addresses, domain name, broadcast address, and so on) were not sent unless specifically requested by the client using the DHCP Parameter Request List option.

Apple believes that this practice -- requiring use of this option in order for the client to be properly configured -- is contrary to the DHCP server specification described in RFC 1541 (Dynamic Host Configuration Protocol). This RFC documents the Parameter Request List option as a MAY, rather than a MUST or SHOULD, making required use of the parameter inappropriate. Further, this behavior appears to be unique to the NTAS implementation.

In interest of interoperability, Open Transport v1.0.8 (and the planned v1.1) uses the Parameter Request List option to request default gateways, DNS servers, domain name, subnet mask, and broadcast address. This permits Open Transport/TCP clients to be fully configured by Windows NT DHCP servers, without adversely affecting interoperability with other fully compliant DHCP servers, at the expense of a few additional packets on the wire during the initialization phase.

Question: Can Open Transport/TCP act as a WINS client to a Windows NT Advanced Server?

Answer: No, not at this time. The Microsoft WINS server is dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support) that provide some automation for assignment and registration of IP host and domain names.

The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group.

Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge. We welcome customer feedback on this topic -- should sufficient demand for a WINS client materialize, we'd be open to exploring this issue. A future Mac OS WINS client would be dependent upon Microsoft releasing sufficient technical detail regarding their proprietary extensions to IP to make an interoperable implementation possible.

Open Transport 1.0.8: Applications Compatibility Q & A (3/96)

=====

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on applications compatibility in Apple Open Transport.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Is Open Transport compatible with existing applications and network extensions?

Answer: Apple and third party developers have to date announced over 130 Open Transport compatible applications. A compatibility list is available from:
ftp://seeding.apple.com/opentransport/OT_Compat_List

Open Transport provides "backward compatibility" services in four areas:

- to support existing applications using the documented AppleTalk APIs;
- to support existing applications using the documented MacTCP APIs;
- to support existing Chooser devices; and,
- to existing NuBus based network interface cards to work with Open Transport.

Question: What is implied when an application is "Open Transport Compatible"? Does that mean that it takes advantage of new Open Transport features?

Answer: Apple has defined three levels of interoperability with Open Transport. The first, Open Transport Compatible, is used to describe a network application originally developed for "classic" AppleTalk or MacTCP, that now takes advantage

of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the new Open Transport configuration utilities. However, they will not realize a significant performance increase on Power Macintosh computers, nor can they take advantage of Open Transport's transport-independence capabilities.

The second, Open Transport Ready, are those applications that have been modified to adopt the new Open Transport APIs (XTI). They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport Ready applications not only benefit from the new configuration utilities, but have the opportunity for a significant performance boost when running on Power Macintosh.

The third and final category of interoperability is referred to as Open Transport Enhanced. In addition to adopting the new Open Transport APIs and being Power PC native, these applications have been modified to exploit the transport-independent capabilities of Open Transport, that is, they can be dynamically configured to support AppleTalk, TCP/IP, or serial communications.

Question: How is backward compatibility for AppleTalk implemented?

Answer: AppleTalk applications backwards compatibility is accomplished by intercepting all AppleTalk networking calls at the ".ddp" driver API. Above this protocol layer, applications written to the classic AppleTalk APIs continue to rely on the classic (680x0 based) implementation of AppleTalk. Calls to the ".ddp" driver are translated to the corresponding Open Transport XTI calls and are then passed to the new native implementation of DDP for processing. The process is reversed for incoming packets.

Using this approach, backwards compatibility is very robust - the classic implementations of ADSP, ASP, ATP, NBP, ZIP, and PAP are actually present (vs. simply mimicked). This also decreases the total memory footprint of backwards compatibility as compared to an implementation based on individual adaptation layers for each of the AppleTalk protocols. The primary trade-off of this approach is that applications relying on backwards compatibility do not gain any meaningful performance increases on Power Macintosh; essentially only native DDP is actually in use in these cases.

Open Transport/AppleTalk also includes broad support for existing applications software and network devices that rely on the Chooser or the Network Control Panel software for selection and configuration, known as "cdevs" and "adevs" respectively.

Question: How is backward compatibility for MacTCP implemented?

Answer: TCP/IP (MacTCP) applications backwards compatibility is accomplished by intercepting all MacTCP networking calls at the ".ipp" driver level. Calls to the ".ipp" driver are translated to corresponding Open Transport XTI calls and then passed to the native TCP/IP stack for processing. The process is reversed for incoming packets.

This approach allows most MacTCP applications to benefit from the native

implementation of the TCP/IP protocols on Power Macintosh, at least to some degree. While the backwards compatibility layer itself must run as 680x0 code, most of the handling of the packet happens in the new native Open Transport/TCP implementation. The drawback of this implementation is that "warts and all" backward compatibility is somewhat less robust; applications depending on idiosyncrasies of MacTCP or referencing internal MacTCP data structures are likely to need an update.

TCP/IP backward compatibility also includes targeted support for select software products that rely on the MacTCP (or Admin TCP) Control Panel software for configuration. Support for these software modules, known as MacTCP Link Access Modules, or simply "mdevs", is more limited than that provided for AppleTalk "adevs", due to certain technical considerations.

Question: How is backward compatibility for other network products implemented?

Answer: Certain networking extensions -- such as MacIPX from Novell or PATHWORKS (LAT and DECnet) from Digital Equipment Corp. or Thursby Software Systems -- as well as applications such as Insignia Solutions SoftWindows do not access the AppleTalk or MacTCP APIs; instead they deal directly with the Macintosh OS Ethernet driver software. With the introduction of PCI bus to the Macintosh this driver architecture and software has changed.

Additional backward compatibility software included with the System Enabler 1.1 for System 7.5.2 (that is, System 7.5.2 version 2) allows these networking extensions and applications to communicate with the new DLPI based Ethernet driver as if it were a "classic" Ethernet device.

This compatibility software supports only the built-in Ethernet adapter of Power Macintosh systems with PCI bus (7200, 7500, 8500, and 9500). Thus current versions of such network extensions and applications (those that write directly to the Ethernet driver) cannot access PCI based network interface cards.

This backward compatibility module was not available in the original distribution of System 7.5.2 for the Power Macintosh 9500 (with Open Transport v1.0). It is now included as part of System 7.5.2 version 2, or more recent, and is recommended for use with Open Transport 1.0.6 or later (see Availability and Distribution).

Question: Are there known limitations to applications backward compatibility?

Answer: Yes. Applications that rely on undocumented APIs or examine private data structures in the current AppleTalk or MacTCP may not be fully compatible with Open Transport.

Examples include the MacSNMP AppleTalk and TCP/IP Agents (however, MacSNMP and the Macintosh System Agent are compatible), the Apple Internet Router 3.x, the Apple Remote Access MultiPort Server 2.x, LaserWriter Bridge, and some utilities like MacTCP Watcher and MacTCP Spy. Updated versions of these software products will be required for full compatibility.

Question: There have been reports of problems with the use of Open Transport and MacX 1.2. Is there an Open Transport compatible X Window System server available?

Answer: Apple MacX 1.5 is compatible with Open Transport, and is a recommended upgrade for customers who have earlier versions of MacX. There is a known bug in MacX 1.2 that can cause it to crash when running on a Macintosh system with System 7.5.2 and Open Transport.

Revised: 3/26/96
Security: Everyone

Open Transport 1.0.8: Network Compatibility Q & A (3/96)

=====

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on network compatibility in Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Is Open Transport interoperable with installed AppleTalk and TCP/IP networks?

Answer: Open Transport 1.0.x is compatible with existing AppleTalk and TCP/IP LocalTalk and ethernet network at the "packets on the wire" level. Organizations can introduce one, a few, or hundreds of new Macintosh systems running Open Transport into their environment without worrying about interoperability with existing networking services.

Question: Is Open Transport compatible with existing Internet Service Provider offerings?

Answer: As noted in "Network Interface Options" Open Transport/TCP currently supports dial-up connectivity to TCP/IP networks, including the Internet, through backward compatibility with select third party software modules known as "mdevs".

With the appropriate mdev installed, end-nodes can use either SLIP or PPP to connect to Internet Service Providers and other dial-up IP-access points. However, not all versions of all mdevs are supported by Open Transport backward compatibility services. It is important that the recommended versions of

software be installed for the greatest level of compatibility.

It is also important that TCP/IP addressing and other configuration information be properly configured. As there is a new human interface provided by the Open Transport/TCP configuration utility, there are some changes in the process as compared to the older MacTCP software.

Question: Is there documentation available to assist with configuring Open Transport/TCP?

Answer: Yes. Although a full user's guide is planned for release with Open Transport v1.1, configuration tips for Open Transport 1.0.x are already available from various sites on the internet including:

ftp://seeding.apple.com/opentransport/OT_gen_info/TEXT/OTTCP_Config_Tips

Question: Does Apple offer a solution for SLIP or PPP dial-up to the Internet?

Answer: Yes. The Apple Internet Connection Kit is a selection of the most popular Internet applications from third party companies, including the Netscape Navigator and RealAudio Player from Progressive Networks, as well as Claris EMailer Lite. The kit includes MacPPP 2.1.4 along with the Apple Internet Dialer -- software designed to make it simpler for Macintosh customers to register with a qualified Internet Service Provider (ISP) and get connected to the Internet. To help users work with their Internet applications, the Apple Internet Connection Kit includes Apple Guide software for on-line assistance.

Question: What is MacPPP 2.1.4? Is it available on the Internet?

Answer: MacPPP 2.1.4 is a derivative of the MacPPP 2.1.x SD versions of Merit's PPP. It includes code contributed by Apple engineering to enhance compatibility with Open Transport/TCP. These Apple updates have also been provided to the authors of FreePPP (the successor to the "SD" releases of MacPPP).

FreePPP 1.0.x also includes these updates, and is available for download on the Internet.

Question: Does the Apple Internet Connection Kit require Open Transport?

Answer: The Apple Internet Connection Kit works with either MacTCP, or Open Transport/TCP.

Question: Which mdevs are currently supported by Open Transport/TCP?

Answer: Open Transport 1.0.8 supports the following MacTCP Link Access Modules (mdevs).

- FreePPP - version 1.0 or more recent; compatible with Open Transport.

- InterPPP - use version 1.2.9 or more recent.
- InterPPP II - use the most current version.
- MacSLIP - use version 3.0 or more recent; compatible with Open Transport.
- MacPPP - use version 2.1.3 SD, or more recent (version 2.2.0 is not recommended).

Apple is continuing to work with developers to better support existing mdevs; contact the third party developer of interest for the most recent information on compatibility.

Question: Are there known limitations to backward compatibility mdev support?

Answer: Yes. Due to differences in the underlying architectures (between MacTCP and Open Transport/TCP), and some current (1.0.8) shortcomings in the backward compatibility services, there are some additional limitations to mdev support:

- Some mdevs, when used with Open Transport, may not be able to auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application. This is being addressed by updated versions of the mdevs.
- Once a TCP/IP application launches and uses a SLIP or PPP mdev, use of a different mdev may require restarting the Macintosh. Disconnecting from and redialing a service provider may also require restarting the Macintosh. This is planned to be addressed in Open Transport v1.1 (See Future Directions).
- Some Internet Service Providers do not strictly follow standards practices, which call for assigning end-node IP addresses on the same subnet as the router (gateway). Open Transport strictly enforces this requirement in versions prior to 1.0.7. Beginning with Open Transport 1.0.7, the TCP/IP configuration utility software will automatically generate a compatible router address to facilitate connectivity to the ISP if the user leaves the router address field empty.

Question: If a user needs an updated copy of one of these mdevs, how can they get the software?

Answer: Sources for mdev software will vary, as some of the noted products are commercial and some are shareware or public domain.

- FreePPP is shareware and can be found on a variety of internet sites; typically at "info-mac" mirror sites in the comm/tcp directory. A list of info-mac mirror sites can currently be found at:

<http://www.mcp.com.hayden/iskm/info-mac-mirrors.html>

Some sites where FreePPP can be found currently include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/>

<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/>

- InterPPP and InterPPP II are commercial software products. For availability and ordering information contact InterCon Systems, US 1-703-709-5500
- MacSLIP is commercial software available developed by Hyde Park Software. For availability and ordering information contact TriSoft, US 1-800-531-5170.
- MacPPP (v2.1.4) is available as a component of the Apple Internet Connection Kit, Apple Computer Inc., US 1-800-462-4396 for fax information or 1-800-538-9696 to locate an Apple authorized reseller near you.

Question: There have been reports of problems with Open Transport, PPP, and the use of Virtual Memory. Is Open Transport compatible with Virtual Memory?

Answer: Open Transport fully supports the use of virtual memory. However there are problems identified with MacPPP 2.1.2 SD and FreePPP 1.0 when used with Open Transport and Virtual Memory (including RAM Doubler). These problems are under investigation, with Apple engineering working together with the authors of FreePPP. Current plans call for an update to FreePPP to be available once a fix is determined. In the interim, users who experience problems with PPP and Virtual Memory are advised to turn VM off.

Question: Will Apple provide a "native" SLIP or PPP solution for Open Transport?

Answer: Apple is developing an implementation of PPP for Open Transport as a part of the next generation of Apple Remote Access products. This is planned to support dial-up access to both AppleTalk and TCP/IP networks. (see Future Directions).

Question: Is Open Transport compatible with PowerTalk built-in support for SMTP mail?

Answer: Apple recently announced that it has licensed, and will distribute and maintain, the PowerTalk Internet PMSAM formerly available from StarNine Technologies. This software provides the Mac OS with built-in support for Internet SMTP mail. The Apple Internet PMSAM is fully compatible with Open Transport 1.0.x when used on a LAN. When the PMSAM is to be used over a dial-up SLIP or PPP link, the same recommendations and limitations noted above for SLIP and PPP currently apply.

Open Transport 1.0.8: Apple Adoption of OT Q & A (3/96)

Revised: 3/26/96
Security: Everyone

Open Transport 1.0.8: Apple Adoption of OT Q & A (3/96)

=====

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on Apple's adoption of Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: When will Open Transport become part of the Mac OS? Not until Copland?

Answer: Open Transport will be made available as a component of the Mac OS with a future system software integration release, currently expected in the first half of 1996.

Open Transport v2.0 is being developed as an integral part of the Copland OS release; support is planned for all Copland platforms, including the Common Hardware Reference Platform (CHRP).

Question: What Apple products will support Open Transport? Will these also be native on Power Macintosh?

Answer: Apple plans to include support for Open Transport in the following products, as well many other unannounced products:

- QuickTime Conferencing
- Apple Remote Access
- AppleShare
- MacSNMP

- PowerTalk
- Copland release of the Mac OS

Plans call for these services to go native either before, or at the same time as, they support Open Transport.

Question: When will Apple products offer Open Transport support?

Answer: Apple QuickTime Conferencing, Apple Remote Access, and AppleShare are projected to become available late in 1995 through early 1996. The Copland OS is projected to be in customer hands in the second half of 1996.

Other projects have different schedules; information will be released at a later date.

Open Transport 1.0.8 and Cross-Platform Issues Q & A (1/97)

Revised: 1/20/97
Security: Everyone

Open Transport 1.0.8 and Cross-Platform Issues Q & A (1/97)

Article Created: 27 October 1995
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This article is a series of questions and answers on Open Transport 1.0.8 and cross-platform issues.

Open Transport 1.1.2 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Where can I get the latest version of Open Transport?

Answer: Here is the current list of online locations for Open Transport, as well as other Apple Software updates.

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Question: Will Apple port Open Transport to Windows or UNIX?

Answer: Apple does not plan to port Open Transport to other operating systems. Rather, Open Transport is based on Apple porting three existing, cross-platform industry standards to the Mac OS. These standards have their roots in the UNIX community and experienced UNIX network developers will find themselves "right at home" when developing for Open Transport.

Question: What about Windows developers? What about Windows Sockets?

Answer: NetManage, the leading developer of TCP/IP protocols and applications for DOS and Windows, has announced plans to develop and offer Windows Socket tools for Mac OS, to provide access to Open Transport/TCP and MacTCP services via the Windows Sockets (Winsock 1.1) API.

Additional details of this announcement will be made public at a later date.

Question: With both XTI and Windows Sockets available for Open Transport, which API should a developer use?

Answer: The choice of API will depend upon a developer's background, experience, and goals. For developers with a background in UNIX, a need for POSIX compliance, or a need to deploy an application across Mac OS and UNIX systems, XTI is the logical choice. For developers with a background on Microsoft Windows, or a need to deploy an application across Mac OS and Windows, Windows 95, and/or Windows 95 systems, the planned Winsock tools from NetManage will provide an attractive cross-platform alternative.

Apple is committed to XTI and will focus development on transport independence around this API. Macintosh developers now using classic AppleTalk or MacTCP APIs are encouraged to move to Open Transport XTI API.

Open Transport 1.0.8 and Servers Q & A (3/96)

Revised: 3/26/96
Security: Everyone

Open Transport 1.0.8 and Servers Q & A (3/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on Open Transport and Workgroup Servers.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What role does Open Transport play for servers?

Answer: The Open Transport architecture is designed to provide server applications -- file, print, database, e-mail, directory, and other -- with a foundation for higher performance and for more flexible configuration, while maintaining the historical differentiation of Mac OS based servers -- ease of configuration and administration.

Question: How will Open Transport enhance server performance?

Answer: Servers, as network-aware applications, gain access to the higher performance Power PC native implementation of networking protocols that Open Transport provides. To exploit this performance opportunity, server applications must be accelerated for Power Macintosh and must utilize the new Open Transport XTI APIs.

Severs will also benefit through access to new high-speed PCI datalink implementations for Macintosh such as fast ethernet and ATM.

Question: How will Open Transport enhance server flexibility?

Answer: Open Transport introduces the capability of activating more than one network connection at the same time, using the same networking protocol. This capability is known as multihoming, and enables servers to support more clients, to offer greater total performance, and to increase the reliability of mission critical applications.

Finally, as discussed above, Open Transport enables the development of transport independent applications. This will be especially valuable for server applications which need to be deployed in AppleTalk, or TCP/IP, or NCP/IPX, or other protocol environments.

Question: Will Apple's server products such as AppleShare and PowerShare exploit Open Transport features?

Answer: Yes. Apple server products will adopt Open Transport, and will over time exploit Open Transport features including multihoming and transport independence. Product details will be announced at a later date.

Question: Are PCI-bus Power Macs with Open Transport 1.0.x recommended as application servers?

Answer: No, not at this time. As is discussed elsewhere in this document, to meet customer expectations in regards to anticipated increases in flexibility and performance, server applications such as AppleShare and PowerShare, as well as third party server applications need to be accelerated for Power Macintosh and adopt the new Open Transport APIs.

Question: When will PCI-bus Power Macintosh systems be recommended as servers?

Answer: Apple recommends that server application developer adopt Open Transport v1.1 as the basis for new network applications development as soon as is possible within their product life cycles. As these updated versions of server software become available customers will find that the combination of PCI-bus, Power Macintosh, and Open Transport makes a great platform for flexible, high-performance network applications.

Open Transport 1.0.8: Future Directions Q & A (3/96)

=====

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on the future directions of Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: How will Open Transport be made available to customers with 680x0 and NuBus-based Power Macintosh computers?

Answer: Open Transport v1.1 is planned to support 68030 and 68040 Macintosh computers, as well as NuBus-based Power Macintosh systems. This release is currently expected to be available in the second half of 1995:

- as a no-charge upgrade to customers with MacTCP software maintenance agreements;
- as a no-charge upgrade to customers with system software maintenance agreements;
- as a component of a planned Mac OS system software system update;
- bundled with Apple and third party applications software that are Open Transport-ready;
- as a retail software product in single-user software package; and,
- from select Apple-licensed publishers and Internet Service Providers.

Question: Will Open Transport v1.1 include additional capabilities?

Answer: Yes. In addition to support for all targeted Mac OS systems and integration of all available bug fixes, Open Transport v1.1 should also:

- provide a basis of support for PPP-based AppleTalk and TCP/IP remote networking,
- provide a basis of support for modem and ISDN communications devices,
- offer tuning to optimize performance of high speed datalinks,
- offer tuning to support multi-client, multi-threaded server applications,
- provide display of the selected datalink Media Access Control address for ethernet and token ring networks,
- provide notification in the event duplicate AppleTalk or TCP/IP addresses are established,
- automatically convert users existing AppleTalk and MacTCP setting to Open Transport configuration files,
- offer improved Balloon Help text for System 7 users, and,
- include all bug fixes available to date.

Question: Will Open Transport v1.1 be available to PCI-bus Macintosh customers as well?

Answer: Yes, Open Transport v1.1 will support PCI-bus Macintosh systems, and will be included as a component of a planned Mac OS system software System Update, and with a future Mac OS system software release.

Question: What additional network interface options are planned to be available with Open Transport?

Answer: Open Transport v1.1 is planned to add support for existing NuBus NICs, as well as backwards compatibility support for SCSI-attached ethernet adapters for those Macintosh models that do not have built-in ethernet or ethernet expansion options.

Modem and ISDN support are to be available following the introduction of the next generation of Apple Remote Access products (incorporating Open Transport/PPP and Open Transport v1.1).

SCSI-attached ethernet adapters for PCI-bus Macintosh computers will require development of new DLPI drivers.

Question: How will backward compatibility for NuBus network interface cards be implemented?

Answer: For 680x0 and Power PC Macintosh systems with NuBus, Open Transport v1.1 will allow use of existing NuBus NICs and drivers. This compatibility is to be provided by software support mapping DLPI driver calls generated by new Open Transport protocols to corresponding calls to "classic" Mac OS LAP Manager, .enet and .tokn APIs.

Question: Will PPP connectivity be distributed as a bundled component of Open Transport v1.1?

Answer: AppleTalk and TCP/IP connectivity over Open Transport/PPP links will first be offered as a feature of the upcoming Apple Remote Access products. ARA products would include necessary Open Transport components.

Apple currently plans to fully merge ARA client and personal server capabilities with basic Open Transport capabilities to offer an integrated communications package for LANs, WANs, and remote networking. These integrated capabilities are also expected to be delivered as a part of a future update to Mac OS. This timetable has not been finalized; details will be announced at a later date.

Question: Will the planned Apple Open Transport/PPP solution truly be standard PPP?

Answer: Apple is developing a native implementation of PPP for Open Transport as a part of the next generation of Apple Remote Access products. Current plans call for full support of the following RFCs:

- RFC 1661 - PPP
- RFC 1662 - PPP in HDLC-like framing
- RFC 1570 - PPP LCP extensions
- RFC 1334 - PPP Authentication protocols
- RFC 1663 - PPP Reliable transmission
- RFC 1378 - ATCP AppleTalk Control Protocol
- RFC 1332 - IPCP Internet Protocol Control Protocol

Question: What about NetWare NCP/IPX? Will Apple or Novell deliver an Open Transport-based Macintosh client that uses IPX protocols as the transport layer?

Answer: Apple and Novell have publicly committed to making Macintosh a first-class NetWare client. An Open Transport-ready implementation of NetWare protocols and client services is currently under active investigation. The two companies are not ready to announce specific product plans or availability details at this time.

Question: What about IP version 6 (IPv6) support in Open Transport?

Answer: IPv6 is an proposed update of the current Internet Protocol (IPv4), part of the TCP/IP suite of protocols used to allow computers to communicate with each other over the Internet. The Internet Engineering Task Force (IETF) is in the process of specifying the standards for IPv6.

IPv6 is being designed to respond to the limitations of IPv4 -- including an upcoming shortage of new IP addresses -- to allow for the continued expansion of the Internet and deployment on corporate networks. IPv6 also incorporates new functionality to provide security, multimedia support, and plug and play capabilities, features necessary to usher the Internet into the twenty-first century.

At the October 1995 Networld+InterOp trade show, Apple Computer and Mentat Inc.

demonstrated a prototype implementation of Internet Protocol Version 6 running on Apple Open Transport. The demonstration showed the flexibility of the Open Transport environment -- with current IPv4 applications such as Fetch, Netscape, and Web*Star running unmodified with IPv6 support -- and showed the benefits of Open Transport's underlying standards-based architecture - facilitating code portability. The demonstration also included basic interoperability testing with IPv6 prototype implementations from DEC and HP, using standard IP utilities such as Ping and Telnet.

Apple and Mentat will continue to work together to ensure timely availability of IPv6 for the Mac OS once the standard has been completed.

Question: Will Open Transport v2.0 for Copland offer any new capabilities?

Answer: Yes. Open Transport v2.0 is being designed to take full advantage of the new microkernel services available in the Copland OS. As a result, Open Transport networking on Copland is planned as a set of multi-threaded, preemptively scheduled tasks running in protected memory.

To a user, this will mean that networking will be even more robust and higher performance. To a developer, this will mean that a rogue application running in another memory space will not be able to corrupt system level networking task.

In addition, Open Transport v2.0 is expected to incorporate a second generation update to the human interface introduced with Open Transport v1.0. Current plans call for this release to include support for features such as:

- Configuration selection will be integrated with system level workspaces and the location assistance toolbox;
- Advanced end-users and network administrators will be able to configure a protocol stack for simultaneous support of multiple network connections (multi-homing);
- Administrators will find additional trouble-shooting tools (such as Ping, trace route, local ARP cache, access to local routing tables, and others) integrated with the configuration utilities;
- Support for AppleScript; and
- Desktop aliases for network configurations to allow double-click reconfiguration of services.

Open Transport 2.0 is also planned to include integrated support for NetWare/IPX, X.25, ATM, and ISDN.

Question: What about the Apple Internet Router, ARA Multiport Server, and LaserWriter Bridge? Will they be revised for Open Transport?

Answer: Apple is not announcing future plans regarding these products at this time.

Question: What about MacSNMP? When will it be revised to work with Open Transport?

Answer: MacSNMP v1.5 is planned to be available in 1996. This release is designed to include support for MIB II statistics from the Open Transport/TCP stack, transport of SNMP data over Open Transport/TCP, and to add support in the Macintosh System MIB for both NuBus and PCI interface cards.

MacSNMP and the Mac System Agent are supported through Open Transport's backward compatibility services.

Open Transport 1.0.8: For More Information Q & A (3/96)

Revised: 3/26/96
Security: Everyone

Open Transport 1.0.8: For More Information Q & A (3/96)

=====

Article Created: 27 October 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on getting more information on Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: How can interested parties get more information on Open Transport?

Answer: Documentation for Open Transport is publicly available by anonymous ftp on the Internet at <ftp://seeding.apple.com/opentransport/>. There you will find release notes, general information (including the latest version of this Q&A), and developer notes from the SDK.

Question: How can interested customers apply to receive pre-release copies of Open Transport for implementation testing?

Answer: The Open Transport Early Access program was announced in March 1995. Based on the overwhelming customer response this program is now enrolled to capacity -- no further applications can be accepted or approved. Alternatively, you should contact your local Apple Computer support representative concerning locally supported seeding programs.

The final Open Transport 1.1 software will be available in the near future.

Question: How can interested developers apply to receive pre-release copies of Open Transport for development and testing?

Answer: The Open Transport developer seeding program has reached over 5,000 developers to date. As the final code for Open Transport 1.1 is nearing completion, Apple will move to make the Open Transport Software Developers Kit (SDK) widely available through electronic information services, including select sites on the Internet. The Open Transport SDK will also be included on the next issue of the Mac OS SDK, available from APDA.

No further pre-release seeding of the Open Transport 1.1 SDK is planned at this time. Following the shipment of version 1.1, a new seeding program is planned for future versions of Open Transport. Details of additional seeding programs will be announced at a later date.

Question: How can developers get support while developing Open Transport applications?

Answer: Open Transport is a strategic and supported technology. Apple Developer Support services have engineering specialists fully trained on Open Transport development and debugging. Access to these engineers is just one of the benefits of the Apple Developer Partner's program.

For more information on Apple's Developer Support services, including information on how to register as an Apple Developer Partner, contact the Macintosh Developer Services Information Line at US 1-408-974-4897.

For developers who are not a part of one of Apple's Developer Support services programs, the Open Transport engineering team has established an email address for general feedback: opentpt@applelink.apple.com. This address is not for technical support, however, nor can all inquiries can be acknowledged.

Question: Are there general reference sources on XTI, STREAMs and DLPI?

Answer: Sources of information that are applicable to XTI and STREAMs include:

- OSF/1 Operating System: Network Applications Programmer's Guide; Open Software Foundation, Prentice Hall, ISBN 0-13-640145-7
- UNIX Network Programming; W. Richard Stevens, Prentice Hall, ISBN 0-13-949876-1
- UNIX System V Release 4: Programmer's Guide: STREAMs; Unix Press (A Prentice Hall title), ISBN - 0-13-020660-1
- Programming UNIX SVR4.2: Network Programming Interfaces; UNIX Press (A Prentice Hall title), ISBN 0-13-017641-9
- X/Open CAE Specification: X/Open Transport Interface (XTI); X/Open Company, Ltd. (XO/CAE/91/600) ISBN 1-872630-29-4

QuickTime Conferencing: Reasons for B&W Self View Image (5/96)

Revised: 5/22/96
Security: Everyone

QuickTime Conferencing: Reasons for B&W Self View Image (5/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 21 May 1996

TOPIC -----

I am using a QuickTime Conferencing Camera 100 with my AV equipped Macintosh computer. I am getting an image but it only appears in black and white. This happens regardless of color depth chosen in the Monitors control panel.

DISCUSSION -----

There are two common reasons why your QuickTime Conferencing Self View window may be showing only in Black and White.

Monitor Size or Screen Resolution Selected

If your screen resolution is set higher than 832x624, your Self View image will appear on your monitor and sent to other conference members in black and white. This happens regardless of how much VRAM you have because the VRAM cannot draw that large of an image and redraw a color Self-View window quickly enough.

Lower your monitor's screen resolution to 832x624 or lower in the Monitors control panel and your Self View image will appear and broadcast in color.

How the Camera is Connected to the Computer

Three cables ship with the QuickTime Conferencing Camera 100:

- A. 1 Combination cable, S-Video to DC Power and RCA jack
- B. RCA to RCA
- C. S-Video to DC Power

You must use the appropriate cable for your computer in order for the QuickTime Conferencing Camera to work correctly.

The output from the QuickTime Conferencing Camera 100 is an NTSC composite signal, not an S-Video component signal. With the exception of the Power Macintosh 7500 and 8500, AV equipped Power Macintosh computers will accept a composite video signal through the S-Video port. The S-Video port also provides 12-volt power to the QuickTime Conferencing Camera. For Power Macintosh AV computers other than the Power Macintosh 7500 and 8500, use cable A to connect the S-Video connector to the computer's S-Video port and the RCA and DC Power pigtail on the other end of the cable to the QuickTime Conferencing Camera.

The Power Macintosh 7500 and 8500 computers cannot receive a composite video signal in their S-Video connectors. Because of this, you need to connect cable B from the RCA jack on the QuickTime Conferencing camera to the RCA jack on the back of the Power Macintosh 7500 or 8500. If you use the S-Video port to deliver the video to the computer, you will see a black and white image. You also need to use cable C to deliver power from the S-Video port on the Power Macintosh 7500 or 8500 to the QuickTime Conferencing camera.

If you have a Macintosh Quadra or Centris 840 AV or 660 AV, there is no S-Video port to supply power to the camera. In addition to using cable B for video, you will need to purchase a 12-volt, 1.9 Watt AC adaptor from your local Apple Dealer or an electronics store.

Begin_Table

Summary Table

=====

Computer	Cable	Video Signal	Camera Power
-----	-----	-----	-----
Quadra/Centris 660/840 AV	B	From Cable B	Separate Power Adaptor
Power Macintosh 6100 AV	A	From Cable A	From Cable A
Power Macintosh 7100 AV	A	From Cable A	From Cable A
Power Macintosh 8100 AV	A	From Cable A	From Cable A
Power Macintosh 7500	B & C	From Cable B	From Cable C
Power Macintosh 8500	B & C	From Cable B	From Cable C

DOS Compatible: CD-ROM Needs to be in Drive at Startup (11/96)

Article Created: 27 October 1995
Article Reviewed/Updated: 18 November 1996

TOPIC -----

I cannot access the CD-ROM from DOS or Windows since I upgraded to version 5.1.1 of CD-ROM Setup on my DOS Compatible Macintosh computer. Everything worked before I did the upgrade and I have not changed anything on the DOS side. What is wrong?

DISCUSSION -----

This issue was present with both CD-ROM Setup versions 5.1.1 and 5.1.2. This issue is resolved with the DOS Compatibility 1.5 software update which is available online or for a shipping and handling fee from Apple.

The DOS Compatibility Software Update is a set of software enhancements that improves the reliability and performance of the following:

- Power Macintosh 6100 DOS Compatible computer
- Macintosh Performa 6100 DOS Compatible computer
- Macintosh Performa 630 and 640CD DOS Compatible computers
- Macintosh LC 630 DOS Compatible computer

This update also works with any Power Macintosh 6100 or Macintosh Performa 6100 series computer that has a DOS Compatibility Card installed.

IMPORTANT: PCI based PC Compatibility cards already ship with the DOS Compatibility 1.5 software and do not need to install this update.

The update is also not intended for the Quadra or Centris 610 DOS Compatible computers. Quadra and Centris 610 DOS Compatible computers will need to continue to use one of the above workarounds.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

18 Nov 1996 - Added resolution information.

PC Exchange: Known SCSI Option Issues (5/96)

Revised: 5/14/96
Security: Everyone

PC Exchange: Known SCSI Option Issues (5/96)

Article Created: 26 October 1995
Article Reviewed/Updated: 14 May 1996

TOPIC -----

I have a Power Macintosh 8500 and a Syquest drive that I use to read DOS formatted Syquest cartridges. Since I have upgraded to the 8500, PC Exchange will not let me select the Syquest drive to access DOS files. The SCSI ID on the Syquest drive is 3. The drive will mount Macintosh cartridges so what is wrong?

DISCUSSION -----

Your Power Macintosh 8500 computer has an internal and external SCSI bus. This allows you to connect up to 12 SCSI devices. You can use the same SCSI ID number twice on the same computer as long as the duplicate SCSI ID numbers are not on the same bus.

In your case, the internal CD-ROM drive is set at SCSI ID 3 at the factory and your Syquest drive on the external bus is also set at SCSI ID number 3. This configuration works fine, however, PC Exchange does not understand multiple SCSI buses and is unable to access the second device with the duplicate SCSI ID on the external bus.

The workaround is to set a SCSI ID for the Syquest drive that is unique to both buses. After doing this, PC Exchange will be able to access the Syquest drive.

On Macintosh computers with more than one SCSI bus, another issue sometimes appears. If you use the internal fast-SCSI bus, PC Exchange show multiple devices for the same device. For example a third-party hard disk may be shown in PC Exchange as ID 0 and 0.1

Apple Engineering is aware of these issues. Multiple bus support will be added to a future version of PC Exchange.

Article Change History:

14 May 1996 - Added fast-SCSI devices showing up with multiple SCSI IDs.

PowerBook 5300 & 190: System SW Custom Install Options (10/95)

Revised: 10/27/95
Security: Everyone

PowerBook 5300 & 190: System SW Custom Install Options (10/95)

Article Created: 27 October 1995

TOPIC -----

This article describes the Custom Install options of the System 7.5.2 installer

DISCUSSION -----

The System 7.5.2 Custom Install for the PowerBook 5300 series and PowerBook 190 series contains some new items and some differences not found with previous System 7.5.x installers.

Some differences:

- If you need to re-install the PC Card extensions there is a custom install option called PC Card Modem Files. This installs the PC Card Modem extension and the PC Card extension in the extensions folder. These extensions are designed by Apple and are required if PC cards are being used in the PowerBook. Many third-party PC Cards will require the additional drivers or other software provided by the vendor of the card.
- There is no custom installation option for MacTCP listed under Control Panels and MacTCP is not part of an Easy Install. To install MacTCP 2.0.6:

Step 1

Launch the Installer, click Continue to get to the Installation Window.

Step 2

Click on the upper left pop-up menu and choose Custom Install. Scroll down to locate the Networking Software section. Click on the triangle next to Networking Software to expand the list.

Step 3

Click in the box next to TCP/IP. Click Install. This places MacTCP 2.0.6, the MacTCP DNR, and MacTCP Prep file in your System Folder.

Here is the entire list of what can be custom installed in System 7.5.2:

TOPIC -----

I want to create watermarks with my LaserWriter printer. Is there a way to do this on the LaserWriter printer?

DISCUSSION -----

There are several ways you can create and use watermarks.

- QuickDraw GX and Peirce Paper Saver
- Third-Party Solutions
- Application level support
- Some StyleWriter printer drivers

As you can see from this list, the LaserWriter 8.3 does not have built-in support for creating or using watermarks.

QuickDraw GX and Peirce Paper Saver

=====

You can use and create watermarks with QuickDraw GX and Peirce Paper Saver. Peirce Software, Inc. in conjunction with Apple Computer, provides a free copy of Peirce Paper Saver and Peirce Watermark. Peirce Paper Saver and Peirce Watermark are QuickDraw GX printing extensions that enhance your printing capabilities when using QuickDraw GX printing and applications that support the new GX printing dialogs. Additional information on installing and using the Peirce Paper Saver extension is available in the Tech Library article titled "QuickDraw GX: Installing Printing Extensions".

Third-party solutions

=====

Software can be used to modify print jobs and add watermarks. One product that

has the ability to do this is Working Watermarker from Working Software, Inc.

Application level support

=====

Microsoft Word 4 and later versions have support for inserting fragments of PostScript code, and formatting them in a special "PostScript" style. There were MacUser articles that outlined how to write fragments that would create watermarks for Word documents.

Certain Apple Inkjet printers

=====

The StyleWriter 1200, Color StyleWriter 2200, and Color StyleWriter 2400 (second release) have printer drivers that support watermark printing.

NOTE:

Color StyleWriter Pro printer driver does not support watermark printing.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Macintosh 630 Series: Using Ethernet CS Cards In Windows (10/95)

Revised: 10/30/95
Security: Everyone

Macintosh 630 Series: Using Ethernet CS Cards In Windows (10/95)

=====

Article Created: 30 October 1995

TOPIC -----

I have a Macintosh 630 series computer with a DOS Compatibility Card installed, and I want to use Ethernet in the Windows/MS-DOS environment. What Communication Slot Ethernet cards allow me to do this?

DISCUSSION -----

Ethernet cards that are designed to use the .ENET driver should work for Windows/MS-DOS networking. Information that passes from the MS-DOS side to the Ethernet card must go through the PC Network Extension, which must be located in the Extensions folder on the Macintosh. Because the PC Network Extension is written to use the .ENET driver, any card that does not use this driver will not work properly from Windows/MS-DOS.

The Apple Ethernet CS cards use the .ENET driver, so they will work properly. Contact other vendors to find out if their Ethernet cards use the .ENET driver.

DOS Compat Card: Sharing Files Between Environments (10/95)

Revised: 10/30/95
Security: Everyone

DOS Compat Card: Sharing Files Between Environments (10/95)

Article Created: 30 October 1995

TOPIC -----

How can I share files between the Macintosh and PC environments of my Macintosh DOS Compatible computer? What steps do I need to take to set this up?

DISCUSSION -----

To transfer files between the Macintosh and PC environments of your Power Macintosh 6100 DOS Compatible computer, follow the steps provided below:

Step 1

Make sure the DOS Compatibility Card Installer Disk for DOS environment has been installed. At the C:\> prompt, enter this command:

MEM /C /P then press return.

This command lists all drivers currently resident in DOS memory. If you see APPLEPC, DOSCLIP, and MACSHARE, then your DOS Compatibility Card Installer Disk for DOS Environment is already installed. If you do not see these modules listed, look for Installing additional PC software in the "DOS Compatibility Card for Macintosh User's Guide."

Step 2

Make sure that you have a LASTDRIVE statement in your CONFIG.SYS file. Have a line somewhere in your CONFIG.SYS file as shown below:

LASTDRIVE=Z

Step 3

Create a new folder in the Macintosh environment, and give it a descriptive name, something like, DOS TRANSFER.

Step 4

Open the PC Setup control panel. Look for the pop-up menu labeled Sharing, and select one of the available DOS drive letters. A dialog box appears, letting you select the folder that you have made for sharing files with the PC environment. If you want the connection to be permanent, select the checkbox labeled Share every time PC is started.

NOTE: An entire volume can be shared in this manner also.

You can now save or read files back and forth between the Macintosh and PC environments. You can save files to the folder created in step 3 from the Macintosh environment and access these files from the PC environment, or the other way around, save files from the PC environment and access these files from the Macintosh environment. For more information on shared folders and volumes, look for Choosing shared folders or volumes in the "DOS Compatibility Card for Macintosh User's Guide."

Apple Video Player: Volume Control Has No Affect On Input 10/95

Revised: 10/31/95
Security: Everyone

Apple Video Player: Volume Control Has No Affect On Input 10/95

=====

Article Created: 31 October 1995

TOPIC -----

I am using Apple Video Player to capture audio and video from a VCR that has very low sound output through its audio channel. Regardless of how high I set the volume control in Apple Video Player during recording, when I playback the captured video, the audio is still too low. What can I do to increase the audio portion of the movie?

DISCUSSION -----

The Apple Video Player application does not have a feature for increasing audio input volume or gain. You need to use an application, like Avid's VideoShop or VideoFusion, that allows you to increase the gain from the source you are capturing. If you are capturing from an external device like a VCR or LaserDisc player, you can also route the audio/video signal through a mixer to increase the gain before the signal enters the computer.

Power Macintosh 8500: Screen Resolution Set Too Low (2/96)

Revised: 2/7/96
Security: Everyone

Power Macintosh 8500: Screen Resolution Set Too Low (2/96)

Article Created: 31 October 1995
Article Reviewed/Updated: 5 February 1996

TOPIC -----

I am using a television as my monitor for my Power Macintosh 8500. I set the screen resolution to 256x192 and now when I try to reopen the Sound & Displays Control Panel, I get a message saying that the screen is too small to display this window and it closes. I tried resetting the parameter RAM (PRAM), but the small resolution remains. How can I set my monitor resolution back to normal when I cannot access the Sound & Displays control panel?

DISCUSSION -----

When the Power Macintosh 8500 is using a television as its only display, The Sound & Displays control panel offers screen resolution options of 640x480, 512x384, 320x240, and 256x192. At the 256x192 resolution, you are not able to reopen the Sound & Displays control panel to return to a larger screen size. Resetting the PRAM will not return the resolution to a standard setting either.

The way to set your monitor back to a larger screen size is to use the Control Strip software that comes with the Power Macintosh 8500. Use the Resolution Control Strip module (the second module from the left) to switch to a larger screen resolution.

If you have removed the Control Strip software or cannot see the Control Strip, you can follow these steps to reset the display settings:

Step 1

Zap PRAM by holding down the Command-Option-P-R keys simultaneously from a cold startup (that is, you must turn off or shutdown the computer, then turn it back on again; you cannot choose Restart from the Special menu).

Step 2

After the second startup sound, release all of the keys and startup with the extensions off by holding down the Shift key until you see the message that says "Welcome to Macintosh Extensions Off". Then you can release the Shift key.

Step 3

Once the computer has started up, go to the Preferences Folder, which is inside the System Folder, and throw away the Display Preferences file.

Article Change History:

05 Feb 1996 - Added additional resolution.

01 Nov 1995 - Clarified fix.

ISDN Line Ordering and Configuration Parameters (3/96)

Revised: 3/6/96
Security: Everyone

ISDN Line Ordering and Configuration Parameters (3/96)

Article Created: 30 October 1995
Article Reviewed/Updated: 6 March 1996

TOPIC -----

This article describes ISDN ordering and configuration parameters for QuickTime Conferencing H.320/ISDN products when used with United States telephone lines.

DISCUSSION -----

This is a summary of the types of ISDN lines supported by phone companies. All Apple QuickTime Conferencing H.320/ISDN products work with all ISDN switch types (AT&T, Northern Telecom, and Siemens). The ISDN lines offered by your telephone company may differ from region to region. If you are given the choice of line types, order the National ISDN-1 or NI-1 configuration.

Follow the guidelines below when ordering the specific type of line you choose. You may want to copy the guidelines and fax them to your ISDN service provider to expedite the ordering process.

Begin_Table

National ISDN-1 (NI-1)

Service Type:

- Choose Circuit-Switched Data (CSD) on the first B-channel.
- Choose Circuit-Switched Data/Voice (CSD/V) on the second B-channel.

Maximum Number Of B Channels:	2
TEI Assignment:	Dynamic
Packet Mode:	No
Number Of Call Appearances:	1 if you choose CSD/V; otherwise none
Terminal Type:	A (basic call terminal)
Protocol Version Control (PVC):	2 (on Northern Telecom lines only)

EKTS:	No requirement
Service Profile Identification	
Numbers (SPIDs):	2 (one per B-channel)

Make sure you receive the correct Service Profile Identification Numbers (SPIDs) with your ISDN line. Also make sure your ISDN provider informs you which B Channel has voice capabilities.

Optional: Order Call Forwarding Busy for both B channels if you have ordered an ISDN line with 2 Directory (Telephone) Numbers. This will forward a call to an open B channel if the called B channel is in us.

NOTE: For 5ESS National Internet (NI-1) lines it is possible to order a NI-1 ISDN line with only one Directory Number. This circumvents the issue of having to forward calls to an unused B channel. For Northern Telecom DMS-100 ISDN lines (both NI-1 and Custom) you must have two Directory Numbers, therefore the call forwarding option is desired.

AT&T Custom 5ESS (5E6, 5E7, 5E8, and 5E9)

Service Type:

- Choose Circuit-Switched Data (CSD) on the first B-channel.
- Choose Circuit-Switched Data/Voice (CSD/V) on the second B-channel.

Maximum Number Of B Channels:	2
Line Configuration:	Point-to-point
TEI Assignment:	Dynamic
Packet Mode:	No
Number Of Call Appearances:	1 if you choose CSD/V; otherwise none
Terminal Type:	D if you choose CSD/V; otherwise A (basic call terminal)
Bearer Service Restrictions:	None (DMD on both channels)
EKTS:	No requirement
One Touch:	No
Auto-Hold:	No

NOTE: The information in this section is for custom 5ESS lines only. If you can order a 5ESS line that is configured to the National ISDN-1 standard, please refer to the guidelines for setting up a National ISDN-1 line above.

Northern Telecom DMS Custom (With BCS-33 Through BCS-36)

Service Type:

- Choose Circuit-Switched Data (CSD) on the first B-channel.
- Choose Circuit-Switched Data/Voice (CSD/V) on the second B-channel.

Telephone Numbers:	2 (with SPIDs)
--------------------	----------------

TEI Assignment:	Dynamic
Terminal Type:	A (basic call terminal)
Bearer Service Restrictions:	None
Ringer Indicator:	Yes
EKTS:	No requirement
Authorized Call Types:	CMD
MXK:	Not applicable, or default

Make sure you receive the correct Service Profile Identification Numbers (SPIDs) with your ISDN line. Also make sure your ISDN provider informs you which B Channel has voice capabilities.

Personal LW NTR: Multipurpose Tray & Legal Paper (11/95)

Revised: 11/1/95
Security: Everyone

Personal LW NTR: Multipurpose Tray & Legal Paper (11/95)

=====

Article Created: 1 November 1995

TOPIC -----

I want to print on legal paper with my Personal LaserWriter NTR using the multipurpose tray. I do not have any cassette feeders and I want to use the LaserWriter 8 driver's auto tray selection function, can I do this?

DISCUSSION -----

After you setup the Personal LaserWriter NTR with the LaserWriter 8 driver in the Chooser, you will be offered four paper source selections:

Auto Select
Multipurpose Tray
Paper Cassette (grayed out)
Manual Feed

To print legal size paper from a Personal LaserWriter NTR and multipurpose tray with the LaserWriter 8 driver, you will have to select Multipurpose Tray every time from the pop-up menu in the Print dialog. The print driver does not retain your last paper source selection.

With US Legal selected from the Page Setup command in the File menu, and Multipurpose Tray or Manual Feed chosen in the Print dialog, a US Legal page will print correctly. However, if Auto Select is chosen in the Print dialog, the printer will center the bottom of the legal sized image to fit on a US Letter size page. This will cause the top 3-inches to be cut off.

With Auto Select chosen, the LaserWriter NTR assumes the paper size in the tray to be US Letter. Unfortunately, the printer cannot be configured with LaserWriter Utility or Apple Printer Utility to know that a Multipurpose Tray or Manual Feed selection has legal size paper.

Power Macintosh 7200 Series: Frequently Asked Questions (1/97)

Revised: 2/3/97
Security: Everyone

Power Macintosh 7200 Series: Frequently Asked Questions (1/97)

=====

Article Created: 30 October 1995
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Power Macintosh 7200 series computers.

Questions answered in this FAQ:

- 1) What is the difference between native software, conventional software, and "Fat" software?
- 2) What causes Type 11 errors?
- 3) What causes Type 10 errors?
- 4) Does my Power Macintosh have an FPU (Floating Point Unit/Math coprocessor)? I see errors that an FPU is not installed.
- 5) I need to run DOS software on my Power Macintosh 7200 series computer. What are my options?
- 6) I have an old program which tells me to turn off 32-bit addressing. But I do not see this as an option in my Memory control panel. Why?
- 7) How can I get the built-in Ethernet address for my computer?
- 8) Can I add level-2 processor cache to my computer? Is it a SIMM or DIMM?
- 9) Can I add Video RAM (VRAM) to my computer?
- 10) I started my Power Macintosh computer from the startup CD but Disk First Aid says "files are open." How can I close those files?

- 11) I have an old program that requires less than 256 colors to be on. But the Monitors control panel settings don't show anything less than 256. What can I do?
- 12) At startup time, my monitor flashes off and back on again. Why?
- 13) I have a CD-ROM that said to install the Apple Multimedia Tuner. Do I need this on my Power Macintosh 7200?
- 14) I have a GeoPort Telecom Adapter. What version of the Apple Telecom software should I use?
- 15) I can't see a restart button on the computer. What do I use to restart my Power Macintosh 7200 if the screen is frozen?
- 16) I am trying to connect to my internet service provider (ISP) using SLIP/PPP software. What do I need to know?
- 17) Can NuBus cards be used with these Power Macintosh computers?
- 18) Is there an upgrade available for the Power Macintosh 7200 series computers?
- 19) Where can I find the latest Apple software updates online?

DISCUSSION -----

1) Question: What is the difference between native software, conventional software, and "Fat" software?

Answer: The Power Macintosh runs in two modes, without any further assistance from the user: it can run "native" software, which is software written for the PowerPC chip, or "conventional" software, which is software written for an older 68000, 68020, 68030, or 68040-based computer. Conventional software is sometimes referred to as "68K" software.

Conventional software runs in an "emulation" mode, which is functionally similar to the 68LC040 processor. Conventional software will generally give between Macintosh IIci and Quadra 605 performance, depending on how many references the software makes to the native "toolbox" in the computer. Conventional extensions and control panels may rewrite native parts of the system software causing slower performance.

Native software runs only on Power Macintosh computers. It has been rewritten to be aware of and to take advantage of the PowerPC chip inside of all Power Macintosh computers.

"Fat" applications are programs that can be run on either a 68K or Power Macintosh computer without modification. The operating system automatically determines which part to use.

Since "Fat" applications are really two programs in one, many installers will offer either a "Power Macintosh" or "Conventional" install. If you have

installed a software billing itself as "Accelerated for Power Macintosh" and, once installed, it does not recognize features which definitely exist, such as an FPU, make sure you have installed the correct version and build. Both versions will run on the Power Macintosh, but only the "native" version will benefit from all the special features of the Power Macintosh.

2) Question: What causes Type 11 errors?

Answer: Type 11 errors are typically due to one of a variety of factors:

- Font problems: you are using a bad font.
- Incompatible software running in emulation.
- SCSI chain problems: bad driver or cable.
- Cache SIMM problems (if you have installed one on your Power Macintosh computer).
- RAM problems: bad RAM has been installed.

For steps on how to troubleshoot such problems, see the referenced article in the online Apple Technical Info Library (on the Internet at <http://til.info.apple.com/>)

- Use the search string "type 11 power" to locate the article "Power Macintosh: Meaning of Error Type 11."
- Use the search string "sys7 extension troubleshoot" to locate the article "Troubleshooting Macintosh System 7 INIT Conflicts"

3) Question: Does my Power Macintosh have an FPU (Floating Point Unit/Math coprocessor)? I see errors that an FPU is not installed.

Answer: All PowerPC processor chips, which all Power Macintosh computers use, have an integrated FPU. You may be seeing the "FPU not installed" error for two reasons:

- You are running "conventional" software in 68K emulation. This operating mode does not provide access to the computer's floating point unit. Thus, the program does not work. See if there is an upgrade to a PowerPC native version of the program. Certain software "bridges" exist to allow conventional software access to the PowerPC microprocessor's FPU. See the Redgate Communications area to search for such products.
- You are using software, in either emulation or native mode, which is simply failing. Since the PowerPC supports pipelining instructions, a number of errors are occurring simultaneously. They eventually percolate out as an "FPU not installed" error. An error did occur, but it has nothing whatsoever to do with the need for a floating point unit. You should apply standard troubleshooting steps to resolve this issue. Standard troubleshooting information can be found in the online Apple Tech Info Library.

4) Question: What causes Type 10 errors?

Answer: A Type 10 error seen on a Power Macintosh 7200 series computer is going

to occur under the same circumstances as an FPU error. Due to the changes and enhancements in the 680x0 emulator, there are instances where an FPU error will be returned as a type 10 error. Follow the same troubleshooting steps you would when troubleshooting an FPU error.

5) Question: I need to run DOS software on my Power Macintosh 7200 series computer. What are my options?

Answer: With a Power Macintosh 7200 series computer, there are several ways to accomplish this.

- Apple offers two PC Compatibility cards featuring either a Pentium 100-megahertz processor on a 12-inch card (M4092LL/A) or a 586 100-megahertz processor on a 7-inch card (M4091LL/A). These PC Compatibility Cards let you run MS-DOS and Windows applications directly on your Power Macintosh computer. You can switch instantly between Mac OS, Windows, and MS-DOS environments with a single keystroke.

- Orange Micro has announced a version of their Orange PC card for PCI based Power Macintosh computers. The Orange PC cards use an expansion slot inside of your Power Macintosh 7200 series computer. You can get more information by contacting Orange Micro directly. Their phone number is 714-779-2772.

- Reply, Inc. has also announced a version of their DOS on Mac card for PCI based Power Macintosh computers. The Reply cards use an expansion slot inside of your Power Macintosh 7200 series computer. You can get more information by contacting Reply directly. Their phone number is 800-801-6898.

- You can use Insignia Solutions' SoftWindows emulator. This is a Macintosh application which emulates a PC DOS/Windows environment. You can get more information, such as pricing, performance, system requirements, and compatibility information from Insignia by calling them at 800-848-7677.

6) Question: I have an old program which tells me to turn off 32-bit addressing. But I do not see this as an option in my Memory control panel. Why?

Answer: All Power Macintosh computers run only in 32-bit memory addressing mode. There is no way to turn this off. Check with the vendor for a 32-bit compatible version of the software.

7) Question: How can I get the built-in Ethernet address for my computer?

Answer: The Apple LAN Utility version 1.0b4e1 can obtain the built-in Ethernet address in the Power Macintosh 7200 series computer. While this utility is not supported by Apple, it is available in the Apple Software Updates area of the online services we post to (path: Macintosh -> Unsupported -> Apple LAN Utility 1.0b4e1)

With System 7.5.3 and the included Open Transport networking software 1.1, you can also determine the Ethernet address in either the TCP/IP or the AppleTalk

control panels. The following steps apply to either control panel.

Step 1

Open either the AppleTalk or TCP/IP control panel.

Step 2

Choose User Mode from under the Edit menu. Click once on Advanced and click Okay.

Step 3

Click on the Info button at the bottom of the AppleTalk or TCP/IP window. The built-in Ethernet address is listed as the Hardware Address and is in Hexadecimal format.

8) Question: Can I add level-2 processor cache to my computer? Is it a SIMM or DIMM?

Answer: You can add a level-2 processor cache to the Power Macintosh 7200 series computers. The cache is a 160 pin DIMM (dual in-line memory module). You can contact an Apple-authorized service provider for ordering information and installation.

9) Question: Can I add Video RAM (VRAM) to my computer?

Answer: You can increase your VRAM to 2 MB or 4 MB from the 1 MB it originally shipped with. The VRAM DIMMs must be 1 MB, 112-pin fast-paged mode, with 70 ns RAM access time or faster. Do not use 256K VRAM SIMMs. If you increase the VRAM to 2 MB, make sure the DIMM is added to the first VRAM slot. You can contact an Apple-authorized service provider for ordering information and installation.

Note also that adding VRAM will increase overall graphic performance on the Power Macintosh 7200 series computers because the bus is increased from a 32-bit wide bus to 64-bit wide bus with the additional VRAM.

10) Question: I started my Power Macintosh computer from the startup CD but Disk First Aid says "files are open" and won't allow me to click on repair. How can I close those files and repair the directory?

Answer: Virtual memory is active when started from the Power Macintosh CD. Here are two ways to disable Virtual memory.

Step 1

Insert the CD into the computer. Open the Startup Disk control panel and select the Power Macintosh CD. Restart the computer and push and hold down the Shift key. Release the Shift key when you see the Extensions Off message at the Welcome to Macintosh screen. Virtual memory is now off and Disk First Aid should be able to attempt repairs.

Step 2

Start the computer with the Power Macintosh CD in the drive and hold the letter C down. When you see the Macintosh face on the screen, immediately release the letter C and push and hold down the Shift key. Release shift when you see the Extensions off message at the Welcome to Macintosh screen.

11) Question: I have an old program that requires less than 256 colors to be on. But the Monitors control panel settings don't show anything less than 256. What can I do?

Answer: The built in video will not support less than 256 colors or greys. If you have a program that requires black and white, 4, or 16 colors to run, then you will not be able to run these programs. Check with the software vendor for availability of a compatible version. You could also check with video card vendors to see if any offer support for less than 256 colors.

12) Question: At startup time, my monitor flashes off and back on again. Why?

Answer: The software video driver for the monitor is loading up. This is normal and is answered in the Power Macintosh 7200/9500 Read Me file.

13) Question: I have a CD-ROM that said to install the Apple Multimedia Tuner. Do I need this on my Power Macintosh 7200?

Answer: The Power Macintosh 7200 series computers originally shipped with QuickTime 2.0. and will benefit from the Tuner. If you have installed QuickTime 2.1, then you do not need to install the Apple Multimedia Tuner. Check the version of QuickTime installed to determine if you need the Tuner. We would recommend upgrading to QuickTime 2.1 which incorporates the Tuner. QuickTime 2.1 is available in the Apple Software Updates area (Path: Macintosh -> System Software -> Other System Software -> QuickTime 2.1)

Additionally, if you are using System 7.5.3, then you do not have to upgrade because QuickTime 2.1 is included.

14) Question: I have a GeoPort Telecom Adapter. What version of the Apple Telecom software should I use?

Answer: You should use at least the Apple Telecom 2.1 that is in the Apple Telecom folder inside of the Apple Extras folder on your hard drive (and on your backup CD if you have removed it). Megaphone 1.0.2 is also provided in this folder. The current Apple Telecom 2.3 is compatible, but adds no additional functionality for the Power Macintosh 7200 series computers.

15) Question: I cannot see a restart button on the computer. What do I use to restart my Power Macintosh 7200 if the screen is frozen?

Answer: The reset command is a keyboard shortcut identical to the Macintosh Quadra 605 and Macintosh LC computers. The key combination is

Command-Control-Power. In addition to the keyboard power button, the Power Macintosh 7200 series computers also have a power button on the bottom front left panel (below the speaker panel).

If these do not restart or shut down the computer, it may be necessary to disconnect the power from your Macintosh computer. This can be done by turning off the power strip or by disconnecting the cable from the outlet or the back of the computer.

16) Question: I am trying to connect to my internet service provider (ISP) using SLIP/PPP software. What do I need to know?

Answer: Check the Open Transport FAQ for more detailed information. Make sure you have at least Open Transport 1.0.7 (1.0.6 is what originally came with your Power Macintosh 7200 series computer). Version 1.1 is the current version and is included with System 7.5.3. Computers with Mac OS 7.5.2 can update to 7.5.3 by installing the System 7.5 Update 2.0. The system update is available online or from the Apple Order Center at 1-800-293-6617, ext. 984 for a \$13 shipping and handling fee. Both updates are available in the Apple Software Updates area on the online services to which Apple posts its software.

Also make sure you are using the TCP/IP control panel and not trying to get MacTCP to work. MacTCP is not compatible with the Power Macintosh 7200 series computers.

17) Question: Can NuBus cards be used with these Power Macintosh computers?

Answer: NuBus cards cannot be used in this Power Macintosh. However, to preserve your investment in NuBus technology, a NuBus expansion chassis for PCI will be available from Second Wave, Inc. This chassis will enable you to continue to use your existing NuBus cards in Power Macintosh systems with PCI slots.

18) Question: Is there an upgrade available for the Power Macintosh 7200 series computers?

Answer: The Power Macintosh 7200 series computers can currently be upgraded to a Power Macintosh 7600/120 or a 7600/132. See Technical Information Library article titled "Pwr Mac Processor Crds & Logic Brd Upgrades: Descriptions" for more detailed information or contact your local Apple-authorized service provider.

19) Where can I find the latest Apple software updates online?

- On the Internet at the following sites:
 - Worldwide Web: <http://www.info.apple.com/swupdates>
 - ftp: <ftp://ftp.info.apple.com/>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Article Change History:

31 Jan 1997 - Updated ftp references.

20 Jan 1997 - Updated online references.

06 Jun 1996 - Updated tech info and added additional question.

PowerBook 5300 & 2300: Is Speech Recognition Supported? (8/96)

Revised: 8/14/96
Security: Everyone

PowerBook 5300 & 2300: Is Speech Recognition Supported? (8/96)

Article Created: 1 November 1995
Article Reviewed/Updated: 14 August 1996

TOPIC -----

Can I use PlainTalk Speech Recognition or Text-to-Speech software on my PowerBook 5300 or 2300c?

DISCUSSION -----

PlainTalk
=====

PlainTalk Speech Recognition will work with a PowerBook 5300 or 2300 series computer if you install PlainTalk version 1.4.1 and the English Speech Recognition system extension version 1.5.

NOTE: You can only use Speech Recognition with the built-in microphone of the PowerBook 5300 and 2300 series, not with an external microphone. Speech Recognition cannot be used with a PowerBook 2300 series computer in a Duo docking station because the dock does not support 16-bit sound.

Follow these steps to install PlainTalk:

Step 1

Download the PlainTalk software from the Web at the following URL:

<http://speech.apple.com/speech/ptk/ptk.html>

Step 2

Install PlainTalk 1.4.1 (English Speech Recognition and Text-to-Speech).

Step 3

Replace the Speech Recognition extension 1.4.1 with version 1.5.

Text-to-Speech

=====

Text-to-Speech is bundled with PowerBook 5300 series computers and is supported.

This article was published in the Information Alley on 14 August 1996.

CD-ROM Setup 5.1.2: Read Me File (11/95)

Revised: 11/1/95
Security: Everyone

CD-ROM Setup 5.1.2: Read Me File (11/95)

Article Created: 1 November 1995

TOPIC -----

This article contains the ReadMe file included with CD-ROM Setup 5.1.2 posted online.

DISCUSSION -----

About Apple CD-ROM version 5.1.2

=====

This file includes important information about Apple CD-ROM version 5.1.2, software that lets you use an Apple CD-ROM drive with your Macintosh computer. You need system software version 7.1 or later to use this software. Because this information is not included in the documentation accompanying the product, you may want to print it. To do so, choose Print from the File menu.

Installation Instructions

IMPORTANT The full instructions below assume you have an Apple CD-ROM installation disk. If, instead, you're downloading the Apple CD-ROM software from an online service, follow step 1, below. Next, copy the software onto your hard disk and double-click the Installer icon to start the Installer. Then follow steps 5 through 9.

To install this extension, follow these steps:

Step 1

While holding down the Shift key, choose Restart from the Special menu and continue to hold until you see a message. When a message on the screen tells you that the extensions are off, release the Shift key.

When you restart the Macintosh after you install Apple CD-ROM version 5.1.2, the extensions will turn on again.

Step 2

Make sure the Apple CD-ROM installation disk is locked.

Step 3

Insert the Apple CD-ROM installation disk into a disk drive.

If you can't see the Installer icon, double-click the disk icon to open it.

Step 4

To start the Installer program, double-click its icon.

Step 5

In the Welcome dialog box that appears, click Continue.

After a moment, the Install dialog box appears.

IMPORTANT When you started the Installer, it checked to make sure you have what you need to use the software. If you're missing anything, you'll now see a message that tells you what you need. You won't be able to install the software until you correct the problem. If a dialog box says you don't have the correct system software, you can purchase a new version of system software from an Apple-authorized dealer.

Step 6

Make sure the disk named in the Destination Disk box is the one on which you want to install the software. If it's not, click Switch Disk until the correct disk name appears.

Step 7

Click the Install button.

The Installer takes a few moments to calculate what needs to be done and then begins to install files.

Step 8

Follow the instructions on the screen until the installation is complete.

Step 9

When you see a message reporting that installation was successful, click Restart to restart your Macintosh.

The Apple CD-ROM software is now installed on the hard disk.

Improvements to Version 5.1

If you have an Apple CD-600 drive and were using Apple CD-ROM version 5.1, you may have had intermittent problems playing the Peter and the Wolf CD. In version 5.1.2, this problem has been corrected.

Previously a Photo CD with more than 30 sessions would not start up properly. Now a Photo CD of up to 50 sessions (the theoretical maximum number of sessions on a Photo CD) will start properly.

ARPLE CD: How To Perform Manual Install (11/95)

Revised: 11/2/95
Security: Everyone

ARPLE CD: How To Perform Manual Install (11/95)

Article Created: 2 November 1995

TOPIC -----

I am experiencing difficulty with the installation of the new Apple Reference, Performance, & Learning Expert (ARPLE) CD, October '95 Provider Edition. Each time that I try to run the ARPLE II HD Installer, the installer provides a "unsuccessfully installed" message.

I have tried two different ARPLE CDs (both October), on three different computers (Macintosh Workgroup Server 8150, Quadra 840AV, Quadra 800 with PowerPC card all with system 7.5.1), with the same non-results.

DISCUSSION -----

You may be experiencing an installer issue where the Apple Media Tool preferences file is not being installed properly. You could try restarting with all of extensions off, except your CD-ROM extension, before attempting to run the installer or you could try a manual installation.

The following instructions describe how to perform a manual installation:

Manual Installation Instructions

If you have difficulty using the ARPLE Installer, follow the directions below for manual installation.

Step 1

Create a folder named, ARPLE II Internal Folder on your hard drive.

Step 2

Open the folder on the CD named, ARPLE II Folder and copy all of the files except PMedia and Preferences to the new folder on your hard drive.

Step 3

In the ARPLE II Folder on the CD, open the folder named, Preferences and drag the complete folder named ARPLE to the preferences folder in your System Folder.

Step 4

To launch the ARPLE interface from your hard drive open the ARPLE II Internal folder and double click on the ARPLE II application icon.

Quadra 800, 900 & 950: Frequently Asked Questions (11/95)

Revised: 11/2/95
Security: Everyone

Quadra 800, 900 & 950: Frequently Asked Questions (11/95)

=====

Article Created: 2 November 1995

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) about high end Quadra computers, including the Macintosh Quadra 800, 900 and 950.

Questions in this FAQ

- 1) What is an enabler and do I need one?
- 2) What are the expansion options for the high end Macintosh Quadra computers?
- 3) How do I upgrade the memory on my Macintosh Quadra 800, 900, or 950 computer?
- 4) What is an FPU, and does my computer have one?
- 5) What is 32-bit addressing and when does it need to be active?
- 6) What is "resetting the PRAM"? Do I need to do this often?
- 7) Rebuilding the desktop file; what is it and why would I need to do it?

DISCUSSION -----

- 1) Question: What is an enabler and why do I need one?

Answer: Rather than create a new version of the system software each time a new computer is released, Apple Computer created the system enabler. These enablers contain system software code specific to a particular Macintosh computer. Enablers provide older system software with the information necessary to properly run on a newly released Macintosh.

The Macintosh Quadra 800, 900 and 950 computers do not require an enabler when using System 7.5 or later.

The Macintosh Quadra 900 and 950 computers do not require an enabler when using System 7.1.

If you are using System 7.1 on a Quadra 800, you will require System Enabler 040.

2) Question: What are the expansion options for the high end Macintosh Quadra computers?

Answer: On the high end Macintosh Quadra computers, Apple provided several expansion options such as a processor-direct slot (PDS), as well as NuBus slots on each of these computers.

The PDS allows expansion cards to have direct access to the processor. Numerous PDS cards are available; video, network and accelerator cards have implemented a PDS design

NOTE: Because different Macintosh computers use different processors, there are several implementations of the processor-direct slot. Not all PDS cards are compatible with the different PDS types. To ensure compatibility, contact the manufacturer of the PDS card.

NuBus is a standard designed by Texas Instruments. It features self-configuration and bus-mastering on a 32 data-bit card. Bus-mastering means a card can take control of the bus, which allows for multi-processor computing. The card self configures using on-board ROM (Read Only Memory).

The card slot is a one-piece socket connector with two rows for pins. The card has a plug connector with pins that plug into the socket. This slot type is not compatible with any other slot standard.

Here are the expansion slots available on the Macintosh Quadra 800, 900 and 950 computers:

- Macintosh Quadra 800:

Support for two internal SCSI devices, such as a CD-ROM, DAT drive, or SCSI hard disk drive (several capacities available). Three internal NuBus expansion slots. One 68040 PDS provides access to the CPU for highest possible performance.

- Macintosh Quadra 900:

Support for up to three internal SCSI devices, such as a CD-ROM, DAT drive, or SCSI hard disk drive (several capacities available). Five internal NuBus expansion slots. One 68040 PDS provides access to the CPU for highest-possible performance.

- Macintosh Quadra 950:

Support for four internal SCSI devices, such as a CD-ROM, DAT drive, or SCSI hard disk drive (several capacities available). Five internal NuBus expansion slots. One 68040 PDS provides access to the CPU for highest possible performance.

3) Question: How do I upgrade the memory on my Macintosh Quadra 800, 900, or 950 computer?

Answer:

Begin_Table

System	RAM Soldered on Board	Number of SIMM Slots	Possible SIMM Sizes	Physical RAM Configs(MB)	Speed	Notes
Quadra 800*	8	4	4MB,8MB,16MB, 32MB	8,12,16,20, 24,28,32,36,40, 44,48,52,56,60, 64,68,72,76,80, 84,88,92,96,104, 108,112,120,136	60ns	3,11, 12,13
Quadra 900*	0	16	1MB,4MB	4,8,12,16,20 24,28,32,36 40,48,52,64	80ns	3
Quadra 950	0	16	1MB,4MB	4,8,12,16,20 24,28,32,36 40,48,52,64	80ns	3

* Product no longer being produced by Apple.

End_Table

NOTES:

3. These systems have 32-bit-clean ROMs. Computers with 32-bit-clean ROMs can take advantage of more than 8MB of physical RAM under System 7.

11. These systems use 32-bit wide, 72-pin SIMMs (fast-paged mode) not previously used in Macintosh computers.

12. The Centris 650, and Quadra 800 use "memory interleaving" which occurs when SIMM pairs are used (for example: two 8MB SIMMs). This allows the memory subsystem to perform certain operations faster. Basically, it allows the memory subsystem to write to the same memory address in different banks of memory before incrementing the address. Depending on how memory intensive the application, this can improve performance 5 to 10%.

13. The Centris/Quadra 610, Centris/Quadra 650, and Quadra 800 have flexible memory systems, meaning that any supported SIMM size can go into any SIMM socket in any order, and they can run with partially populated banks. They don't support 1MB, 2MB, or 64MB 72-pin SIMMs.

4) Question: What is an FPU, and does my computer have one?

Answer: Floating-point Units (FPUs or math coprocessors), such as the 68881/68882, offer the greatest benefit in applications that tend to be very floating-point (arithmetic) intensive. The specific types of applications that benefit most from an FPU are those that process large amounts of floating-point instructions for precision, and will utilize an FPU extensively. Examples are CAD/CAM, 3-D modeling, scientific applications, and financial applications.

The Macintosh Quadra 800, 900 and 950 computers have a built in Floating Point Unit (FPU).

5) Question: What is 32-bit addressing and when does it need to be active?

Answer: With 32-bit addressing, you can install and access more than 8 MB of physical RAM in your Macintosh. This means you can work with very large data files, very large applications, or many applications concurrently. 32-bit addressing is most attractive to Macintosh users working with large memory-intensive problems. While virtually anyone can benefit from the large amount of memory offered by 32-bit addressing, it will immediately benefit database users, color-graphic users, CAD/CAM users, and programmers.

More technically speaking, 32-bit addressing lets most recent Macintosh models access the entire memory range of the microprocessor.

32-bit addressing is fully implemented in the Macintosh Quadra series. If more than 8 MB of RAM is installed, 32-bit addressing should be active in the Memory control panel. If, for example, 16 MB of RAM is installed on a Macintosh Quadra 800 and 32-bit addressing is off in the Memory control panel, the system software will appear to take up most of the available memory. The solution is to activate 32-bit addressing in the Memory control panel.

6) Question: What is "resetting the PRAM"? Do I need to do this often?

Answer: Parameter RAM (PRAM) is used to keep settings for a Macintosh. PRAM keeps track of the date, time, status of serial ports, which printer has been chosen in the Chooser and numerous other settings.

Occasionally, a corrupt setting in PRAM can adversely affect the operation of the computer. Resetting PRAM can sometimes solve these problems.

It is not a requirement to reset PRAM on a regular, or scheduled basis.

To reset PRAM, restart the computer, press and hold the Command, Option, P and R keys simultaneously. Continue to press these keys until you hear the computer's startup chime the second time.

7) Question: Rebuilding the desktop file; what is it and why would I need to do it?

Answer: The Desktop file is an invisible file in the main level of your hard

drive. It is the file that keeps track of all the documents and applications that are on your drive.

For System 6 and earlier the file name is desktop. System 7.0 and later the invisible files are named Desktop DB and Desktop DF.

Occasionally your Desktop file may become too large or may be damaged.

A symptom of a damaged Desktop file is when icons on your desktop appear as "generic" rather than "custom" icons. Rebuilding the Desktop file may eliminate the problem.

The Desktop file manages all icons on a particular hard drive or floppy disk. When you insert a new or customized icon, the Desktop file may not load it or may load a previous version of the icon. To have the special icon appear on the desktop, the Desktop file must be rebuilt to update the Desktop file and register the icon.

Icons change to generic document (blank page with a corner turned down) or application (diamond with a hand) icons for several reasons, including the following:

- Utilities such as compression or security software can alter icons.
- Custom icons become damaged or deleted.
- The Desktop file has been damaged.
- Applications that create files may not assign icons to the files.
- An application that created a file and assigned an icon may no longer be available.
- A file may have lost the bit that indicates a custom icon (this is known as the bundle bit).

If the Desktop file becomes too large, the computer may have difficulty reading it efficiently and speedily. This can cause the Finder to access files more slowly. Rebuilding the Desktop file can clean up old information and speed up Finder access.

You can also make a file-by-file backup of the drive, re-initialize the drive, and then restore the files. This re-groups all the files, de-fragments them, and increases the efficiency of the drive.

To rebuild the desktop using System 7

Follow these steps:

1. Press and hold the Shift key down while starting up the computer.
2. As soon as you see "Welcome to Macintosh Extensions Off", release the Shift key, and press and hold the Command and Option keys.
3. Continue pressing the Command and Option keys until you see a dialog that says "Are you sure you want to rebuild your desktop on your disk? All of your info window comments will be lost," release the keys and click the OK button.

After the desktop has been rebuilt, restart the computer, and all extensions and control panels will be active again.

To rebuild the desktop using System 7.5 or later

Follow these steps:

1. Before you rebuild your desktop, use the Extensions Manager control panel to save a record of the extensions that are currently turned on.
 - Open the Extensions Manager control pane.
 - Open the Sets pop-up menu, and choose Save Set.
 - When the Save Set dialog box opens, type a name for your currently selected extensions (for example, My Extensions). When you close the dialog box, the name of your set is added to the Sets pop-up menu.
2. To turn off all extensions, open the Sets pop-up menu again and choose All Off.
3. To turn on Macintosh Easy Open, find it on the list and click it to put a checkmark beside it.
4. To rebuild the desktop, restart your computer while pressing and holding the Command and Option keys.
5. When you see the dialog that says "Are you sure you want to rebuild your desktop on your disk? All of your info window comments will be lost," release the keys and click the OK button.
6. When the desktop is rebuilt, open the Apple menu and choose Control Panels.
7. Open the Extensions Manager control panel.
8. To turn your extensions back on, open the Sets pop-up menu and choose the name you gave your set of extensions in step 1 (for example, 'My Extensions').
9. Restart your computer to activate the extensions.

CLW 12/600 PS: Config RPRINTER on Netware 3.1.x (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Config RPRINTER on Netware 3.1.x (10/96)

Article Created: 2 November 1995
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article provides the documentation for setting up a Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printer in RPRINTER mode on a Netware 3.12 server. This information is not in the printer User Manual.

DISCUSSION -----

Step 1 - Apple Printer Utility
=====

- 1) From a Macintosh Launch Apple Printer Utility
- 2) Make sure that RPRINTER is selected
- 3) Enter a name into the Remote PSERVER name
Note: Write down the Remote PSERVER name for later
- 4) Select Port configuration, ensure that Netware is set to ON
- 5) Exit the Apple Printer Utility

Step 2 - Configure with PCONSOLE
=====

NOTE: The Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS must be configured as printer "0". This is not an option because other printer number assignments do not work. This may require recreating configurations for other printers being serviced by PSERVER.

- 1) Run PCONSOLE from a DOS Client
- 2) Select Print Server Information
- 3) Press INS to create new print server
- 4) Enter the Print Server name from Step 1
- 5) Press Return
- 6) Select Full Name press enter

- 7) Enter: RPRINTER <Any Printer Name> <0> - and press enter
Note: This printer requires the first Printer definition, that is "0",
to work properly, also write down the printer name for later
- 8) Select Print Server Configuration
- 9) Select Printer Configuration
- 10) Select printer 0 not installed
- 11) Enter the name enter into "Full Name"
- 12) Select Type - press return
- 13) Select Remote other unknown - press return
- 14) Press escape back to Available Options - answer yes when prompted to
save
- 15) Select Print Queue Information
- 16) Press INS
- 17) Enter any name for a queue name
Note: Write down the Queue name for later
- 18) Press enter
- 19) Press enter on that queue name
- 20) Select Queue Servers press enter
- 21) Press INS
- 22) Select the queue server name that you entered earlier
- 23) Press return
- 24) Press ESC until you are back to available options - Save any changes
if asked
- 25) Select Print Server Information Menu press return
- 26) Select Print Server Configuration
- 27) Select Ques Serviced by Printer
- 28) Press return twice
- 29) Press INS
- 30) Select the Queue that you have setup for this printer - press enter
twice
- 31) Escape out of PCONSOLE - saving changes of asked
- 32) At the Netware server:
Enter: LOAD PSERVER <REMOTE-PSERVER-NAME>
The REMOTE-PSERVER-NAME will be the same from Step 1

Step 3 - Restart Printer =====

If the printer does not show waiting print job on the PSERVER screen,
restart the printer.

Step 4 - Print to the Queue =====

- 1) Enter: capture q=q_name/no banner/ti=5
- 2) z:
- 3) print fontlist.ps

Article Change History:
23 Oct 1996 - Added Color LaserWriter 12/660 PS.

05 Mar 1996 - Removed LaserWriter 16/600 PS from article.

05 Feb 1996 - Updated Step 2, and added LaserWriter 16/600 PS printer.

AppleShare Client for Windows and AppleTalk Phase I (1/96)

Revised: 1/19/96
Security: Everyone

AppleShare Client for Windows and AppleTalk Phase I (1/96)

=====
Article Created: 2 November 1995
Article Reviewed/Updated: 19 January 1996

TOPIC -----

I'm unable to access any of the computers on an AppleTalk Phase I network, however, on an AppleTalk Phase II network connections work properly.

DISCUSSION -----

AppleShare Client for Windows does not support AppleTalk phase I. Version 1.0.2 now supports LocalTalk. The solution is to upgrade those AppleTalk Phase I segments to AppleTalk Phase II.

Article Change History:
19 Jan 1996 - Corrected version number.

Power Macintosh: Memory Interleaving Performance Gain (6/96)

Revised: 6/27/96
Security: Everyone

Power Macintosh: Memory Interleaving Performance Gain (6/96)

=====

Article Created: 2 November 1995
Article Review/Updated: 27 June 1996

TOPIC -----

Is there any information available on the performance gains or losses when using interleaved instead of non-interleaved memory on PCI-based Power Macintosh computers?

Specifically how much of a speed advantage would be lost if you use one 16 MB DIMM rather than two 8 MB DIMMs in an interleaved arrangement?

DISCUSSION -----

For increased performance it is better to configure a PCI-based Power Macintosh computer for memory interleaving rather than installing memory in a non-interleaved configuration. This means that you will get better performance if you configure your system with two 16 MB DIMMs rather than one 32 MB DIMM. This applies to all other combinations of same-sized DIMMs.

The actual performance will vary from computer to computer. In general, a Power Macintosh with a PowerPC 604 microprocessor, such as the Power Macintosh 8500 or 9500 series computer, gets anywhere from a 5% to 15% boost in performance. The average is about an 8% increase in performance speed. On a Power Macintosh with a PowerPC 601 microprocessor, such as the Power Macintosh 7500 series, you may get only a slightly better performance gain by using memory interleaving rather than non-interleaved DIMMs. Some third-party benchmarking applications may report exaggerated performance differences between interleaved and non-interleaved computers.

This article was published in the Information Alley on 26 June 1996.

Article Change History:

27 Jun 1996 - Added keyword.
26 Jun 1996 - Made minor correction.
10 May 1996 - Added information about exaggerated benchmarking results.

PowerBook 190 & 5300: Ethernet PC Card Switching (11/95)

Revised: 11/2/95
Security: Everyone

PowerBook 190 & 5300: Ethernet PC Card Switching (11/95)

=====

Article Created: 2 November 1995

TOPIC -----

I have several different Ethernet PC cards that I need to use. I seem to have trouble getting on the network when I switch cards. Why?

DISCUSSION -----

When switching between PC Cards on a Macintosh PowerBook 5300 Series computer, you must pay careful attention to any software drivers that get left behind that are no longer going to be used. The Ethernet drivers are particularly susceptible to "confusion" if not removed.

As an example of this, if you have a Dayna Ethernet card and switch to a PowerPort Platinum Pro PC Card, you will experience problems with Ethernet if you fail to remove the Dayna drivers. This is because the MacOS only recognizes two different Ethernet driver names, and Global Village and Dayna (in this case) have chosen the same name (Ethernet Driver). The symptom will be that Ethernet will work intermittently, if at all.

Be sure to get all the parts of the old driver software (use the Installer to remove/de-install the driver software, if possible) when removing it. In particular, be sure to remove the Ethernet driver from the System suitcase.

System 7.5: Startup Items Launch Order (11/95)

Revised: 11/6/95
Security: Everyone

System 7.5: Startup Items Launch Order (11/95)

Article Created: 2 November 1995

TOPIC -----

If I put several different items in the Startup Items folder of my System 7.5 Folder, how does the operating system determine the launch order?

DISCUSSION -----

This is how the System 7.5 Finder handles opening the items in the Startup Items folder.

After the Finder finishes loading at startup it "selects" all the items and executes an open items command. Next, the Finder groups everything into one of five classes: applications, documents, stationery, folders, and aliases. Aliases are resolved to their original item and then the resulting items are launched in the following order:

1) Applications

- Alphabetically

2) All documents with the same creator

- Alphabetically.
- Documents created by an application that is also in the list are opened when the application is launched, before other documents and before other applications.
- The Finder checks for stationery unaware applications or applications that do not automatically duplicate a file that has the Stationery pad option checked in its information window. If the Finder finds any stationery unaware applications and it is opening a stationery file for one of those applications, it duplicates the file before it starts launching any applications. The Finder then opens these duplicated files last, even though they may come alphabetically before

other files.

3) Remaining documents

- Alphabetically.

4) Everything else

- Sounds, folders, control panels, and font suitcases are opened alphabetically.

Arabic Language Kit: Description and Specifications (11/95)

Revised: 11/3/95
Security: Everyone

Arabic Language Kit: Description and Specifications (11/95)

=====

Article Created: 3 November 1995

TOPIC -----

The Arabic Language Kit allows users to display, input, edit and print Arabic or Persian documents on their Mac OS computer. The software is intended for educators and students, multinational businesses, and bilingual home users.

The following article contains a description of the Arabic Language Kit and lists its hardware and software requirement specifications.

DISCUSSION -----

Overview

=====

Apple's Arabic Language Kit is the easiest, most affordable way to add Arabic and Persian text to your documents.

After the simple installation process, you can switch effortlessly between the computer's main language and Arabic or Persian. The kit lets you enter, edit, and print Arabic and Persian text, and mix either language with left-to-right languages in the same document, even in the same sentence. The kit comes with a selection of keyboard layouts optimized for both native speakers and students, accompanied by transparent labels for customizing your keyboard.

The Arabic Language Kit can be used with most Mac OS-compatible applications that support right-to-left text entry (including multilingual applications), or that have been localized for Arabic or Persian. The kit works with the built-in multilingual capabilities of the Mac OS, so you can copy and paste or drag and drop text between applications. And you can work with documents created by colleagues in the Arab world who use the Arabic or Persian version of the Mac OS.

The kit includes a selection of Apple TrueType fonts to ensure high-quality on-screen and printed characters at any size. These fonts incorporate exciting

new typographic features based on Apple's QuickDraw GX technology. Most of the kit's fonts are also provided in PostScript versions.

The Arabic Language Kit is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. You can install as many different Apple Language Kits as you need on a single computer. Apple's other multilingual products include the Chinese Language Kit, the Chinese Dictation Kit, the Cyrillic Language Kit, the Hebrew Language Kit, the Japanese Language Kit, and others.

Technical Specifications =====

Usage Requirements -----

- - A Macintosh or PowerBook computer with a 68020 or later processor and 4MB of RAM
- OR-
- A Power Macintosh computer with 8MB of RAM
- An Apple SuperDrive floppy disk drive or a CD-ROM drive
- An application that has been localized for the target language or that supports right-to-left textOrdering Information

System Software Requirements -----

- Macintosh System 7.1 or later (System 7.5 or later required to take advantage of QuickDraw GX features)

Included fonts -----

- Arabic fonts
 - AlBayan (TrueType and Postscript)
 - Baghdad (TrueType and Postscript)
 - Cairo (bitmap)
 - Geeza (TrueType and Postscript)
 - Kufi (TrueType and Postscript)
 - Nadeem (TrueType and Postscript)
 - Thuluth (Postscript)
- Persian fonts
 - Amir (TrueType and Postscript)
 - Ashfahan (TrueType and Postscript)
 - Kamran (TrueType and Postscript)
 - Mashad (TrueType and Postscript)
 - NadeemFarsi (TrueType and Postscript)
 - Tehran (bitmap)

Compatible applications -----

The Arabic Language Kit is based on Apple's WorldScript I technology, and is compatible with applications that take advantage of WorldScript I. The applications listed below are multilingual and/or Arabic-localized products that have been tested with this kit; check with the software publisher for

compatibility information on other applications.

- PageMaker ME from Adobe Systems (distributed by WinSoft S.A.)
- HyperCard from Apple Computer, Inc.
- SimpleText from Apple Computer, Inc.
- ClarisWorks Arabic from Claris Corporation
- FileMaker Arabic from Claris Corporation
- El Nashir El Sahafi from Diwan
- Nisus Writer from Nisus Software Inc.
- WinText from WinSoft S.A.
- WorldWrite from World Software Corporation

Applications that support QuickDraw GX technology and the Arabic Language Kit include:

- Ready,Set,Go! GX International from Manhattan Graphics Corp.
- LightningDraw GX from Lari Software, Inc.

Features

=====

Versatile multilingual capabilities

- Switch between languages easily
- Combine different languages in the same document
- Install as many language kits as needed on a single Macintosh system

High-quality fonts

- Seven Arabic fonts and six Persian fonts
- Apple TrueType format for high-quality on-screen and printed characters
- Support for PostScript printers
- QuickDraw GX features for state-of-the-art typography*

* QuickDraw GX font features require System 7.5 or later, QuickDraw GX software, and a QuickDraw GX compatible application.

Ease of use

- Simple, flexible installation process
- Informative installation and user's guide (in English and French)
- Transparent labels for different keyboard layouts
- Keyboard quick-reference card

Compatibility

- Works with System 7.1 and all subsequent versions of the Mac OS
- Compatible with any localized version of the Mac OS and with other Apple

Language Kits

- Supports QuickDraw GX in System 7.5
- Runs in native mode on Power Macintosh computers

Ordering Information

=====

Arabic Language Kit

Order No. M4454Z/A

- Five 1.4MB floppy disks and one CD-ROM containing:
 - Arabic Language Kit
 - Standard Arabic and Persian keyboard layouts
 - Transliterated QWERTY and AZERTY keyboard layouts
 - SimpleText Arabic, a basic text-processing application
 - Demonstration versions of compatible applications and utilities
- Arabic Installation and User's Guide (in English and French)
- Transparent keyboard labels with Arabic and Persian characters

Cyrillic Language Kit: Description and Specifications (11/95)

=====

Article Created: 3 November 1995

TOPIC -----

The Cyrillic Language Kit allows users to display, input, edit and print documents in Bulgarian, Russian, Ukrainian, Belorussian, Macedonian, Serbian, or any other language based on the Cyrillic writing system on their Mac OS computer. The software is intended for educators and students, multinational businesses, and bilingual home users.

The following article contains a description of the Cyrillic Language Kit and lists its hardware and software requirement specifications.

DISCUSSION -----

Overview

=====

Apple's Cyrillic Language Kit makes it easy to create documents in any Cyrillic-based language.

This affordable, easy-to-install kit lets you switch effortlessly between the computer's main language and Bulgarian, Russian, or Ukrainian. You can also work in Belorussian, Macedonian, Serbian, or any other language based on the Cyrillic writing system. Cyrillic text can be mixed with other languages that your computer supports—including right-to-left and Asian languages—in the same document. The kit comes with a selection of keyboard layouts optimized for both native speakers and students, accompanied by transparent labels for customizing your keyboard.

The Cyrillic Language Kit works with almost any Mac OS-compatible application, including those that have been localized for Bulgarian, Russian, or Ukrainian. Because the kit builds on the inherent multilingual capabilities of the Mac OS, text created in one application can be copied and pasted or dragged and dropped into another application. With the kit, you can work with documents created by colleagues in Eastern Europe who use the Bulgarian, Russian, or Ukrainian

version of the Mac OS. You can also display Cyrillic-based World Wide Web servers.

The Cyrillic Language Kit includes a selection of Apple TrueType fonts, which ensure high-quality on-screen and printed characters at any size and feature exciting new QuickDraw GX typographic capabilities. The fonts provided in TrueType format are also supplied in PostScript versions.

This product is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. You can install as many different Apple Language Kits as you need on a single computer. Apple also offers the Arabic Language Kit, the Chinese Language Kit, the Chinese Dictation Kit, the Hebrew Language Kit, the Japanese Language Kit, and others.

Technical Specifications

=====

Usage Requirements

- - A Macintosh or PowerBook computer with a 68020 or later processor and 4MB of RAM
- OR-
- - A Power Macintosh computer with 8MB of RAM
- An Apple SuperDrive floppy disk drive or a CD-ROM drive
- An application that has been localized for the target language or that supports right-to-left textOrdering Information

System Software Requirements

- Macintosh System 7.1 or later (System 7.5 or later required to take advantage of QuickDraw GX features)

Included fonts

- APC Courier (TrueType and Postscript)
- Bastion (TrueType and Postscript)
- Latinski (TrueType and Postscript)
- Sistemny (bitmap)
- Pryamoy Prop (bitmap)
- Pryamoy (bitmap)

Compatible applications

The Cyrillic Language Kit can be used with almost every Macintosh application. However, the best results will be achieved with applications that have been developed specifically to support multiple languages, including:

- HyperCard from Apple Computer, Inc.
- SimpleText from Apple Computer, Inc.
- ClarisWorks from Claris Corporation
- Nisus Writer from Nisus Software Inc.
- WinText from WinSoft S.A.

- WordPerfect from Novell, Inc.
- WorldWrite from World Software Corporation

Applications that support QuickDraw GX technology and the Cyrillic Language Kit include:

- Ready,Set,Go! GX International from Manhattan Graphics Corp.
- LightningDraw GX from Lari Software, Inc.

Hebrew Language Kit: Description and Specifications (11/95)

=====

Article Created: 3 November 1995

TOPIC -----

The Hebrew Language Kit allows users to display, input, edit and print Hebrew documents on their Mac OS computer. The software is intended for educators and students, multinational businesses, and bilingual home users.

The following article contains a description of the Hebrew Language Kit and lists its hardware and software requirement specifications.

DISCUSSION -----

Overview

=====

With Apple's Hebrew Language Kit, adding Hebrew and Yiddish text to your documents is both easy and affordable.

This easy-to-install, easy-to-use kit lets you enter, edit, and print Hebrew and Yiddish text. You can switch effortlessly between these languages and the computer's main language. Hebrew and Yiddish can be mixed with left-to-right languages in the same document—even in the same sentence. The kit features a selection of keyboard layouts optimized for both native speakers and students, along with transparent labels for customizing your keyboard.

The Hebrew Language Kit works with most Mac OS-compatible applications that support right-to-left text entry, including multilingual and Hebrew-localized applications. Because the kit builds on the inherent multilingual capabilities of the Mac OS, text created in one application is transportable to another. You can copy and paste or drag and drop between applications, and work with documents created by colleagues in Israel who use the Hebrew version of the Mac OS.

The Hebrew Language Kit includes a selection of Apple TrueType fonts enhanced with exciting new QuickDraw GX typographic features. TrueType font technology

ensures high-quality on-screen and printed characters at any size.

This product is part of a family of Apple language solutions, which offer an affordable way to internationalize your Macintosh system. You can install as many different Apple Language Kits as you need on a single computer. Apple's multilingual product offerings include the Arabic Language Kit, the Chinese Language Kit, the Chinese Dictation Kit, the Cyrillic Language Kit, the Japanese Language Kit, and others.

ARA 2.0.x Connection and No IP Address (11/95)

Revised: 11/4/95
Security: Everyone

ARA 2.0.x Connection and No IP Address (11/95)

=====

Article Created: 4 November 1995

TOPIC -----

Our remote users are dialing in with Apple Remote Access (ARA) 2.0.x to a Shiva LanRover 8/E, and we are intermittently not receiving an IP address from the server. We currently are restarting the remote computer and redialing. Do you have any idea how to correct this?

DISCUSSION -----

A problem that may be causing this is when MacTCP is configured for Manual addressing and the MacTCP stack is initialized before the ARA connection is made.

This can be reproduced by installing MacSNMP software on a remote Macintosh. MacSNMP software will load at startup and initialize the MacTCP stack, causing MacTCP connections over an ARA link to not work. Removing MacSNMP software from the remote Macintosh resolves this.

Internet Server For WWW: Number of Connections (11/95)

Revised: 11/4/95
Security: Everyone

Internet Server For WWW: Number of Connections (11/95)

=====

Article Created: 4 November 1995

TOPIC -----

How many users can log onto a WWW Internet Server? I'm interested in the number connecting through our LAN (local area network).

DISCUSSION -----

MacTCP has a limit of 64 sockets or simultaneous IP connections. Simultaneous IP connections under Open Transport will be limited by installed memory and processor power.

The WebSTAR server software, which comes with the Internet Server, keeps track of all connections. A log is generated which includes information on where the request came from as well as what the request was (file, image, html file), including the name of the file.

Each entry includes the DATE, TIME and RESULT (OK or ERROR) for the request made.

PowerTalk INET Gateway & Open Transport Compatibility (11/95)

=====

Article Created: 6 November 1995

TOPIC -----

When using the Mail*Link Internet for PowerTalk (PT/INET) Gateway 1.6 on my PCI-based Power Macintosh, the gateway will connect once but not again until I restart the computer. What is wrong?

DISCUSSION -----

This is a known issue which Apple is investigating. Below is a quote from the Mail*Link for PowerTalk/INET 1.6 Read Me file:

"Open Transport users: This gateway does not function correctly when used with Apple's OpenTransport. The gateway will connect one time but will not reconnect without a reboot. Apple is currently investigating problem."

AppleVision 1710AV: Lines on Screen (5/96)

Revised: 5/2/96
Security: Everyone

AppleVision 1710AV: Lines on Screen (5/96)

=====

Article Created: 6 November 1995
Article Reviewed/Updated: 2 May 1996

TOPIC -----

Various symptoms have been reported where there are lines on the screen.

Customers are reporting symptoms of horizontal or vertical lines on various parts of the screen. In particular:

- 1) display has 2 horizontal lines in the screen one-third of the way down and one-quarter of the way up;
- 2) thin red line on the outer left, outer right or top;
- 3) monitor changes from yellow to red approximately every 5 minutes and there are flickering horizontal lines every 10 seconds.

DISCUSSION -----

The following technical explanations may assist you in identifying the difference between a display problem, computer problem, or normal display operation.

Horizontal Lines
=====

Customer Issue:
Display has 2 horizontal lines in the screen one-third of the way down and one-quarter of the way up

Explanation:
This is the stabilization wires common to every Trinitron display. The construction of a Trinitron CRT includes one or two horizontal wires about one-quarter to one-third of the way down/up from the top/bottom of the display

image. The wire appears as a very thin light gray horizontal line across the entire width of the display image. The lines are common to all Trinitron displays. All replacement displays have the same lines.

Thin Red Line on Display =====

Customer Issue:

Thin red line on the outer left, outer right or top of the display.

Explanation:

Display convergence may need to be adjusted. This can be performed by the customer. If convergence is misadjusted, a color line, usually red or blue, on one or more sides of the display image appears. Convergence is adjusted using the Sounds & Displays control panel.

NOTE:

No CRT display device has perfect geometry (image shape) and convergence. Convergence should be adjusted for the best overall screen performance. A display with perfect convergence in one area of the screen may have slight misconvergence in another area (the adjustment should be made to have the best convergence balance over the entire screen). If the customer can make adjustments so the convergence is within a half millimeter, the display is working correctly.

Display Changes From Yellow to Red =====

Customer Issue:

Monitor changes from yellow to red approximately every 5 minutes and there are flickering horizontal lines every 10 seconds.

Explanation:

The display and the Macintosh computer attached to it should be checked by an authorized Apple Service provider. The problem described could be caused by a variety of problems including the video card, cable and connector, and display circuitry among other components. The entire system should be checked to properly isolate the problem.

Important Information About Your Macintosh PowerBook 190 Series Computer

Congratulations on purchasing your Macintosh PowerBook 190 series computer. This document adds to and updates the information in the manuals that came with your computer. It is a good idea to read this document now, and keep a copy handy for future reference.

If your PowerBook is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

Contents
=====

Tips

- Charging your battery
- Using the Battery Monitor in the Control Strip
- Using the trackpad
- Using a modem
- Using expansion bay modules
- Using PC Cards
- Using a DOS-formatted PC Card
- Using your PowerBook in SCSI disk mode
- Using Apple IR File Exchange
- Using the Password Security control panel
- Printing

Troubleshooting

- Problems starting your PowerBook
- Resetting the parameter RAM (PRAM)
- Using Drive Setup
- Using Acrobat Reader after installing QuickDraw GX
- Using Apple Remote Access
- Incorrect Guide File Balloons
- Using a DigiSign Signature Card with PowerTalk
- AppleShare Displays Incorrect Information for Large Drives
- AppleShare Server Software Version 4.1
- Application Programs Using Sound
- Using QuickDraw GX with a Fax Modem
- Using the Japanese Language Kit
- Using the Chinese Language Kit

Tips

=====

Charging your battery

You should connect the power adapter to your computer and let the battery charge overnight when you first unpack your computer. (The battery may have been depleted between the time it was charged at the factory and the time you purchased the computer.)

Using the Battery Monitor in the Control Strip

The estimated time remaining that is displayed in the Battery Monitor portion of the Control Strip depends on the charge remaining and the battery consumption rate. The battery consumption rate depends on the software and hardware features you are using.

Using The Trackpad

If the trackpad seems unresponsive, try the following in the order listed:

Step 1

Put your PowerBook to sleep (by closing the display) and then wake it up (by pressing any key on the keyboard).

Step 2

Press the reset button on the back of the computer.

Step 3

Reset the parameter RAM (PRAM) (see the section in Troubleshooting below for instructions).

Step 4

Attach an external mouse.

Using A Modem

• If you are using the LocalTalk or IRTalk, turn off AppleTalk in the Chooser to improve modem performance.

• Modem connection files for various PC Card modems that will work with Apple Remote Access (ARA) and AppleLink are included on your computer's hard disk. The modem files for ARA are in the Extensions folder. If a file for your modem is not included, please contact your communications software manufacturer to see if your modem is supported. See the user's manual that came with your computer for more information on using PC Card modems.

• When accessing the internet using the InterSLIP protocol, use the 14.4K baud rate rather than the 28.8K baud rate for better performance. The actual throughput at 14.4K baud is higher than at 28.8K baud.

Using Expansion Bay Modules

Never remove a floppy disk from the expansion bay module while the PowerBook is in sleep. You may damage the disk or lose data.

Using PC Cards

• For best results, purchase only cards that have been qualified for use on a Macintosh computer. If you are in the United States, you can receive a faxed list of currently available PC Cards by calling 1-800-462-4396 and requesting document 10307. You can call this number anytime. In Canada, call 1-800-263-3394 and request document 10307. Outside the United States and Canada, please consult your Apple-authorized dealer.

• Do not use an SRAM storage card as a startup disk on your PowerBook. Use SRAM cards for extra storage only.

• If you are using a mass storage PC Card, you can only eject the card using the eject buttons when the computer is shut down. The eject buttons will not work with storage PC Cards when the computer is turned on.

- Never eject a PC Card manually (with a paper clip) while the PowerBook is in sleep. You may damage the card or lose data.

Using a DOS-formatted PC Card

If your PowerBook has the Macintosh PC Exchange control panel installed and PC Exchange is turned on, you can use a PC Card that has been preformatted in a DOS format in your PowerBook. However, you cannot start up your computer using the DOS-formatted PC Card; you can only start up your computer using a Mac OS-formatted PC Card. If you want to reformat your DOS-formatted PC Card as a Mac OS-formatted PC Card, you need to turn PC Exchange off, and then format the card as you would any non-Mac OS-formatted disk. Follow these steps:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Open the PC Exchange control panel.

Step 3

Click the Off button and close the PC Exchange control panel.

Step 4

Insert your PC Card. A window appears asking if you want to initialize (format) the disk.

Step 5

Click Initialize to format the PC Card. Once the PC Card is reformatted, you can turn Macintosh PC Exchange back on in the PC Exchange control panel.

You cannot reformat a Mac OS-formatted PC Card as a DOS-formatted PC Card with PC Exchange. To do so, you need to use a DOS/Windows computer with PC Card capabilities.

Using Your PowerBook In SCSI Disk Mode

- Using Norton Utilities Speed Disk or Disk Doctor from a desktop computer on your PowerBook while it is in SCSI disk mode may cause the desktop computer to crash or freeze. To avoid this problem, create an emergency startup floppy disk using Norton Utilities and then use that disk to startup your PowerBook.
- You cannot use password protection on your PowerBook while the PowerBook is in SCSI disk mode. Turn off password protection in the Password Security control panel before connecting your PowerBook in SCSI disk mode.

Using Apple IR File Exchange

Apple IR File Exchange provides a very simple way to exchange files with another IR-equipped Macintosh user. You need to upgrade your computer with the PowerBook Infrared Upgrade Card before you can use Apple IR File Exchange.

- If you use Apple IR File Exchange with a computer that is equipped with a third-party IR device and is also connected to a wired network (for example, a LocalTalk or Ethernet network), you may see other Apple IR File Exchange users that are beyond your local IR network. If you want to prevent this from happening, select IRTalk in the Network control panel on the computer that is connected to the wired network. (This will have the effect of disconnecting that computer from the wired network. See the manufacturer's manual for more details.)
- If you see a dialog box telling you there is a broken connection, make sure that both you and the other Apple IR File Exchange user select the same option (either "break connection" or "continue"). If the other user breaks the connection and you try to continue, your computer may appear to hang for 2 minutes while it tries unsuccessfully to reestablish the connection.
- When you select IRTalk in the Network control panel, your computer chooses a random network address. Occasionally, you may come within range of another computer using the same network address and experience difficulty communicating with it.

When this occurs, you'll see a dialog box telling you that a duplicate AppleTalk address has been detected. Click OK in the dialog box, then open the Network control panel and select IRTalk again. This will give your computer a new network address and will correct the problem. (Alternately, you can activate and inactivate AppleTalk from the Control Strip or the Chooser.)

Using the Password Security Control Panel

The Password Security control panel provides security for information stored on your hard disk. To use this feature, you must enter a password and turn it on. If you forget or lose your password, you will not be able to access your hard disk. Should you lose your password, you may be charged for assistance.

You cannot use your PowerBook in SCSI disk mode with password protection turned on in the Password Security control panel. You must turn it off before using your PowerBook in SCSI disk mode.

Information stored on PC Cards is not protected by password security. Password security is designed to prevent casual access to your hard drive. It does not provide encryption.

Printing

If you are printing on a network printer, make sure you have the same version of printer software as others on the network. If you are using a StyleWriter II on a network, make sure you use the StyleWriter 2.0 printer driver. (Printer drivers are found in the Extensions folder).

Troubleshooting

=====

Problems Starting Your PowerBook

If you have problems starting your PowerBook immediately after you shut it down (for instance, you see the "Sad Mac" icon on the screen), wait several seconds after shutting down, and then press the Power key to turn the computer on again.

Resetting the parameter RAM (PRAM)

When you need to reset (or "zap") your PowerBook's PRAM, follow the steps below. Note that resetting the PRAM erases the contents of your RAM disk, if you have one. Resetting the PRAM also restores the default settings in most control panels. After you reset the PRAM, be sure to check any custom settings you made for the desktop pattern, memory, network, AppleTalk, trackpad, power conservation, and so forth. Resetting the PRAM also resets the power manager.

Follow these steps to reset the PRAM:

Step 1

Locate the keys Command, Option, P, and R.

Step 2

Make sure the Caps Lock key is not down.

Step 3

Restart your Macintosh. Immediately after hearing the startup sound, press the Command, Option, P, and R keys simultaneously.

If you do not hold down the key combination within 5-10 seconds after you restart, you may need to repeat steps 1-3.

Step 4

Hold down the keys until you hear the startup sound. Then release the keys.

Step 5

If the computer shuts itself off, press the Reset key on the back of your

computer to turn it back on.

Step 6

When the computer has finished starting up, you may need to restore control panel settings as well as network and printer settings in the Chooser.

Using Drive Setup

Make sure you only use the Drive Setup application program that comes with your PowerBook to update and partition hard disks. If you use an earlier version of Drive Setup (called HD SC Setup) you could damage your computer.

Using Acrobat Reader After Installing QuickDraw GX

Once you install QuickDraw GX, you need to reinstall Acrobat Reader on your computer in order to use it. Double-click the Acrobat Reader Installer icon in the Adobe Acrobat Reader folder (inside the Applications folder).

Using Apple Remote Access

Make sure you use only Apple Remote Access Client version 2.0.1 on your PowerBook. Earlier versions will not work.

Incorrect Guide File Balloons

Your system software includes Apple Guide documents which provide on screen instructions and other information to help you use your computer. However, if you turn on Balloon Help (by choosing Show Balloons from the Guide menu) and point to a Guide file icon on the hard disk, the balloon may give you the wrong information about where the file belongs or what you can do with it. To avoid being misled by incorrect balloons, follow the guidelines below:

- Leave Guide files where they are. Some Guide files (for example, the Guide file named "Macintosh Guide") belong in the Extensions folder. Others will not work if they are put into the Extensions folder.
- Keep application programs that have Guide files in the same folder as the Guide file. For example, keep the file named "File Assistant Guide" in the same folder as the File Assistant program. If you move a Guide file that belongs with an application program, you will not be able to get help while using the program.

Using A DigiSign Signature Card With PowerTalk

To use the Apple DigiSign Utility with PowerTalk, follow these steps:

Step 1

Turn off processor cycling in the PowerBook control panel. To see the option for processor cycling, hold down the option key while you select Custom in the PowerBook control panel.

Step 2

Follow the steps for creating a Signer file.
If you need help, select "How do I obtain a valid Signer file?" in the Digital Signatures topic of the PowerTalk Guide.

Step 3

Turn processor cycling back on in the PowerBook control panel.

AppleShare Displays Incorrect Information For Large Drives

If you use file sharing to connect to a disk attached to another computer, and the shared disk is larger than 2 gigabytes (GB), the Get Info box for that disk shows an incorrect size. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

AppleShare Server Software Version 4.1

If you purchase AppleShare server software version 4.1, make sure to choose Custom Install (instead of Easy Install) when you install it.

NOTE: This note is not part of the original Read Me, it is being added to correct information presented here. AppleShare 4.1 or later is not sold separately and is available when purchasing a Workgroup Server. Also AppleShare v 4.1 or 4.2 is not supported on these computers.

Application Programs Using Sound

If you have application programs that make extensive use of sound, you should turn off virtual memory while using those programs. When virtual memory is turned on, it can compromise the programs' sound quality.

Some older versions of programs, especially games, may generate sounds that seem too slow or too fast. For best results with these programs, open the Sound control panel, choose Sound Out from the pop-up menu, and set the sample rate to 22.050 kHz.

Using QuickDraw GX With A Fax Modem

If you installed QuickDraw GX and you have a fax modem, you need a QuickDraw GX modem driver in order to send faxes. Contact the fax software manufacturer to obtain the QuickDraw GX driver.

If you have installed QuickDraw GX and do not yet have the QuickDraw GX modem driver, you can temporarily turn off QuickDraw GX and use your previous fax modem driver. To turn off QuickDraw GX:

Step 1

Hold down the Space bar while you choose Restart from the Special menu to restart your PowerBook. Continue to hold down the Space bar until the Extensions Manager appears on the screen.

Step 2

Click the QuickDraw GX extension to remove the check beside it. This prevents the QuickDraw GX software from loading.

Step 3

Click the close box in the Extensions Manager window to resume startup. Your fax modem should work normally. You will not be able to use any QuickDraw GX features until you turn the extension back on again.

Using the Japanese Language Kit

To use the Japanese Language Kit with your Macintosh PowerBook, make sure you use version 1.2 or later. In the United States, you can obtain an upgrade, with proof of purchase, by calling the Apple Order Center. Customers outside of the United States should contact their local Apple-authorized dealer.

After you install the Japanese Language Kit 1.2, you need to replace an extension that gets installed with the software. Follow these steps:

Step 1

Follow the instructions for installing the Japanese Language Kit 1.2 that came with the software.

Step 2

After you see that the installation was successful, restart the computer with the Extensions off. To do this, hold down the shift key while you press the Restart button in the installer screen (or as you choose Restart from the Special menu).

Step 3

Double-click the Apple Extras folder to open it.

Step 4

Double-click the JLK 1.2 Update folder to open it.

Step 5

Drag the file called "Font Extension 3" to the Extensions folder (inside the System folder) on your hard disk. Click OK if you see a dialog box asking if it is ok to replace this file.

Step 6

Choose Restart from the Special menu.

Using the Chinese Language Kit

To use the Chinese Language Kit with your Macintosh, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, first install the World Script Updater 1.0. Then install the Chinese Language Kit version 1.1. Finally, install the Chinese Language Kit Updater to update your software to version 1.1.1.

To install the World Script Updater, follow these steps:

Step 1

Double-click the Apple Extras folder to open it.

Step 2

Double-click the World Script Install folder to open it.

Step 3

Double-click the World Script Installer icon.
Follow the instructions on the screen.

Step 4

Follow the instructions that came with the language kit to install the language kit software.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Group IV TIFF Viewer for Macintosh (11/95)

Revised: 11/7/95
Security: Everyone

Group IV TIFF Viewer for Macintosh (11/95)

=====

Article Created: 7 November 1995

TOPIC -----

I need to find a viewer for Group IV TIFF that runs on a Macintosh. Group IV TIFF is a standard format used in the PC environment. Scanners from Xionx, Kofax, Seaport Imaging (Cornerstone) use Group IV TIFF as their native file format. I have several of these files on a server and would like to make them available on the Web, and I want to be able to point users to a free or low-cost viewer application.

Is there free ware or public-domain viewers available that a Macintosh can use?

DISCUSSION -----

TIFF Group4 images should be able to be opened with most any current application that supports the TIFF standard. Below are three applications that should be able to handle the task of opening your TIFF files.

GraphicConverter

Available at:

ftp://mirror.aol.com/pub/info-mac/_Graphic_%26_Sound_Tool/_Graphic/

GraphicConverter is share ware. It converts pictures to different formats. Also it contains many useful features for picture manipulation. GraphicConverter imports PICT, Startup-Screen, MacPaint, TIFF (uncompressed, packbits, CCITT3/4 and lzw), RIFF, PICS, 8BIM, 8BPS/PSD, JPEG/JFIF, GIF, PCX/SCR, GEM-IMG/-XIMG, BMP (RLE compressed BMP's also), ICO/ICN, PIC (16 bit), FLI/FLC, TGA, MSP, PIC (PC Paint), SCX (ColorIX), SHP, WPG, PBM/PGM/PPM, CGM (only binary), SUN , RLE, XBM, PM, IFF/LBM, PAC, Degas, TINY, NeoChrome, PIC (ATARI), SPU/SPC, GEM-Metafile, Animated NeoChrome, Imagic, ImageLab/Print Technic, HP-GL/2, FITS, SGI, DL, XWD, WMF, Scitex-CT, DCX, KONTRON, Lotus-PIC, Dr. Halo, GRP, VFF, Apple IIgs, AMBER, TRS-80, VB HB600, ppat, QDV, CLP, IPLab, SOFTIMAGE, GATAN, CVG and MSX.

JPEGView

Available at:

<http://www.med.cornell.edu/jpegview.html>

JPEGView is postcardware. It is a fast, powerful image viewer for both 680x0 and PowerPC Macintoshes. JPEGView can open and display images in JPEG, PICT, GIF, TIFF, BMP, MacPaint, or Startup Screen formats.

NIH Image

Available at:

<ftp://zipppy.nimh.nih.gov/pub/nih-image/>

NIH Image is a public domain image processing and analysis program for the Macintosh. It can acquire, display, edit, enhance, analyze and animate images. It reads and writes TIFF, PICT, PICS and MacPaint files, providing compatibility with many other applications, including programs for scanning, processing, editing, publishing and analyzing images. It supports many standard image processing functions, including contrast enhancement, density profiling, smoothing, sharpening, edge detection, median filtering, and spatial convolution with user defined kernels.

Retrospect: -50, feature not supported Error (11/95)

Revised: 11/7/95
Security: Everyone

Retrospect: "-50, feature not supported" Error (11/95)

=====

Article Created: 7 November 1995

TOPIC -----

I'm using Retrospect 2.0ci on an Apple Workgroup Server (AWS) 95. Last night I encountered the following error during an unattended backup:

Error -50 : Feature not supported

I have not made changes to my script and backups have been without error for several weeks. I cannot find a description of this error and would appreciate feedback on how it is triggered.

DISCUSSION -----

The "-50, feature not supported" error is reported when Retrospect tries to automatically mount a shared volume that no longer exists.

You should go to your backup scripts and remove this volume. If you are unsure which volume it is, go Immediate > Volumes, select a file-shared volume, and try to scan it. If you can scan it, it is fine; repeat the process for the other file-shared volumes.

If you get an error, you should then choose to "Forget" the volume.

Color LaserWriter 12/600 PS: Using External Hard Drives (11/95)

Revised: 11/8/95
Security: Everyone

Color LaserWriter 12/600 PS: Using External Hard Drives (11/95)

=====

Article Created: 8 November 1995

TOPIC -----

The Apple Color LaserWriter PS Internal Hard Disk Upgrade (M3875G/A) provides 240 MB of storage. What options are available for customers who need more than 240 MB of storage?

DISCUSSION -----

Apple provides an internal hard drive solution which uses hard drive mechanisms that have been thoroughly tested with the Color LaserWriter 12/600 PS. Apple engineering does not have the resources to test and qualify all of the different hard drives on the market. However, during their testing they found that the IBM hard drives selected for this printer work fine and satisfy the needs of a majority of customers. Customer's who need larger storage capabilities than those provided by the Color LaserWriter 12/600 PS Internal Hard Disk (M3875G/A) should use the external SCSI connection. Here is some information on connecting external hard drives to the Color LaserWriter 12/600 PS. This information is available in the User's Manual:

Using external hard disks from manufacturers other than Apple

IMPORTANT Some older model hard disk drives may not be compatible with the Color LaserWriter 12/600 PS

If you are considering connecting external hard disks to your printer, keep these points in mind:

- The printer requires SCSI 40 MB (or larger) hard disks
- The printer must be able to tell how much storage space is available on the disk. This is not possible with some hard disks from manufacturers other than Apple. You cannot use these disks with the printer.
- Some non-Apple disks have internal SCSI terminators. There should be no more

than one terminator in addition to the one on the printer's controller board (one on the first device in the chain and one on the last device).

- The hard disk must be able to deliver at least 5 volts of termination power.

AppleScript: Changing a Script Saved as an Application (11/95)

Revised: 11/8/95
Security: Everyone

AppleScript: Changing a Script Saved as an Application (11/95)

=====

Article Created: 7 November 1995

TOPIC -----

How can I make changes to an AppleScript saved as a compiled application?

DISCUSSION -----

If the compiled AppleScript, or applet, was not saved as a Run-Only application, there are several ways to modify it. An AppleScript that has been saved as Run-Only does not save the original AppleScript text for re-editing.

Here are three ways to access the AppleScript Text of a non Run-Only applet.

1) Press and hold the control key while double-clicking on the applet. When the Applet's splash screen appears with its Run or Quit options, select Edit Script from the Edit menu. This will launch the Script Editor, if it's not already running, and open a Script Editor window with the compiled AppleScript text.

2) Drag the AppleScript Applet onto the application icon of the Script Editor. This will launch the Script Editor, if it's not already running, and open a Script Editor window with the compiled AppleScript text.

3) Launch the Script Editor and choose Open Script from the File menu. Use the open file dialog to navigate and select the applet you wish to edit. The Script Editor will open a window with the compiled AppleScript text.

Apple Personal Diagnostics: Frequently Asked Questions (1/97)

Revised: 1/17/97
Security: Everyone

Apple Personal Diagnostics: Frequently Asked Questions (1/97)

=====

Article Created: 27 November 1995
Article Review History: 17 January 1997

TOPIC -----

This article contains frequently asked questions (FAQ) on the Apple Personal Diagnostics (APD) software.

Questions answered in this FAQ:
=====

- 1) Apple Personal Diagnostics reports a disk or directory problem with my hard disk, but when I run Disk First Aid, no problems are found. What is causing this contradiction?
- 2) I have noticed that running APD while using video mirroring is causing trouble. Is APD compatible with video mirroring?
- 3) Is the Apple Personal Diagnostic (APD) 1.0 compatible with Power Macintosh computers?
- 4) I have System 7.5 with the System 7.5 Update 1.0 installed on my Power Macintosh computer. My Apple Personal Diagnostics 1.1 is reporting problems with my Power Macintosh computer's logic board. What should I do?
- 5) Is Apple Personal Diagnostics (APD) version 1.1.3 supported on the Power Macintosh 7200, 7500, and 8500 computers?
- 6) Sometimes when I try to launch my Apple Personal Diagnostics software or while I am using it, I get a low-memory alert. How do I correct this?
- 7) I ran the Disk First Aid utility and it said my hard disk needed to be repaired. However, the Repair button is dimmed.
- 8) I am following the System 7.5 upgrade guide, attempting to update the hard drive with Apple HD SC setup and it is unable to locate a suitable SCSI device.

I can see my hard disk icon. What does that message mean? Can I skip this step?

9) I ran the Disk First Aid utility and it said it found problems, but Disk First Aid cannot repair them. What should I do?

DISCUSSION -----

1) Question: Apple Personal Diagnostics reports a disk or directory problem with my hard disk, but when I run Disk First Aid, no problems are found. What is causing this contradiction?

Answer: Under some circumstances, Apple Personal Diagnostics may incorrectly report disk or directory problems, but drive diagnostics such as Disk First Aid may not find these problems. This situation is usually caused by extension conflicts with the Apple Personal Diagnostic utility.

For best results, when running Apple Personal Diagnostics, disable Extensions by holding down the Shift key at startup, then run the diagnostics.

2) Question: I have noticed that running APD while using video mirroring is causing trouble. Is APD compatible with video mirroring?

Answer: Apple Personal Diagnostics has known incompatibilities with video mirroring. If you sometimes use the video mirroring option, Apple recommends you make sure video mirroring is turned off before running APD.

3) Question: Is the Apple Personal Diagnostic (APD) 1.0 compatible with the Power Macintosh computers?

No, however APD version 1.1.1 fully supports the Power Macintosh 6100, 7100, and 8100 series computers. APD version 1.1.3 adds additional support for the Power Macintosh 9500 computer.

You can download the Apple Personal Diagnostics 1.1.3 Update from one of the Apple Software Updates areas located on America Online, CompuServe, and the Internet:

- * America Online - keyword: applecomputer

- * CompuServe - GO APLSUP

- * Internet -
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com>>

You can also call the Apple Order Center for the upgrade. The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

4) Question: I have System 7.5 with the System 7.5 Update 1.0 installed on my Power Macintosh computer. My Apple Personal Diagnostics 1.1 is reporting problems with my Power Macintosh computer's the logic board. What should I do?

Answer: Apple Personal Diagnostics 1.1 is generating a false error message. To resolve this you need to upgrade to at least version 1.1.1. The current version is 1.1.3.

You can download the Apple Personal Diagnostics 1.1.3 Update from one of the Apple Software Updates areas located on America Online, CompuServe, and the Internet:

- * America Online - keyword: applecomputer

- * CompuServe - GO APLSUP

- * Internet -
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com>>

You can also call the Apple Order Center for the upgrade. The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

5) Question: Is Apple Personal Diagnostics (APD) version 1.1.3 supported on the Power Macintosh 7200, 7500, and 8500 computers?

Answer: APD 1.1.3 is not supported on these computers. Here is a list of Apple computers supported by Apple Personal Diagnostics v1.1.3:

Apple Workgroup Server 60
Apple Workgroup Server 80
Apple Workgroup Server 95
Workgroup Server 6150

Power Macintosh 8100 Series
Power Macintosh 9500 Series

Note: APD also tests the Power Macintosh Upgrade and Macintosh Processor Upgrade cards. APD does not test the DOS Compatible Card or DOS Compatibility Upgrade Card.

6) Question: Sometimes when I try to launch my Apple Personal Diagnostics software or while I am using it, I get a low-memory alert. How do I correct this?

Answer: Apple Personal Diagnostics returns a low-memory alert when the APD application does not have enough memory to run or is running low on memory. For example, if you have created a report that requires more memory than is currently available. To allocate more memory to the APD application, you can do one or more of the following:

If you are using System 7.x, or System 6 with MultiFinder try the following:

- Quit other applications that may be running at the same time as APD
- If you have sufficient RAM installed in your system: quit the APD application, click once on the APD application icon, under File choose Get Info, increase the "preferred" application memory size from 1200K to 1500K
- Close any open report
- Reduce the size of any installed RAM disk and the system RAM cache.

If you are using System 6 with Finder rather than MultiFinder:

- Close any open report
- Reduce the size of any installed RAM disk and the system Disk cache

7) Question: I ran the Disk First Aid utility and it said my hard disk needed to be repaired. However, the Repair button is dimmed.

Answer: Disk First Aid is not being used properly. You cannot repair the startup disk with Disk First Aid. If you started from your hard drive, Disk First Aid cannot repair it until you start your Macintosh from another startup disk. Make sure you are starting up from your Power Macintosh CD, the System 7.5 Disk Tools floppy diskette, or other bootable disk. Disk First Aid also cannot repair the disk from which it was launched or any disk attached to a computer that has File Sharing turned on.

8) Question: I am following the System 7.5 upgrade guide, attempting to update the hard drive with Apple HD SC setup and it is unable to locate a suitable SCSI device. I can see my hard disk icon. What does that message mean? Can I skip this step?

Answer: This message may appear for two reasons:

- You may have used a non-Apple formatting utility to format your hard disk. If you have been using a previous version of System 7, you can safely skip this step and continue on with the installation of System 7.5. If you have been running System 6 or earlier, you should check with the vendor of either your hard drive or your hard drive's formatting utility and verify compatibility.
- Your computer may have an IDE hard drive which Apple HD SC Setup is not designed to format or update. You should use Drive Setup 1.0.2 to test, format, and partition your IDE hard drive.

The following computers use IDE hard drives:

Macintosh 630 Family computers*

Macintosh LC 580

Macintosh Performa 5200 series computers

Macintosh Performa 5300 series computers

Macintosh Performa 6200 series computers

Macintosh Performa 6300 series computers

Macintosh PowerBook 150 series computers

Macintosh PowerBook 190 series computers

Macintosh PowerBook 2300 series computers

Macintosh PowerBook 5300 series computers

Power Macintosh 5200/75 LC

Power Macintosh 5300/100 LC

*Note: The Macintosh 630 Family includes the following computers: Macintosh LC 630, Quadra 630, and Performa 630, Performa 635, Performa 636, Performa 637, and Performa 638.

9) Question: I ran the Disk First Aid utility and it reported it found problems, but Disk First Aid cannot repair them. What should I do?

Answer: This message indicates you have a corrupted directory structure. Apple

recommends backing up and reformatting a hard drive with a damaged directory. There are, however, third-party utilities such as "The Norton Utilities for the Macintosh", "Symantec Utilities for the Macintosh", and "Central Point's MacTools DiskFix" that attempt to repair damaged directories.

If a third-party utility cannot repair your hard disk, then back up all the data on your hard disk and reformat it using Apple HD SC Setup if you have a SCSI hard drive, Drive Setup 1.0.2 if you have an IDE hard drive.

Security: Everyone

JLK: PowerBook 190, Freezes After Installation (5/96)

Article Created: 8 November 1995
Article Reviewed/Updated: 14 May 1996

TOPIC -----

I have successfully installed the Japanese Language Kit (JLK) 1.2 on my PowerBook 190cs. When I restart my computer, it hangs after the Mac OS graphic. The menu bar is blank and the cursor is frozen. What is wrong?

DISCUSSION -----

The Macintosh PowerBook 190 and 190cs computers require you to install the Font Extension 3 software in the System Folder of your computer in order for the JLK software to load properly. This extension is in the Apple Extras folder on your PowerBook computer's hard drive.

Use the following procedure from the JLK Read Me to install the Font Extension 3 software.

Step 1

Follow the instructions for installing the Japanese Language Kit 1.2 that came with the software.

Step 2

After you see that the installation was successful, restart the computer with the Extensions off. To do this, hold down the shift key while you press the Restart button in the installer screen (or as you choose Restart from the Special menu). Continue holding the shift key down until you see the "Welcome to Macintosh, Extensions off" message.

Step 3

Double-click the Apple Extras folder on your hard drive to open it.

Step 4

Double-click the JLK 1.2 Update folder to open it.

Step 5

Drag the file "Font Extension 3" to the Extensions folder (inside the System Folder) on your hard disk. Click OK if you see a dialog box asking if it is ok to replace this file.

Step 6

Choose Restart from the Special menu.

Your JLK software is now ready to use.

Performa 5200,5300,6200,6300: Static Sound (2/96)

Revised: 2/16/96
Security: Everyone

Performa 5200,5300,6200,6300: Static Sound (2/96)

Article Created: 8 November 1995
Article Reviewed/Updated: 16 February 1996

TOPIC -----

I just restored the system software on my Macintosh Performa computer. Now, I hear static whenever my computer plays any sounds, except for audio CD-ROM discs.

DISCUSSION -----

Power Macintosh or Macintosh Performa 5200, 5300, 6200, and 6300 series computers with 16-bit audio capabilities may experience static when playing sounds from the hard drive or CD-ROM discs. However, audio CD-ROM discs sound fine.

To resolve this, you need to install the Audio Volume Extension. Although these computers originally included the Audio Volume extension, the system software CD may not include it. You can download a copy of the Audio Volume Installer disk image from the Apple Software Update locations. Follow the steps below to determine if you need this extension:

Step 1

Verify that your computer has 16-bit sound.

1. Open the Sound control panel
2. Select Sound Out from the Alert Sounds pop-up menu.
3. Check to see if the 16-bit radio button is selected. If so, your computer has 16-bit sound. If 8-bit sound is selected, you do not need the Audio Volume extension.

Step 2

Determine when the static occurs.

1. Verify that the static occurs only from programs on the hard disk or CD-ROM disc, not audio CD-ROM discs.
2. Open the Sound control panel. Listen to several of the standard system alert sounds at both even- and odd-numbered alert volume levels.

If you hear any distortion or static during the playback of these sounds at even numbered alert levels **ONLY**, then you should install the Audio Volume Extension. If you hear distortion or static at all levels, it is recommended to have the computer serviced.

MacX 1.5 Read Me (4/97)

Revised: 5/1/97
Security: Everyone

MacX 1.5 Read Me (4/97)

=====

Article Created: 8 November 1995

TOPIC -----

This article is the MacX 1.5 ReadMe file.

DISCUSSION -----

MacX 1.5 is Apple Computer's enhanced X Window System server for the Apple Power Macintosh and 680x0-based Macintosh platforms. MacX lets users work with Macintosh applications and network-based X client applications simultaneously on their desktops.

Here are some of the features that are new to MacX 1.5:

- X11R5 compliance
- Acceleration for Power Macintosh computers (fat binary for PowerPC-based and 680x0-based support)
- Performance tuning for 680x0 computers (new compiler)
- Standard X11R6 fonts (.PCF and .BDF files)
- Standard X11 font server access
- Standard X11 XDM support (for starting Unix X sessions)
- Support for XIE (X Image Extension) on PowerPC platforms
- A sample font directory with CDE font aliases
- Balloon Help
- Single-button installation

- Support for core Apple events
- New remote login option (RSH)
- Upgrade to MacTCP 2.0.6

MacX 1.5 retains many of the MacX 1.2 features, including support for multiple monitors, the ability to display rooted and rootless windows simultaneously, built-in window management for rootless windows, and the ability to cut and paste text and graphics.

System Requirements

=====

- System 7.0 or higher
- Apple Macintosh with 68030 or 68040, or Power Macintosh processor
 - 680x0 users will benefit from having 8 or more megabytes (MB) of RAM
 - Full installation requires approximately 13 MB of disk space
 - Minimal installation requires approximately 7 MB of disk space
- Ethernet hardware

MacX users typically access X clients with TCP/IP over Ethernet. MacX 1.5 includes MacTCP version 2.0.6. All Power Macintosh and many newer 680x0 computers include built-in Ethernet hardware. Users with other hardware configurations will need the appropriate NuBus or PDS slot Ethernet cards for their computers.

MacX 1.5 also works with DECnet software and other third-party TCP/IP software packages. In certain configurations, MacX also runs on AppleTalk connections with the appropriate router software.

Installation Notes

=====

Before starting the installation, restart your computer with extensions off. (Press and hold the Shift key while choosing Restart from the Special menu.) Double-click the MacX Installer Script icon to begin the installation.

Users who have already installed System 7.5 or later should already have a version of MacTCP installed that is compatible with MacX. If you already have version 2.0.6 or later of MacTCP installed on your computer, the MacX installation process will leave that version untouched.

If you have not previously used MacTCP on your system, you must set your computer's internet address in the MacTCP Control Panel. (See the MacTCP Administrator's Guide, which is provided on the MacX CD-ROM disc.) If you do not

have a domain name server available on your network, you will want to update the Hosts file in your System Folder with your local host names. You must restart for changes to take effect.

IMPORTANT:

If you have Open Transport installed on your computer (for example, new PCI-based computers), do not install MacTCP. (Choose the Custom Install option and skip installing MacTCP.) Be sure to fully configure your TCP/IP control panel to include a default router and a domain name server.

After installing MacX, you may want to increase its preferred memory size. Select the MacX application icon by clicking it once. Then choose Get Info from the File menu in the Finder. Enter a new preferred memory size in the Info dialog box.

Network Installation

=====

If your licensing agreement allows multiple copies of MacX, you may want to perform a network-based installation. Users with network access to the MacX CD-ROM can simply open up the MacX 1 folder and double-click the MacX Installer Script icon.

Font Management

=====

MacX supports the traditional view of fonts in X11 (it does not currently give users access to their native Macintosh TrueType or Bitmap fonts). The Easy Install option will install the miscellaneous, 75 dpi, and 100 dpi font directories. You can choose Fonts from the Edit menu in MacX to display a dialog box that lets you modify the default font path. The Fonts dialog box also provides other font utility functions. See the MacX User's Guide for more information.

Other Tidbits

=====

These shortcuts or hints may prove useful:

- To move an X client window that doesn't have a title bar, press the Option key while dragging the window.
- To scroll within a rooted window, press the Option-x keys and the mouse button simultaneously. The pointer changes to a hand, allowing you to scroll through the window.
- To edit a remote command, press the Option key while choosing a command from the Remote menu.

Known Problems

=====

These problems may occur when you use MacX 1.5:

- Built-in window manager (rootless) is missing support for newer ICCCM hints.
- Shaped parent windows don't work very well in rootless mode.
- Color palette management with two Macintosh monitors is less than optimal.
- Switching between the rexec and rsh remote clients may not work.

Known Conflicts

=====

Older versions of MacTCP and Ethernet drivers may occasionally lock up or hang MacX. The maze application may exacerbate this situation due to maze's high packet rates.

Technical Support

=====

Please refer to the MacX documentation for questions about using MacX. If you need additional help, you can call 1-800-SOS-APPL for direct access to support engineers knowledgeable about MacX.

Support is available Monday through Friday, from 6 a.m. to 6 p.m. (PST).

Technical support engineers handle questions about configuration, installation, compatibility, and product use. Technical support engineers do not resolve presale or development questions, nor questions about modified hardware or software source code.

Apple also provides the Apple Tech Info Library (TIL), an excellent online reference source for technical information. You can search through thousands of articles on current and past Apple products. The articles are updated regularly by Apple Support personnel.

The Apple Tech Info Library is available on:

- Internet - <http://www.info.apple.com/til.html/>
- CompuServe - GO APLTIL
- America Online - Select the Keyword command in the GoTo menu (or cmd-K) and enter Apple Computer in the search window.

PowerBook 5300: Portable StyleWriter Compatibilty (4/96)

Revised: 4/25/96
Security: Everyone

PowerBook 5300: Portable StyleWriter Compatibilty (4/96)

=====

Article Created: 8 November 1995
Article Reviewed/Updated: 25 April 1996

TOPIC -----

Is the Portable StyleWriter compatible with the PowerBook 5300?

DISCUSSION -----

Setting Up
=====

Here are the steps to configure your PowerBook 5300 series computer to print to a Portable StyleWriter.

Step 1

Installing the Portable StyleWriter driver with the Installer.

Step 2

Connecting the printer to your PowerBook 5300 series computer with a serial cable.

Step 3

Pull down the Apple Menu and select Chooser.

Step 4

In the Chooser, if you were using LocalTalk, set AppleTalk to Inactive. If you are using EtherTalk or IRTalk, you may keep AppleTalk Active.

Step 5

Select the Portable StyleWriter driver

Step 6

Select the Modem port icon (even though two icons appear, the PowerBook 5300 series computers have only one physical serial port and you need to select the Modem port).

Notes

=====

1. The latest Portable StyleWriter driver shipped by Apple is v1.0.1 and is posted online in all of the available Apple Software Updates areas.

These articles can help you locate the software update mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates.
- Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Article Change History:

22 Mar 1996 - Added information about latest Portable StyleWriter software.

25 Apr 1996 - Removed reference to SerialDMA.

ImageWriter II: Color Printing Not Supported by Driver (5/96)

Revised: 5/6/96
Security: Everyone

ImageWriter II: Color Printing Not Supported by Driver (5/96)

Article Created: 8 November 1995
Article Reviewed/Updated: 6 May 1996

TOPIC -----

I cannot get my ImageWriter II printer to print in color. Color printing is not an option in either the Page Setup, or the Print dialog. How can I get the ImageWriter to print in color?

DISCUSSION -----

Color printing on the ImageWriter II printer is not part of the ImageWriter II Printer Driver. It requires the application you are using to generate the proper commands for color printing. For compatibility information on a particular application, call the vendor of the application.

If you have Quickdraw GX installed, you can print in color from most applications even if the application does not support color printing from the normal imagewriter driver, or is not QuickDraw GX-savvy.

Other Solutions
=====

You may also want to consider a third-party solution such as MacPalette II from Microspot. MacPalette II provides an ImageWriter II printer driver that allows color printing from most applications.

Determining if the Printer is Working Properly
=====

If you generate a test page with the color ribbon installed, you can determine if the printer is printing color properly. The test page will print multi-color letters on the page.

Generating a Test Page

=====

Step 1

Turn the ImageWriter II printer off

Step 2

Hold down the power and form feed buttons

Step 3

Turn the ImageWriter II on, then release the buttons.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

GeoPort 2.3 Telecom Adapter ReadMe (5/96)

Revised: 10/28/96
Security: Everyone

GeoPort 2.3 Telecom Adapter ReadMe (5/96)

Article Created: 8 November 1995
Article Reviewed/Updated: 26 May 1996

TOPIC -----

This article is the GeoPort 2.3 Telecom Adapter Read Me file.

DISCUSSION -----

Software Included in the GeoPort Telecom Adapter Kit

Apple Telecom Software

This includes all software necessary to use the GeoPort Telecom Adapter with the following Macintosh systems:

- Centris 660AV, Quadra 660AV and Quadra 840AV.
- Power Macintosh 6100 series, 7100 series, 7200 series, 7500/100, 8100 series, 8500/120, and 9500 series.

The Apple Telecom User's Guide contains complete information about installing and using this software. An electronic Apple Telecom Upgrade Manual is included in the Telecom Documents folder so that you can learn about the new features if you upgraded electronically and don't have the Apple Telecom User's Guide. Disks 1 and 2 can also be used to install Apple Telecom 2.x software on Macintosh systems equipped with an Express Modem card.

NOTE: For Power Macintosh 7200 series, 7500/100, 8500/120, and 9500 series, version 2.1 or higher of Apple Telecom Software is required. If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any LocalTalk devices attached to the printer port (serial devices can remain attached).

IMPORTANT: If you select "Sleep" from the Special Menu available on some Power Macintosh models while there is an active GeoPort connection, the GeoPort

Telecom Adapter will automatically disconnect the call without warning. When a Power Macintosh 7200 series model is in the low-power mode, the GeoPort Telecom Adapter will wake up the machine if the telephone rings and the machine is awaiting an incoming call. The monitor will remain in the low-power mode. While a connection is open via a GeoPort Telecom Adapter, your Power Macintosh will not enter the low-power mode, but the monitor will dim the screen.

MegaPhone (for United States, Canada, and Japan only)

This is a screen-based telephone application that delivers full support of the telephony capabilities of the Apple Telecom 2.x software, including support for dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information, and voice-mail functions.

The GeoPort Telecom Adapter Kit also includes a free 30-day trial of call logging, MegaDial dialing manager, intelligent synchronization with directory information (saving telephone numbers to a PowerTalk catalog, for example), and other extended capabilities.

See also: the MegaPhone electronic manual included on Disk 3 (Telecom Applications).

NOTE: MegaPhone is not installed by the Apple Telecom Installer program. You must install it separately.

SITcomm SE/GTA (for United States and Canada only)

This is a terminal emulator application. With SITcomm SE/GTA (Special Edition for GeoPort Telecom Adapter), your Macintosh can communicate with a variety of other computers, linked by serial cables or by telephone lines.

With SITcomm you can exchange information with

- A colleague who is using another computer with similar communications software.
- Text-based information and electronic mail services, such as CompuServe or MCI Mail.
- Your company or school's remote minicomputer or mainframe.

See also the SITcomm SE electronic manual included on Disk 4 (Telecom Applications).

NOTE: SITcomm is not installed by the Apple Telecom Installer program. You must install it separately.

NOTE: SITcomm (Disk 4) is not included with free upgrades. You can order the full upgrade, including SITcomm SE and the Apple Telecom User's Guide manual, by calling the Apple Order Center. Ask for the Apple Telecom software version 2.x upgrade for use with your GeoPort Telecom Adapter.

Upgrading From Previous Releases of GeoPort Telecom Adapter Software

=====

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

NOTE: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

When you have installed over an older version, the folders "Modem Documents" and "Express Fax" and the file "GeoPort ReadMe" may still be left on your hard disk from the earlier version. These are not necessary for using the newer version; you may delete them.

Connection (CCL) Scripts for Apple Remote Access

=====

Use the following connection scripts with Apple Remote Access:

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)

ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide. Apple Remote Access 1.0 does not support Power Macintosh computers. You can order an upgrade for Apple Remote Access by calling the Apple Order Center.

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter), you should select one of these connection files in the Apple Remote Access Setup control panel.

NOTE: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Remote Access Dial Back

If your Remote Access server uses a "Dial Back" feature, the server's return call back to your machine may be inadvertently directed to an open telephone application. To avoid this situation, either close these applications or open the Express Modem control panel and choose "Data" as the default call type when you expect an incoming call from another computer.

Using Fax Sender GX with QuickDraw GX 1.1

=====

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex grayscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

NOTE: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk Network

=====

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

NOTE: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

=====

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

NOTE: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

FastPrint

=====

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript printers.

Troubleshooting

=====

Online Services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the GeoPort Telecom Adapter to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying incoming calls

When answering your phone line, the GeoPort Telecom Adapter will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application (such as MegaPhone), we recommend that you select Voice as the default call type. If you are using a data

telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

If you have problems receiving calls from data modems (when using the Apple Remote Access dial back feature, for example), try decreasing the number of rings to Auto-answer in the Express Modem control panel (if permitted in your country). Some calling modems may time out and disconnect before your modem answers if the number of rings is too high.

Removing fax storage folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Using a Centris 660AV or Quadra 660AV/840AV

If you are using a Centris 660AV or Quadra 660AV/840AV and experience errors when attempting to establish a connection, you may need to change the audio settings on your computer. The default setting of 24.000 kHz is compatible with the GeoPort Telecom Adapter. To change this setting, open the sound control panel, choose "Sound Out" and select the "24.000 kHz" sampling rate.

Resetting a blacklisting error message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

Clicking sound from GeoPort Telecom Adapter

If your machine freezes, the GeoPort Telecom Adapter can lose its connection with your machine and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your machine.

Port Selection

=====

The interface for selecting the correct communications port has been simplified since GeoPort Telecom Adapter software versions 1.0.2 (Power Macintosh) and 1.2.2 (660AV/840AV). The "Use internal modem instead of modem port" checkbox has been removed from the Express Modem Control Panel. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually

attached to the Modem port. If so, all serial communications are first processed by the Express Modem software and transmitted through the GeoPort Telecom Adapter. If not, serial communication passes through the modem port directly.

GeoPort has been removed from the list of ports. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. Select Modem Port whenever you wish to communicate through the GeoPort Telecom Adapter.

What goes where
=====

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- GeoPort Telecom Adapter ReadMe
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Gateway manual for users who upgrade electronically)
- About Fax Sender GX (Fax Sender GX manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- GeoPort Telecom ARA 1.x/CNG (optional, transmits data calling tone, 660/840AV only)
- GeoPort Telecom ARA 2.x/CNG (optional, transmits data calling tone)
- Modem AT Command Set

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- AudioTuneUp (9500 series only)
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- GeoPort for Power Macintosh (Power Macintosh only)

- GeoPort Extension (660/840AV only)
- GeoPort Serial Driver
- GeoPort Telecom Adapter
- GeoPort Telephone Tool
- GeoPort Telecom ARA 1.x (Apple Remote Access 1.0 CCL, 660/840AV only)
- GeoPort Telecom ARA 2.x (Apple Remote Access 2.0 CCL)
- Serial Extension (660/840AV and 6100/7100/8100 series only)
- Shared Library Manager
- Telephone Manager Extension

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)
- Electronic Telephone (sound resource)

GeoPort 2.3 and Compatible Computers (11/95)

Revised: 11/9/95
Security: Everyone

GeoPort 2.3 and Compatible Computers (11/95)

=====

Article Created: 8 November 1995

TOPIC -----

This article provides the computers which are compatible with the GeoPort 2.3 Telecom Adapter.

DISCUSSION -----

Following is the list of GeoPort compatible computers from the GeoPort 2.3 Telecom Adapter Read Me:

- Centris 660AV, Quadra 660AV and Quadra 840AV.
- Power Macintosh 6100 series, 7100 series, 7200 series, 7500/100, 8100 series, 8500/120, and 9500 series.

System 7.5.2: Control Strip Software (11/95)

Revised: 11/9/95
Security: Everyone

System 7.5.2: Control Strip Software (11/95)

Article Created: 9 November 1995

TOPIC -----

This article describes the Control Strip software included on the Power Macintosh 7500 and 8500 computers and also installed by the AppleVision 1710 AV Display software.

For information on the Control Strip software on PowerBook computers see the TIL article "PowerBook: Control Strip Software".

DISCUSSION -----

The Control Strip that ships with System 7.5.2 on the Power Macintosh 7500 and 8500 is only supported on these computers. The AppleVision 1710 AV Display also includes the Control Strip software, but only includes modules for controlling the monitor.

The Control Strip by default appears at the bottom left portion of your screen, but can be moved easily to fit your needs. To do this, hold down the option key while dragging the sizing tab.

The location of each function (known as "modules") can be changed within the strip by option-click dragging the module you wish to move to a different position. The strip can be easily re-sized by dragging the sizing tab on the end of the strip.

Modules that appear within the Control Strip are stored in the Control Strip Modules folder of the System Folder. These modules cannot be modified but some applications or developers may provide Control Strip Modules which can be installed in the Control Strip Modules folder. It is important to note that all modules in this folder may not appear in the Control Strip depending on the features of the computer you are using.

The following modules are included in the Control Strip with System 7.5.2 on the Power Macintosh 7500 and 8500 computers:

- AppleTalk Switch

Allows user to switch AppleTalk on or off without going to the Chooser and without restarting.

- File Sharing

Allows user to switch file sharing on or off and change the sharing setup. A red "X" through the File Sharing folder icon usually means AppleTalk was not loaded during startup. To start AppleTalk, select "AppleTalk: Active on restart" in the Chooser and restart the computer.

NOTE: Changing file sharing settings on the Control Strip will only create a temporary change and therefore will return to its original setting once the computer has been restarted. To make the setting permanent, it is necessary to make changes using the Sharing Setup control panel.

- Sound Volume

Allows you to adjust the volume setting of the computer.

- Video Mirroring

Allows you to switch the video mirroring feature on or off. Video mirroring is only available when a television or other NTSC device is receiving video from a Power Macintosh 8500 with 4 MB of VRAM.

The following modules are included in the Control Strip with System 7.5.2 and the AppleVision 1710 AV Display software:

- Monitor Bit Depth

Allows you to adjust the color depth of the monitor.

- Monitor Resolution

Allows you to adjust the resolution on a multiple-scan capable display.

It is also possible to get a description of each module in the Control Strip through Balloon Help. To do this, pull down the Help Menu, choose Show Balloons, and point to the modules one at a time.

At Ease 3.0: Frequently Asked Questions (1/97)

Revised: 1/20/97
Security: Everyone

At Ease 3.0: Frequently Asked Questions (1/97)

Article Created: 10 November 1995
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This article contains frequently asked questions (FAQ) on the At Ease 3.0 software.

Questions answered in this FAQ:

1) I use At Ease 3.0's Restricted Finder. My computer freezes when I drag a file to a Desktop Printer icon. How can I resolve this?

2) I am getting an error message when I try to edit an existing Setup, it states: "The setup <name of setup> is being modified by another administrator. Please try again later." The message occurs AFTER At Ease Setup is open, not before. How do I resolve this?

3) I have created a setup that does not have access to the control panels, yet my users can still increase and decrease the sound volume and the screen brightness using the buttons on the front of the Macintosh/ Performa 5300, 5200, 580, 575, 550, & 520 computers. How can I keep the users from changing these settings?

4) My At Ease workstations do not shut down after clicking on the Shut Down button in the login pane. Instead, the login pane disappears and all I can see is the background pattern with the beach ball cursor spinning counter-clockwise. How can I resolve this?

5) I am using At Ease 3.0's Restricted Finder and it will not mount the MS-DOS floppy disks; instead, it asks to format them. It will mount Macintosh disks. If I switch to the normal Finder it will recognize MS-DOS floppy disks.

6) How do I rebuild the desktop with At Ease running?

7) Students are holding down the space bar at startup to open the Extensions Manager. Then they disable (deselect) At Ease Startup. The next time the computer restarts, it goes straight to the Finder. How can I prevent my students from getting access to the Finder, yet still run System 7.5 and At Ease?

8) How do I add existing documents or new applications to a particular user and not to all users of a setup?

9) A user changed his password, but it only works on the computer he changed it on. Why don't the other computers recognize it?

DISCUSSION -----

1) Question: I use At Ease 3.0's Restricted Finder. My computer freezes when I drag a file to a Desktop Printer icon. How can I resolve this?

Answer: You need to upgrade the Desktop Printing Software to at least version 1.0.3. (The current version is 2.0.1)

You can download Desktop Printing Software 1.0.3 from one of following online locations:

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Apple Software Updates are posted to a variety of online services, please search the Apple Tech Info Library (on the Internet at <<http://til.info.apple.com/>>) by the string "Apple Software Updates" for a current list of online services we post Apple Software Updates to (You can also use the special string: kol to search for this information in the Apple Tech Info Library).

2) Question: I am getting an error message when I try to edit an existing Setup, it states: "The setup <name of setup> is being modified by another administrator. Please try again later." The message occurs AFTER At Ease Setup is open, not before. How do I resolve this?

Answer: Quit At Ease Setup. Hold down the Command (Apple) key and run At Ease Setup again. Continue holding the Command key (except when entering the Admin name/password) until you get the message "Are you sure you want to validate the Users and Setups databases now?" Click on the OK button.

3) Question: I have created a setup that does not have access to the control panels, yet my users can still increase and decrease the sound volume and the screen brightness using the buttons on the front of the Macintosh Performa/LC 580, 575, 550, 520, 5200, 5300, and 5260 computers. How can I keep the users from changing these settings?

Answer: System 7.5 includes a control panel called Button Disabler that can be installed by doing a custom system software install. This control panel has a single check box that, when checked, deactivates the sound and brightness controls on the front of Macintosh computers with built-in controls.

Use the custom install feature of your Macintosh CD to install the Button Disabler control panel, restart your computer, and click to place an X in the box to the left of "Disable Buttons".

4) Question: My At Ease workstations do not shut down after clicking on the Shut Down button in the login pane. Instead, the login pane disappears and all I see is the background pattern with the beach ball cursor spinning counter-clockwise. How can I resolve this?

Answer: You have AppleShare Workstation version 3.6 installed on the workstations. AppleShare Workstation 3.6 comes with AppleShare 4.1 and 4.2. At Ease 3.0 and At Ease for Workgroups 3.0 do not support AppleShare Workstation 3.6.

You have two options:

- Select Shut Down from someplace else. For example, you can log into any Setup/User and choose Shut Down from the Apple menu or the Special menu.
- Revert to a previous version of AppleShare Workstation. To do this, you can custom install the networking software that came with your system software. If you choose this method you will not be taking full advantage of the speed capabilities of the AppleShare 4.1 software.

5) Question: I am using At Ease 3.0's Restricted Finder and it will not mount the MS-DOS floppy disks; instead, it asks to format them. It will mount Macintosh disks. If I switch to the normal Finder it will recognize MS-DOS floppy disks.

Answer: Add the PC Exchange control panel to At Ease by using the Find Items option in At Ease Setup, OR give the Restricted Finder setup access to the Control Panels.

6) Question: How do I rebuild the desktop with At Ease running?

Answer: To rebuild the desktop, the Command and Option keys must be pressed while the Finder is loading. Here are two methods to do this with At Ease running on your computer:

Method A: Rebuilding the Desktop at Startup

Step 1

Start your computer holding down the shift key. Continue pressing the Shift key until you see the message, "Welcome to Macintosh, Extensions off". Release the

Shift key and press and hold the Command and Option keys simultaneously.

Step 2

If you have not used a password to protect the Finder you will go directly to Step 3.

If you have used a password to protect the Finder, you will get a message asking you to enter it in the next screen. Release the Command and Option keys and click OK. Enter your password in the next dialog box and hold down the Command and Option keys while you click OK. Go to Step 3.

Step 3

At the dialog box asking you if you are sure you want to rebuild the desktop, click OK.

Method B: Rebuilding the Desktop While in At Ease

You can rebuild the desktop from within the At Ease panels if you have access to the Go To Finder option under the Special menu.

Step 1

Press and hold the Command and Option keys while choosing Go To Finder from the Special menu.

Step 2

If you have not used a password to protect the Finder you will go directly to Step 3.

If you have used a password to protect the Finder, you will get a message asking you to enter it in the next screen. Release the Command and Option keys and click OK. Enter your password in the next dialog box and hold down the Command and Option keys while you click OK. Go to Step 3.

Step 3

At the dialog box asking you if you are sure you want to rebuild the desktop, click OK.

Note: If you go to the Finder, then go back to At Ease through the Application menu instead of the File menu, and then try to rebuild the desktop using Method B, it does not work because the Finder is still running when you switch back to it.

7) Question: Students are holding down the space bar at startup to open the Extensions Manager. Then they disable (deselect) At Ease Startup. The next time the computer restarts, it goes straight to the Finder. How can I prevent my students from getting access to the Finder, yet still run System 7.5 and At

Ease?

Answer: This issue was fixed in At Ease 3.0. If you are using an earlier version of At Ease, here are two workarounds:

Remove Extensions Manager From the Control Panels folder

Move the Extensions Manager control panel out of the Control Panels folder of your System Folder. This will prevent the Space bar from activating the Extensions Manager at startup.

Users with access to the Finder can still open the Extensions Manager and use it without it actually residing in the Control Panels folder. In other words, moving it out of the Control Panels folder will not disable it entirely, it will only disables using the Space bar to access it at startup.

Remove Extensions Manager From the Extensions folder

You can also remove the EM Extension from the Extensions folder of your System Folder, which also prevents the Space bar from opening the Extensions Manager at startup. If you remove the EM Extension, the Extensions Manager will no longer be functional to any user, even if the user has access to the Finder.

At Ease will NOT let users without Finder access open the Extensions Manager control panel even if they have access to other control panels.

8) Question: How do I add existing documents or new applications to a particular user and not to all users of a setup?

Answer: In the Finder, place the items in that particular user's Documents folder. Here's how:

Step 1

Form the Finder, Open the Documents folder on the At Ease disk.

Step 2

Inside the Documents folder is an individual Documents folder for each user who has logged on to this At Ease disk. Find the user's own folder.

Step 3

Move the documents, aliases, or applications you wish to add to this user's documents panel.

Anything you add to the user's documents folder, including applications, will appear in the user's document panel not the At Ease Items panel.

9) Question: A user changed his password, but it only works on the computer he changed it on. Why don't the other computers recognize it?

Answer: If your workgroup is not on a server, you will have to update each Macintosh in the group separately so they "know" about the new password.

10) Question: The administrator changed the configuration of one of the Setups, then tried to update the other computers. Why didn't the changes show up?

Answer: When you update over the network, each computer will receive the new information. However, At Ease will not reflect the changes on a computer until you Quit and re-launch At Ease on that computer.

Article Change History:

20 Jan 1997 - Added online references.

07 Jan 1997 - Removed Performa 5400 from Button Disabler section.

11 Sep 1996 - Added Performa/LC 5260 and 5400 series computers.

Audio Volume 1.1: Read Me File (11/95)

Revised: 11/10/95
Security: Everyone

Audio Volume 1.1: Read Me File (11/95)

=====

Article Created: 9 November 1995

TOPIC -----

This article contains the ReadMe file from the Audio Volume 1.1 software posted online.

DISCUSSION -----

Important Information About Reinstalling Performa Software

This document tells you how to install the Audio Volume software on your computer after you have reinstalled your Performa software. You need to install the Audio Volume software only after you reinstall Performa software. The Audio Volume software improves sound quality on your computer.

You may want to print this document and keep it with your manuals, since this information may not be in the documentation that came with your computer. After you finish reading this document, choose Quit from the File menu.

Installing the Audio Volume Software

To reinstall Performa software on your computer, follow the instructions in the Macintosh Performa CD booklet, then follow these steps:

Step 1

Insert the disk System Backup Disk: Audio Volume Installer into your floppy disk drive.

Step 2

Find and double-click the Install Audio Volume icon.

Step 3

Follow the instructions that appear on the screen. If you get a message asking you if it's OK to place the Audio Volume software in a folder or to replace an earlier version of the file, click OK. The instructions on the screen let you know when the installer has finished installing the Audio Volume software.

When your computer restarts, the Audio Volume software is installed on your computer. Keep the disk System Backup Disk: Audio Volume Installer in case you ever need to reinstall Performa software again.

ColorSync 2.0 Photoshop Plug-In Modules 1.3: Read Me File (4/97)

Revised: 4/28/97
Security: Everyone

ColorSync 2.0 Photoshop Plug-In Modules 1.3: Read Me File (4/97)

Article Created: 9 November 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article contains the ReadMe file included with the ColorSync 2.0 Photoshop Plug-in Modules 1.3 posted online.

DISCUSSION -----

ColorSync 2.0 Photoshop Plug-In Modules 1.3 Read Me

What are ColorSync 2.0 Plug-In Modules?

The ColorSync 2.0 Plug-In Modules provide an easy way for you to obtain high quality reproduction of color images. Together with the ColorSync 2.0 System Extension and the installed device profiles, the ColorSync 2.0 Plug-In Modules ensure that your color images will be reproduced most accurately on any device. Three Modules (Acquire, Export, and Filter) are available to fit into any type of work-flow, and to provide color matching capabilities to the novice color user as well as to the most demanding color user.

With the Plug-In's you will be able to:

- Accurately print the image viewed on your monitor.
- Accurately print or view the image you have scanned.
- Embed a profile in your image to be specified as the image's source.
- Make color separations for any press printing condition.
- Use your in-house device to preview what your image will look like on the printing press.
- Execute any custom color matching needed.

What are the system requirements?

Before using any of the modules, you should make sure that:

- Your Macintosh has a 68020 or later processor, or a PowerPC 601 or later

processor.

- Your Macintosh is running System Software version 7.1 or higher.
- The ColorSync 2.0 System Extension and ColorSync 2.0 System Profile Control Panel are installed in the Extensions and Control Panels folders, respectively.
- The ColorSync 2.0 (or ICC-compatible) profiles for your peripherals are installed in "System Folder:Preferences:ColorSync Profiles" folder.
- You are using Adobe Photoshop version 2.5.1 or later, or other software that accepts version 4.0 Photoshop Plug-In modules.

How do I install the software?

If ColorSync 2.0 is not already installed on your system, you can download a copy of the ColorSync installer disks from any of the on-line services mentioned at the end of this document. Please follow the instructions that are included on the disk before installing ColorSync 2.0.

The ColorSync 2.0 Plug-In Modules are installed by coping all three into the "Acquire Export" folder in your Photoshop 3.0 Plug-Ins folder. For Photoshop 2.5, copy all three directly into the "Plug-Ins" folder. For other applications that use plug-ins, refer to the documentation that comes with the application.

Important Definitions

Color matching/color reproduction:

The process of making a controlled transformation of color values generated from one device to values intended for another device.

Profile:

A file containing information about the color reproduction capabilities of a device, such as a scanner, a digital camera, a monitor , or a printer. Commonly, two profiles (source and output) are used during a color matching session.

Source profile:

A profile representing a device from which an image was originated. For example, if an image is scanned in, then the scanner profile is the source profile. Or, if an image is created and viewed on the monitor, then the monitor profile is the source profile.

Output profile:

A profile representing a device on which an image is to be outputted. For example, if an image is to be printed on a color printer, then the printer's profile is the output profile. Or, if an image is to be viewed on the monitor, the monitor profile is the output profile.

Proofer profile:

Proofing is the process of using one device to predict the output of an image on another device. A proofer profile represents the device which is used for the prediction. For example, if an image whose output on a color printer is to be proofed on a monitor, the monitor profile will be the proofer profile.

Matching style:

Because of the differences among devices' color capability, different methods exist for applying color matching on an image. The matching style is usually selected according to the content of the image . See below.

Perceptual matching style:

A matching style which gives the most pleasing reproduction given the capabilities of the devices involved. This is the most commonly used style, especially for reproduction of photographic images.

Colorimetric matching style:

A matching style where colors are reproduced exactly the same as the eye can distinguish. This may result in clipping of certain colors which can not be reproduced on a device. Colorimetric matching can further be divided into relative colorimetric matching and absolute colorimetric matching, where relative matching accounts for the ability of the human eye to automatically adapt to the surround white (e.g., white of the paper the image is printed on), and absolute does not. Colorimetric matching is most commonly used for reproducing Logo colors where the exactness of the color is important.

Saturation matching style:

A matching style where the vividness of the image is best preserved. This style is mostly used for reproduction of graphs and pie charts.

Matching quality:

The matching quality indicates the overall computation precision of a particular matching session. Higher computation precision requires more run-time memory. It is always best to use the highest matching quality your system allows.

Using the Acquire Module:

The Acquire Module will import a Tiff image from disk into Photoshop while applying ColorSync matching. The Acquire Module is most convenient to use if you simply want to match your image for printing from Photoshop, or if you want to match an image you scanned previously for viewing.

To use the Acquire Module:

Step 1

In Photoshop, select the "Tiff with ColorSync Profile..." from the "Acquire" menu under "File". A standard file selection dialog box appears prompting you to select a Tiff image to be imported.

Step 2

Select the Tiff image you want to import and click the "Open" button. The ColorSync Acquire Module dialog box appears. Select the appropriate "Source" and "Output Profile" for the image, and select the desired "Matching Style" and "Quality" setting. Refer to the "Important Definitions" section above for more explanations .

Step 3

Click the "Import" button to start importing.

Note 1: If the Tiff image to be imported already has a profile embedded, the embedded profile will show up on the list of available Source Profiles as an *Italic* item.

Note 2: Only profiles whose color space information match that of the selected Tiff image appear in the list of "Source Profiles". Therefore, for a Tiff CMYK image, only profiles that are CMYK based are available as "Source Profile".

Note 3: Certain Tiff images cannot be imported if they contain unsupported Tiff image format features such as compression.

Using the Filter Module:

The Filter Module will apply ColorSync matching on the current Photoshop image. The Filter Module is most convenient for matching an image which is already in Photoshop without writing it to disk.

To use the Filter Module:

Step 1

In Photoshop, select the "ColorSync Filter" in the "Color Matching" menu under "Filter". The ColorSync Filter Module dialog box will appear.

Step 2

Select the appropriate "Source" and "Output Profile" for the image, and select the desired "Matching Style" and "Quality" setting. Refer to the "Important Definitions" section above for more explanations.

Step 3

Click the "OK" button to start filtering.

Note: Due to limitations of the Photoshop Filter Module API, the ColorSync Filter Module can only match images from/to the same color space. Therefore, it cannot match an RGB image for a CMYK device, and vice versa.

Using the Export Module:

The Export Module will save the current Photoshop image to disk as a Tiff image with ColorSync matching applied. It is the most flexible module out of the three.

To use the Export Module:

Step 1

In Photoshop, select the "Tiff with ColorSync Profile..." module from the "Export" menu under "File". The ColorSync Export Module dialog box will appear.

Step 2

Select the desired choice from "Processing Selection". Action for each of the choices are as follows:

- "Embed" simply embeds into the current image the selected "Source Profile" with the selected "Matching Style". No color matching occurs.
- "Match" applies a matching session using the selected "Source" and "Output Profile" and the selected "Quality" and "Matching Style". The "Output Profile" is also embedded in the output image to indicate that the matched image is now intended for the device associated with the profile.
- "Proof Matched" applies a proofing session using the selected "Source", "Output", and "Proofer Profile" and the selected "Quality" and "Matching Style". "Matching Style" is applied separately for the source-to-output match AND for the output-to-proof match. The "Proofer Profile" is also embedded to indicate that the matched image is now intended for the device associated with the profile.
- "Custom" enables more extensive matching sessions.

Click the "Export" button if "Embed", "Match", or "Proof" is selected and go to step 6. Click the "Select..." button if "Custom" is selected and go to step 3 below.

Step 3

"Custom" matching is used for the rare occasion when you want to perform matching with many profiles. It comes up with a dialog box with a scrollable list of "Profiles Selected" and a "Quality" selection that is to be applied for the entire matching session.

Step 4

Click the "Add Profile" button to add a profile after the last element on the "Profiles Selected" list. This brings up the list of available profiles. Select the desired profile and the "Matching Style" setting and click the "Add" button. The "Matching Style" selecting is applied for the match from the current profile to the next selected profile. The "Matching Style" of the last selected profile is ignored.

Step 5

Repeat step 4. as many times as necessary to add more profiles to the list. When done, click the "Export Tiff..." button. To remove a profile from the list, all succeeding profiles following that profile must be removed first. To remove the last profile from the list, simply select the profile and click "Remove Profile".

Step 6

The standard save file dialog box will appear prompting for a name of the image file to be saved as. Enter the desired file name and click the "Save" button to execute.

Note: An image must be loaded in RGB or CMYK mode in order for the "Tiff with Color Sync Profile" menu item in the Export menu item to be selectable. The item is not selectable if the image is in indexed mode.

Where do I go for more information?

Power Macintosh: Type 11 & No FPU Errors Technote (7/96)

Revised: 7/3/96
Security: Everyone

Power Macintosh: Type 11 & No FPU Errors Technote (7/96)

=====

Article Created: 10 November 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This Technote explains some of the causes of "Type 11" and "No FPU Installed" errors, along with debugging hints to help you find and fix them. It also focuses on what you as a programmer can do to prevent such errors.

DISCUSSION -----

Both Type 11 and No FPU Installed errors occur on Power Macintosh computers, depending on various factors. Both error messages are the result of programming errors. The No FPU Installed error usually means that your program is executing data rather than instructions. The Type 11 error is any error (such as a bus error) in native code.

NOTE: In this Technote, I will occasionally mention third-party products by name. If a third-party product is mentioned by name, it's meant to be a possible solution for you to investigate, not a recommendation. DTS doesn't evaluate third-party tools, nor maintain complete lists of possible third-party solutions. You should consult catalogs of development tools such as:

- Macintosh Development Tools & Languages
- the Redgate Macintosh Registry
- the ubiquitous Internet
- the APDA catalog and
- reviews in technical magazines to find a product that fits your needs.

There are many Web sites on the Internet -- for example, Apple's Third-Party Development Products Database at http://www.info.apple.com/dev/thirdparty/third_party.html lists many Macintosh development tools. Perhaps you may find an appropriate tool to meet your development needs in this way.

About "No FPU Installed" Errors

=====

On a Power Macintosh computer, the error message No FPU Installed usually means your code has jumped to a non-code area and is executing garbage. Somewhere in that data (which is being interpreted as instructions) is an instruction whose op code begins with the hex value F. No FPU Installed is equivalent to a Type 10 Error -- i.e., your program has attempted to execute an unknown instruction op code starting with the hex value F.

On a Power Macintosh, No FPU Installed means that some program has jumped to an area of data and has tried to execute any data word starting with the hex value F. The PowerPC chip has floating point support built in, but that floating-point support is different from the Motorola 680x0 family floating-point support. The Motorola 680x0 family uses an external floating-point unit. (There are also external memory management units (MMUs) and other specialized coprocessors.) Motorola 680x0 CPUs use instructions starting with hex value F as instructions for these coprocessors.

680x0 Microprocessor Instructions

All Motorola 680x0 microprocessors have instructions consisting of at least one word (the operation word); some instructions can have up to eleven words (see the Motorola MC68020 32-bit Microprocessor User's Manual, Third edition, page 3-1.) The operation word determines what kind of instruction is to be executed. For example, the instruction

```
MOVE.B D1, D2
```

translates to the hexadecimal value

```
1401
```

This instruction starts with the hex value 1. The instruction

```
FMOVE.X    FP3,-(A7)
```

translates to

```
F227 6980
```

This instruction starts with the hex value F.

F-line Instructions

The Motorola 680x0 architecture was originally designed to support a floating-point coprocessor chip. This chip, the Floating Point Unit (FPU), communicates with the CPU via a special set of instructions called F-line instructions. These instructions always start with an operation word beginning with the hex value F.

A program can be compiled to take advantage of the hardware assistance the FPU provides, and thus yield faster floating-point calculations than would be available with SANE (the Standard Apple Numerics Package). Such programs would

have instructions in the program which start with the hex value F. A program only using SANE would never have an instruction starting with the hex value F.

NOTE: Some Macintosh models, such as the Macintosh SE/30, the Macintosh IIfx, and the Macintosh IIfx, shipped with an FPU coprocessor installed. Other 680x0-based Macintosh computers, such as the Macintosh IIsi and the Macintosh Color Classic, had an optional FPU coprocessor. For these machines, it was possible to purchase an optional card with an FPU coprocessor.

68040 & 68040LC Microprocessors

With the introduction of the 68040 and 68040LC chips, things got a bit more complicated. The 68040 microprocessor has most of the 68882 FPU included on the chip. Not everything in the 68881/68882 FPU is in the 68040 chip, however -- just the routines that Motorola determined were most frequently used. The rest of the FPU routines are automatically emulated by software. Because the FPU is "built-in," as it were, the 68040 chip handles instructions that start with an operation word beginning with the hex value F by itself. There is no way to add a coprocessor to a 68040 chip; the instructions are never brought out of the chip itself.

The 68040LC is a cost-reduced version of the 68040 chip. Savings came about by removing the FPU portion of the chip. Not only does a 68040LC chip have no FPU, there is no way to add one.

The Power Macintosh

Power Macintosh computers emulate a Motorola 68040LC, i.e., a machine without FPU support. When you get a bomb with the message No FPU installed, it means some instruction has been executed with an operation word starting with the hex value F, and that your program is running on a machine without a FPU. This machine could be one of the following:

- a Macintosh with a 68020 or 68030 microprocessor and no FPU coprocessor
- a Macintosh with a 68040LC microprocessor (which can never have a FPU)
- a Macintosh with a PowerPC chip running 68K code in emulation (since the 68K emulator emulates a 68040LC microprocessor).

Power Macintosh computers contain very fast floating-point support as part of the CPU. This floating-point support is different from the floating-point support provided by the Motorola 680x0 microprocessors. Inside Macintosh:PowerPC Numerics, describes Power Macintosh floating-point support.

Defining a Type 11 Error

A Type 11 error means an illegal interrupt vector on a 680x0 machine. On a Power Macintosh, a Type 11 error is any exception in native code not handled by one of the installed exception handlers. On a Power Macintosh, a Type 11 error can be almost any error that occurred in native code. Type 11 errors may include:

- an address error
- a bus error

- an illegal instruction error that occurred in native code.

The exception handlers installed for native code don't correctly handle the particular condition which was raised, and the error is returned back to the System Error manager via the Mixed Mode manager. The System Error manager maps all such exceptions to the system error Type 11 Error.

If you install Macsbug 6.5.2 or later, some Type 11 errors may be reported as a PowerPC unmapped memory exception. This is equivalent to a bus error, i.e., an error indicating your program is accessing memory that doesn't exist.

The Modern Memory Manager was designed to be less forgiving than the classic (68K) Memory Manager. Disposing of something twice, disposing of memory that was never allocated, and other memory handling problems will often generate a Type 11 error, while on a 68K machine the problem may go unnoticed.

Programming Mistakes Causing Type 11 Errors

=====

The following sections give you examples of programming mistakes that may cause Type 11 errors.

Example #1: Writing Past the End of an Array

Writing past the end of an array can be a subtle and difficult-to-find bug.

Example #1 shows you why.

Begin_Table

```
=====
;Begin C Code
;
void IAmGoingToCrash(void)
{
    Str27    badArray;
    BlockMoveData("\pThis string is too long for this array", badArray, 39);
}
;
;End C Code
=====
```

End_Table

NOTE: I've made the bug very obvious; it may not be quite so obvious, however, in your code. In this example, I've put a string of 39 characters into an array defined to hold 27 characters. This overwrites the stack, which contains such useful things as your return address. On a 68K Mac, this causes a bus error. On a PowerPC Mac in 68K emulation, this causes a bus error. On a Power Macintosh in native code, this causes a Type 11 error.

Example #2: Using a Poorly Initialized Pointer or Handle

If your program tries to use an uninitialized or badly initialized pointer, it

can generate a Type 11 error. Here is what happens in Example #2:

```
;=====
;Begin C Code
;
Ptr badPointer = (Ptr)-2;
*badPointer = 0;
;
;End C Code
;=====
```

End_Table

NOTE: I've made the bug very obvious; it may not be quite so obvious, however, in your code. In this example, I've created a pointer to non-existent memory (-2 isn't a valid address) and then tried to access the memory to which the pointer refers. On a 68K Mac, this causes a bus error. On a PowerPC Mac in 68K emulation, this also causes a bus error. On a Power Macintosh in native code, this causes a Type 11 error.

Other Situations Causing Type 11 Errors

=====

The following sections document some of the known bugs in various products that may cause Type 11 errors.

Color Picker vs Third-Party SCSI Drivers

One reproducible problem stems from a known bug in several third-party SCSI hard disk drivers. The bug causes the Color Picker to crash when trying to resolve a boot volume alias it makes at startup time. This problem exists in any system when Color Picker 2.0 or 2.0.1 is installed and the boot volume is not a removable drive. The fundamental cause of the problem is that the SCSI driver incorrectly marks the boot drive as a removable drive during the boot process and changes it to be properly marked as a fixed device after startup. To find its code, the Color Picker resolves the boot volume alias it made during startup. Since the alias passed to the Alias Manager is for a removable drive, the Alias Manager can't resolve the alias (since the device is now marked as fixed.) The Color Picker design did not anticipate the boot volume not being found. This results in a Type 11 error. The fix is to upgrade your SCSI driver to a later version.

Calling a Routine That May Move Memory at Interrupt Time

The Apple Media Kit, release 1.2, had a problem that could cause random errors. During a VBL task, AMK was calling SetCCursor. SetCCursor can possibly move memory. Moving memory during interrupt time is a very bad idea. The Memory Manager may be in an unstable state, such as compacting memory, when an interrupt routine gets called. This can cause a Type 11 error in native code.

A replacement cursor.c file has been provided in the Apple Media Tool/Programming Environment Runtime folder, and we do have a replacement Runtime Maker:Codes:Program file for Apple Media Tool. If you are currently

developing titles, replacing these files and rebuilding your projects will remove the bug.

Not Enough Heap Space

There are some situations where having small amounts of memory available in the system heap may lead to a Type 11 error. As an example, if the shared library manager can't load a shared library, you may get a Type 11 error. This can happen when QuickTime tries to load a decompressor for certain kinds of images.

Writing Past the End of an Array

In OpenTransport 1.0.5 or earlier, there was a bug in the TCP/IP control panel code that could corrupt memory if there were more than 256 zones and a MacIP server was found in a zone past the 256th zone. Under these conditions, the control panel code wrote past the end of one of its buffers. This bug would manifest itself if the user opened the select zone dialog and the TCP/IP control panel was left open long enough for the NBP lookup calls for zones past the 256th zone to complete. This is corrected in OpenTransport 1.0.6 and later, but is given here as an example of a Type 11 error.

Insufficient Stack Space

Heavy use of local variables or recursion may cause your program to run out of stack space. When this happens, you may have crashes that are difficult to track down. Increasing your program's stack is one solution. Whenever you are using a large number of local variables or recursive routines, you should increase your program's stack (using the procedure listed in Inside Macintosh: Memory on page 1-40).

As an extreme example, a faceless background application (documented in Technical Note PS 2) has only a 2K stack by default. A 68K application has 24K of stack on most modern machines (8K if no Color QuickDraw is installed, 32K if A/UX is installed.) You can use the low memory accessor function LMGetDfltStack to find your current stack size. Native QuickDraw has several changes in algorithms that have increased the size of some structures. PowerPC alignment issues may cause the size of data structures to increase. Check your compiler documentation for further details.

To help detect collisions between the stack and the heap, a "stack sniffer" VBL task is installed that compares the current ends of the stack and heap and generates a system error 28 in case of a collision. Unfortunately, the Thread Manager is forced to disable the stack sniffer whenever it is installed. (This is because threads can have a stack in places where the stack sniffer doesn't expect them; if the stack sniffer is enabled, it would generate a system error 28.) This means you don't have the same level of protection as you did under older system software versions without the Thread Manager installed.

Too Much Recursion in QuickDraw

Native QuickDraw before version 2.4.1 used a recursive routine to handle regions. This recursive code could cause your stack to run into the heap when handling certain region shapes. Version 2.4.1 of QuickDraw changed to a

non-recursive routine which eliminates this error. (You can detect the version of QuickDraw using the Gestalt selector 'qd 'which returns a version.) In general, recursion on PowerMacs is dangerous unless you have substantial stack space available; PowerPC stack frames are very large, and putting many of them on the stack may quickly exhaust available stack.

Interrupts Not Handled by Device Drivers

Some Type 11 errors may legitimately be illegal interrupt vector errors, rather than simply unhandled exceptions in native code. If a device driver for a NuBus or PCI card does not install an interrupt service routine, but the card raises an interrupt, you will receive a Type 11 error. This will happen whether you are running in 68K code or PowerPC code. The only solution for such a problem is to update the driver to correctly handle the interrupt issued by the card.

Other Programming Errors

Common programming errors may cause Type 11 or No FPU Installed errors. These include the same kinds of errors that usually result in address errors on 680x0-based Macintosh computers. For example:

- Indexing through an array incorrectly so that your program goes outside the memory allocated for that array (as demonstrated above).
- Disposing of memory twice
- Disposing of memory that was never allocated
- Calling DisposeHandle on a resource handle (use DisposeResource instead, to ensure that the Resource Manager doesn't lose handles behind its back.)

Some Techniques To Help Avoid Type 11 Errors

The following techniques may help resolve situations that might lead to Type 11 errors:

- Test your code carefully.
- Install the Debugging Modern Memory Manager, available on the Tool chest Developer CD. This version of the Modern Memory Manager has additional checks installed which allow you to track down and eliminate many memory management bugs.
- Use extensions such as EvenBetterBusError (found on the Tool chest Developer CD) in conjunction with Macsbug 6.5.2 or later, to detect use of uninitialized pointers or handles.
- Use third-party testing tools such as QC™ by Onyx or MemoryMine™ by Adianta.

IMPORTANT: It goes without saying that good testing before you release a product will prevent expensive customer support calls later on.

User-Level Recommendations

Here are some user-level suggestions recommended by Apple for unexplained Type 11 or No FPU installed errors:

1. Upgrade your hard disk driver(s) to the latest version available. There are

some known problems between SCSI Manager 4.3 and some SCSI disk drivers. Starting with System 7.5, the SCSI Manager 4.3 is installed on all Macintosh Quadras and Power Macintosh computers. There are some known programming problems in some older third-party disk drivers.

2. Upgrade to the latest System Software appropriate for your system. Several significant bug fixes in system updates should reduce the number of Type 11 and No FPU Installed errors you encounter.

3. Do a clean install of your System Software. Use the Extensions Manager control panel to determine if any additional control panels or extensions are conflicting with your system software.

4. Some Type 11 errors may result from corrupted PRAM. Unfortunately, most of extended PRAM is undocumented. (See Inside Macintosh:Operating System Utilities, chapter 7, Parameter RAM Utilities, for what details are documented.) You can restore your default PRAM values by holding down Command-Option-P-R at system startup time, or by using a shareware utility such as TechTool.

5. Make sure you are not using composite RAM in a Power Macintosh. Memory specifications are in the developer hardware notes for each computer.

6. Some users claim that installing the shareware extension SoftwareFPU cuts down on No FPU Installed problems. This extension emulates the Motorola FPU (at a considerably slower speed), thus preventing bombs from software which incorrectly makes FPU calls. This may alleviate no FPU Installed errors, but it doesn't address the fundamental problem, namely that some software is executing unexpected data or making illegal calls to a non-existent FPU.

7. Upgrade any software you find that causes repeatable errors.

Summary

=====

There are no easy solutions for handling Type 11 Error or No FPU Installed errors. Only careful debugging and testing can reduce the number and frequency of these errors. Most problems stem from common programming errors.

Color LW 12/600 PS: Using Special Features in Windows NT (11/95)

Revised: 11/27/95
Security: Everyone

Color LW 12/600 PS: Using Special Features in Windows NT (11/95)

Article Created: 13 November 1995
Article Reviewed/Updated: 27 November 1995

TOPIC -----

I need to setup fonts, margins, watermarks, and print quality for the Color LaserWriter 12/600 PS printer. My Color LaserWriter 12/600 PS is connected to a Windows NT computer, and since the Apple LaserWriter Utility does not work on Windows NT, how do I change these things?

DISCUSSION -----

For these particular options you do not need the Apple Printer Utility, they can be done on a per job basis from either Windows NT, the client sending the print job, or the application that is printing the job. If you need to use the Apple Printer Utility, you can use this utility from a Macintosh using AppleTalk, or a Windows client directly connected to LPT1 or connected using Netware.

Font Sets

From Windows NT, open the Color LaserWriter 12/600 PS driver ICON. Select Properties from the first menu. Select setup, font substitution. Also on a per job basis from a remote client, from the application the customer may select Print Setup, Options and Fonts for full font control.

Print Quality

From Windows NT open the Color LaserWriter 12/600 PS driver ICON. Select Properties from the first pull down menu. Select details, job defaults, options. Also be aware that If you are printing from a remote client you have options from the Control Panel for Print Setup, and you may also have the some options built into the application you are printing from.

Margins

Setting margins is not usually an option in the driver, these are handled by the

application you are printing from.

Watermarks

Watermarks are supported from the Windows NT spooler, but can be selected from the client once again from the application select Print Setup, Options and Watermarks.

Color StyleWriter: Using Iron-on Transfer Paper (11/95)

Revised: 11/13/95
Security: Everyone

Color StyleWriter: Using Iron-on Transfer Paper (11/95)

=====

Article Created: 13 November 1995

TOPIC -----

Can images printed on the Color StyleWriter 2200, 2400, and Color StyleWriter Pro printers be transferred to fabric?

DISCUSSION -----

Transfer paper are special purpose papers that can be used to transfer images from a printed page to another surface such as a shirt. Apple does not supply or test transfer papers on our printers, however there are third-party companies that supply products which should be compatible.

Canon sells special transfer paper for their line of MS-DOS/Windows color ink-jet printers which, due to the design similarities with the Color StyleWriter series of printers, should produce acceptable results when used with the Color StyleWriter 2200, Color StyleWriter 2400, and Color StyleWriter Pro.

Under normal conditions the inks used in the Color StyleWriter 2200, Color StyleWriter 2400, and Color StyleWriter Pro are water soluble. This makes them poor candidates for transferring images to cloth, since you would normally wash the cloth. However, Canon sells a special coated transfer paper that can be used to transfer image to fabric. In order to permanently set the water-soluble ink into the fabric the cloth is dipped into a vinegar solution using the instructions provided with the paper.

Canon's transfer paper does not require any special ink and can be ordered directly from Canon's consumer supplies group at (800) 671-1090. The Canon T-shirt Transfer Paper part number is TR101.

AppleScript: Recompile Script After Recording (11/95)

Revised: 11/13/95
Security: Everyone

AppleScript: Recompile Script After Recording (11/95)

=====

Article Created: 13 November 1995

TOPIC -----

I recorded a script in the AppleScript Script Editor, and it worked properly within the Script Editor. However, after I saved the script as an applet, the script no longer works. When the applet is launched, it opens, but does not perform any actions, then quits. Why is this happening?

DISCUSSION -----

This is a currently known problem. A recorded script must be checked before saving. After recording is finished, select and retype any character of the script. This enables the check button in the Script Editor window. Check the script before saving as an applet.

To fix a recorded script applet showing this problem, reopen the script in the Script Editor, make a change to the script text and check the script before resaving.

Color StyleWriter 2400: Serial Number Location (11/95)

=====

Article Created: 13 November 1995

TOPIC -----

This article describes the location of the serial number on the Color StyleWriter 2400 printer.

DISCUSSION -----

The serial number on the Color StyleWriter Printer is located under the paper receiving tray. To locate the serial number, turn the printer over and pull out the paper receiving tray. The serial number usually starts with the letters CE or CC.

Power Macintosh: No FPU Installed Error (11/95)

Revised: 11/20/95
Security: Everyone

Power Macintosh: No FPU Installed Error (11/95)

Article Created: 13 November 1995

TOPIC -----

I have a Power Macintosh computer, and I get errors stating that the FPU is not installed. What is wrong? I thought I had an FPU. Is there any way to check to make sure that it is there?

DISCUSSION -----

Your PowerPC microprocessor has an FPU (floating-point or math co-processor) installed. The FPU is incorporated within the PowerPC microprocessor itself and is part of the basic specification of the computer.

An "FPU not installed" error is software-related and can occur in two ways:

1. You are attempting to use a program which is running in emulation mode and which requires a floating-point unit. The emulation mode in Power Macintosh computers does not simulate a floating-point unit. Many applications check for the presence of a math co-processor before attempting to use it. However, if the application does not check for a math co-processor and attempts to use one, then you get the "No FPU installed" error.

The solution is to update your software with a version that is Power Macintosh-native. In some cases, you may be able to use third-party products which provide a software-based FPU.

2. You are running software--either emulated or native--which is failing. For a variety of reasons, the error message is coming across as an "FPU not installed" error.

The solution, in this case, is to locate which software (such as extensions, control panels, drivers, or applications) is causing the error, and either contact the publisher for compatibility information, or do not use it.

Sound & Displays Control Panel: Common Problems & Solutions 5/96

Revised: 9/23/96
Security: Everyone

Sound & Displays Control Panel: Common Problems & Solutions 5/96

Article Created: 21 August 1995
Article Reviewed/Updated: 31 May 1996

TOPIC -----

This article addresses common problems with the Sound & Displays control panel which is part of System 7.5.2 for the Power Macintosh 7500 and 8500 computers. As of January 1996, no other Macintosh computer uses the Sound & Displays control panel, including the Power Macintosh 7200 series or Power Macintosh 9500 series which also ship with System 7.5.2.

Issues covered in this article:

- (1) "Sound & Displays cannot operate correctly" message.
- (2) "Sound & Displays cannot be used at this time" message.
- (3) "This port cannot be deactivated" message.
- (4) "This port cannot be activated" message.
- (5) Computer Speaker option is automatically unchecked when I restart.
- (6) Audio compact discs do not play.
- (7) Unable to locate the AppleVision Setup control panel.
- (8) AppleVision options do not appear in Sound & Displays control panel.

DISCUSSION -----

1) "Sound & Displays cannot operate correctly" message

Issue: When I try to open the Sound & Displays control panel, an error message says, "Sorry... Sound & Displays cannot operate correctly on this Macintosh. Please consult your Sound & Displays documentation for a description of what

your Macintosh needs for Sound & Displays (Quit)".

Resolution: The Sound & Displays control panel requires AppleScript in order to operate properly. Make sure AppleScript has not been disabled by opening the Extensions Manager in your Control Panels folder under your Apple Menu. If there is not a check to the left of the AppleScript Extension, click on the extension to put a check there, close the Extensions Manager, and restart your computer.

If the Sound & Displays control panel still fails to launch, you should reinstall AppleScript by using the "Apple Macintosh CD" that came with your computer:

Step 1

Double-click the installer located in the Install System Software folder of the disc.

Step 2

Click on the Easy Install pop-up menu and choose Custom Install

Step 3

Click the triangle next to Utility Software, check the box to the left of AppleScript, and then click Install.

2) "Sound & Displays cannot be used at this time" message

Issue: When I try to open the Sound & Displays control panel, an error message says, "Sorry... Sound & Displays cannot be used at this time. The required extensions cannot be found. These extensions have either been disabled or are not present. To use this application, first put the Sound & Displays extensions in your extensions folder, and then restart your Macintosh."

Resolution: The Sound & Displays extensions are "AVSetup" and "SystemAV". There is no file called "Sound & Displays Extension". Although these files are stored in the Extensions Folder, they are not listed by the Extensions Manager control panel. However, they are listed by some third-party extension-managing software (such as Conflict Catcher). Make certain these two extensions have not been disabled or removed from the Extensions folder. If these extensions are missing, reinstall the system software using the "Apple Macintosh CD" that came with your computer:

Step 1

Double-click the installer located in the Install System Software folder of the disc.

Step 2

Click Install.

Step 3

When the installation is complete, quit the installer, and restart your computer to load the newly installed extensions.

3) "Port cannot be deactivated" message

Issue: When I try to deselect one of the options under Sound Input, I get the error message, "This port cannot be deactivated."

Resolution: You cannot uncheck a Sound Input source, because then you would not have any Sound Input source. The way to uncheck a particular source is to check one of the other two sources. The three sources available are External Audio Input, Internal CD, and External Microphone.

(4) "This port cannot be activated" message

Issue: When I try to check External Microphone under Sound Input, this error message appears, "This port cannot be activated."

Resolution: When Speech Recognition is turned on, it locks the Sound Input so that the Sound Input cannot be changed. Turn Speech Recognition off by opening the Speech control panel, choosing Speakable Items from the popup menu, and clicking the OFF button.

If you want to use Speech Recognition, first select External Microphone in the Sound & Displays control panel, and then open the Speech control panel to turn Speakable Items on.

5) Computer Speaker option is automatically unchecked when I restart

Issue: Every time I start up my computer, the option for "Computer Speaker" under "Sound Output" is unchecked. I click to check it, and then I get sound out of my internal speaker. However, the next time I start up my computer, the "Computer Speaker" option is unchecked again.

Resolution: When you start up your computer, it checks to see if anything is plugged into the speaker port (such as headphones). If something is plugged in, the operating system will automatically check "External Headphones" and uncheck "Computer Speaker" under Sound Output. You can override these settings by clicking the desired output option, but the setting is not saved between restarts.

6) Audio compact discs do not play

Issue: I cannot play audio compact discs. I can mount audio CD-ROM discs, and see the counter working in the AppleCD Audio Player, but I hear no sound. I can hear audio from multimedia CD-ROM discs and alert sounds without any problems.

Resolution: This is an issue involving accessing sound options while running Speech Recognition. When you turn Speech Recognition on, it "listens" for commands captured by the microphone. Because of this, Speech Recognition will not allow you to select the Audio CD as the input source. Therefore, you cannot play an audio compact disc through your internal speakers while speech recognition is turned on. Turn Speakable Items off in the Speech control panel and then select Audio CD as your sound input source in the Sound & Displays control panel.

7) Unable to locate the AppleVision Setup control panel

Issue: I have successfully installed the AppleVision software that came with my AppleVision 1710AV display, but I am unable to locate the AppleVision Setup control panel. I am using a Power Macintosh 8500. What do you recommend?

Resolution: AppleVision Setup does not appear as a separate control panel on either the Power Macintosh 8500 or 7500 series computers. If you have installed the AppleVision software, the settings options found in the AppleVision Setup control panel are automatically incorporated into the Sound & Displays control panel.

To access the configuration options for an AppleVision 1710AV monitor connected to either the Power Macintosh 7500 or 8500, follow these steps:

Step 1

Choose the Sound & Displays control panel from the Control Panels folder under your Apple Menu.

Step 2

In the lower right corner of the Sound and Displays control panel in the Displays option section, double-click the text "AppleVision 1710AV".

Although the interface may be slightly different than described in your AppleVision manual, you can now access the same options mentioned in the documentation for the AppleVision Setup control panel.

8) AppleVision options do not appear in Sound & Displays control panel

Issue: The AppleVision options do not appear in the Sound & Displays control panel.

Resolution: The ADB (keyboard) cable is plugged directly into the computer. Plug the ADB cable into the monitor, and connect an ADB cable from the monitor to the computer's ADB port.

Performa 6200CD: No Sound From Internal GV Modem (11/95)

Revised: 11/16/95
Security: Everyone

Performa 6200CD: No Sound From Internal GV Modem (11/95)

=====

Article Created: 13 November 1995
Article Reviewed/Updated: 14 November 1995

TOPIC -----

I have a Performa 6200CD with an internal Global Village modem. Whenever I use it to either fax a document or connect to an online service, I do not hear the modem dialing or connecting. However the modem does allow me to fax and I can connect to online services.

I have had the modem replaced, but the replacement still does not make sounds. What is wrong?

DISCUSSION -----

The Macintosh Performa 5200, 5300, 6200, and 6300 series computers requires additional software to make the modem sounds most people are used to hearing. Unlike external modems, the internal Global Village TelePort Gold IIv and TelePort Platinum V modems do not have a speaker on them. Two extensions, Audio Volume Extension and Internal Modem Sound extension, were developed to use the Macintosh speaker in place of a modem speaker.

The Audio Volume extension is the newer of the two extensions and can be used with any of the Macintosh Performa computers that use Internal Global Village TelePort modems.

You can get the Audio Volume extension from online services where Apple provides software updates.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the

Apple Tech Info Library.

Article Change History:

AppleShare: Cannot Resolve Server Volume Alias (11/95)

Revised: 11/14/95
Security: Everyone

AppleShare: Cannot Resolve Server Volume Alias (11/95)

=====

Article Created: 14 November 1995

TOPIC -----

When I double click on an alias I get a dialog box indicating that the alias cannot be resolved. When I click OK, the volume that the alias points to is mounted anyway.

I use the chooser to mount a server volume. If I then try to create an alias I get a -50 error.

DISCUSSION -----

A newer ROM set, which shipped in the Power Macintosh 7200, 7500, 8500, and 9500, has changes that can affect some third party disk drive partitioning software. The alias issue described above is an example of this. If you are experiencing these errors, contact the manufacturer of the disk drive partitioning software for an updated version. This issue is known and has been corrected in newer versions of partitioning software.

Audio Volume Read Me (11/95)

Revised: 11/14/95
Security: Everyone

Audio Volume Read Me (11/95)

=====

Article Created: 14 November 1995

TOPIC -----

This article is the Audio Volume Read Me file.

DISCUSSION -----

This software replaces the Internal Modem Sound extension 1.0 that lets an internal Global Village modem sound play through internal speaker. The Audio Volume extension supports 16-Bit audio capable Performa 5200, 5300, 6200, and 6300 computers with an internal Global Village modem.

Audio Volume Read Me
=====

Important Information About Reinstalling Performa Software

This document tells you how to install the Audio Volume software on your computer after you have reinstalled your Performa software. You need to install the Audio Volume software only after you reinstall Performa software. The Audio Volume software improves sound quality on your computer.

You may want to print this document and keep it with your manuals, since this information may not be in the documentation that came with your computer. After you finish reading this document, choose Quit from the File menu.

Installing the Audio Volume Software

To reinstall Performa software on your computer, follow the instructions in the Macintosh Performa CD booklet, then follow these steps:

- 1) Insert the disk System Backup Disk: Audio Volume Installer into your floppy disk drive.

- 2) Find and double-click the Install Audio Volume icon.
- 3) Follow the instructions that appear on the screen. If you get a message asking you if it's OK to place the Audio Volume software in a folder or to replace an earlier version of the file, click OK. The instructions on the screen let you know when the installer has finished installing the Audio Volume software.

When your computer restarts, the Audio Volume software is installed on your computer. Keep the disk System Backup Disk: Audio Volume Installer in case you ever need to reinstall Performa software again.

Performa: MacTCP 2.0.4 to MacTCP 2.0.6 Update Issue (11/95)

Revised: 11/14/95
Security: Everyone

Performa: MacTCP 2.0.4 to MacTCP 2.0.6 Update Issue (11/95)

=====

Article Created: 14 November 1995

TOPIC -----

I have a Performa, and the MacTCP 2.0.4 control panel that came with my computer cannot be updated with the MacTCP 2.0.6 Update installer, an error is reported. I have restored my System Software and the update installer still does not work. What is wrong?

DISCUSSION -----

The MacTCP 2.0.4 control panel that ships with Performa computers cannot be updated using the MacTCP 2.0.6 Update installer. You should use the System 7.5 Update 1.0 which includes MacTCP 2.0.6.

The System 7.5 Update 1.0 will install MacTCP 2.0.6 if it finds an older version in the Control Panels folder. Otherwise, you can use the custom install feature in the System 7.5 Update 1.0 installer by following the steps below:

- 1) Choose Custom Install in the pop-up menu.
- 2) Click the triangle next to Control Panels to expand these options.
- 3) Click the checkbox next to MacTCP to select it.
- 4) Click the Install button.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Macintosh Performa 5xxx/6xxx: Frequently Asked Questions (4/97)

Revised: 4/30/97
Security: Everyone

Macintosh Performa 5xxx/6xxx: Frequently Asked Questions (4/97)

Article Created: 15 November 1995
Article Reviewed/Updated: 30 April 1997

TOPIC -----

This article includes Frequently Asked Questions (FAQ) about the Macintosh Performa 5200 and 6200 series computers.

Questions in this FAQ:
=====

- 1) What are the memory and VRAM expansion capabilities of the Macintosh Performa 5200 and 6200?
- 2) When I put a CD-ROM disc into my CD-ROM drive I get a message stating, "This disk is unreadable by this Macintosh. Do you want to initialize the disk?" What does this message mean?
- 3) My Performa System freezes and I'm wondering if there's something wrong with the machine. How can I check for this?
- 4) I read that there is a flaw in some 603 processors and that there is diagnostic software to check our computers. Where can I find this software?
- 5) Is the GeoPort Telecom Adapter compatible with the Macintosh Performa 5200 and 6200?
- 6) Will the DOS Compatibility Card work in the PDS slot of the Macintosh Performa 5200 and 6200 series computers?
- 7) Why do some benchmark utilities report false information about the Macintosh Performa 5200 and 6200 series computers?
- 8) Is there a Level-2 cache card installed in these computers?
- 9) What kind of hard drive is included? How do I reformat this drive?

10) Can I upgrade my Macintosh Performa 5200 or 6200 computer to a Macintosh Performa 5300 or 6300 computer?

11) Every time I start up my computer I get a message stating that QuickTime installation has failed because QuickTime was already installed. Why does this message appear at startup?

12) When I try to install English Speech Recognition (ESR) on my Macintosh Performa 6200 or 5200 series computer, I get an error message stating that English Speech Recognition requires 16-bit sound input, and that it cannot be used on this Macintosh. What can I do to install this software?

13) I am unable to use any type of external serial device with the modem serial port. Why is this?

14) I get the following message, "Telephone manager 2.0 (or later) is required. Please install this software before launching," when I try to use MegaPhone. What is happening?

15) I cannot hear the dial tone or the other caller when making a call with Megaphone. What should I do?

16) Question: Can I upgrade my Global Village Gold IIv 14.4 Kbps modem to 28.8 Kbps? Does Apple sell a replacement modem?

DISCUSSION -----

1) Question: What are the memory and VRAM expansion capabilities of the Macintosh Performa 5200 and 6200?

Answer: These computers do not have memory soldered on the logic board; all memory is placed in two 72-pin SIMM slots. Memory can be installed in one or both slots using 4, 8, 16 or 32 MB SIMMs. Most configurations shipped with a single 8 MB or 16 MB SIMM in one of the slots. The Power Macintosh 5200 can address up to 64 MB of RAM.

The Performa 5200 and 6200 series, and the Power Macintosh 5200/75 do not use VRAM. These computers store video data in a 1 MB DRAM frame buffer (separate from RAM) and no further video memory expansion is supported.

If you want greater color depth or screen resolution, you can install a third-party video card in the processor-direct slot and attach a second monitor.

2) Question: When I put a CD-ROM disc into my CD-ROM drive I get a message stating, "This disk is unreadable by this Macintosh. Do you want to initialize the disk?" What does this message mean?

Answer: When the CD-ROM drive does not recognize a particular type of CD, this indicates the CD-ROM software is not properly installed or is missing certain files. In some cases, one or several of the CD-ROM "Access" files may be damaged

or a third-party extension or control panel may be conflicting with the CD-ROM software.

See the Tech Info Library article, "CD-ROM: "This disk is unreadable" Message" for the troubleshooting steps you should take to resolve this issue.

3) Question: My Performa System freezes and I'm wondering if there's something wrong with the machine. How can I check for this?

Answer: The 5xxx/6xxx Tester should be used to test for known component issues that may cause system freezing in ALL Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers, including the Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.) The 5xxx/6xxx Tester is available to the following online locations:

- On the Internet at the following sites:
 - Worldwide Web: <http://www.info.apple.com/swupdates>
 - ftp:
ftp://ftp.info.apple.com/Apple.Support.Area/Apple.Software.Updates/US/Macintosh/Utilities/5xxx-6xxx_Tester_1.0.sea.hqx
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

4) Question: I read that there is a flaw in some 603 processors and that there is diagnostic software to check our computers. Where can I find this software online?

Answer: Use the 5xxx/6xxx Tester, mentioned in the answer to question #3 above.

(The following information below is provided for historical purposes:)
Previously, the 52xx/62xx Diagnostic Utility was made available to detect an issue with a small number of PowerPC 603 microprocessors used in ONLY Macintosh Performa 5200, 6200, and Power Macintosh 5200/75 LC computers. Only computers within a specific serial number range were potentially affected by this issue. The Diagnostic Utility was posted on the online services, but it has since been removed with the posting of the 5xxx/6xxx Tester.

5) Question: Is the GeoPort Telecom Adapter compatible with the Macintosh Performa 5200 and 6200?

Answer: The GeoPort Telecom Adapter is not compatible with the Power Macintosh 5200 series. As the Power Macintosh 5200's target audience is the K-12 education channels, support for the GeoPort Telecom Adapter was not part of the requested feature set.

6) Question: Will the DOS Compatibility Card work in the PDS slot of the 5200 series computers?

Answer: No, the DOS Compatibility Card for the Power Macintosh 6100 does not work in Macintosh Performa 5200 and 6200 series computers.

7) Question: Why do some benchmark utilities report false information about the Macintosh Performa 5200 and 6200 series computers?

Answer: Each time Apple Computer releases a new computer, third-party diagnostic utilities which provide benchmark information may not have the data for the new computer. Contact the manufacturer of your diagnostic software for additional information on obtaining an updated version of their software.

8) Question: Is there a Level-2 cache card installed in these computers?

Answer: Yes, a 256k level-2 cache card comes pre-installed on these computers. The level-2 cache card not only functions as a 256k level-2 cache, but contains these computers' ROM set, as well. For this reason, third party level-2 cache cards are not compatible with the Power Macintosh 5200. At this time, Apple does not plan on releasing a larger level-2 cache for the Macintosh Performa 5200 and 6200 series.

9) Question: What kind of hard drive is included in these computers? How do I reformat this drive?

Answer: The Macintosh Performa 5200 and 6200 series computers contain hard drives based on the IDE interface. Apple's implementation of the IDE Interface supports IDE and Enhanced IDE drives. If replacing the internal hard drive with a third-party IDE drive, the replacement IDE drive must support Logical Block Addressing (LBA).

To reformat the IDE drive, you should use the Internal HD Format Utility; if it does not work, use the Drive Setup Utility instead, which is available on the online services. You cannot use Apple HD SC Setup to check the internal IDE hard drive.

10) Question: Can I upgrade my Macintosh Performa 5200 or 6200 computer to a Macintosh Performa 5300 or 6300 computer?

Answer: The 5300/6300 Logic Board Upgrade (M4447LL/A) is available for the Macintosh Performa 5200 and 6200 family of computers.

11) Question: Every time I start up my computer I get a message stating that QuickTime installation has failed because QuickTime was already installed. Why does this message appear at startup?

Answer: This message is caused by having two copies of the QuickTime extension in your System Folder. See the Tech Info Library article, "QuickTime Installation Failed Message at Startup," to resolve this particular issue. The

Apple Tech Info Library is located on the Internet at
<<http://til.info.apple.com/>>

12) Question: When I try to install English Speech Recognition (ESR) on my Macintosh Performa 6200 or 5200 series computer, I get an error message stating that English Speech Recognition requires 16-bit sound input, and that it cannot be used on this Macintosh. What can I do to install this software?

Answer: Using the ESR 1.4.1 installer you can customize the installation and successfully install the PlainTalk software. For detailed instructions, follow the steps given in the Tech Info Library article "Plaintalk 1.4.1: Can't Install Recognition on 8-bit Mac."

13) Question: I am unable to use any type of external serial device with the modem serial port. Why is this?

Answer: The presence of the internal modem disables the modem serial port. See the Tech Info Library article, "Performa: Modem Port Disabled w/Internal Modem Present", for more details.

There are several possible workarounds:

- Consider connecting your serial device to the printer port. If you already have a printer, you might want to investigate a switch box (also referred to as an A/B box) to share the port between the two devices. You would still only be able to use one device at a time, but this would reduce the wear and tear on your connectors by continually reseating the connections.

NOTE: Using a switch box is not tested or supported by Apple. If you choose to use one, contact the switch box manufacturer for compatibility information and technical assistance.

- Instead of using a switch box, you could also use a serial card. Such a card would need to be connected to the processor-direct slot in the computer, and it would provide you with additional serial connections.

- Alternatively, you can remove both the modem card and the plastic cover over the modem port. Instructions for installing a card into the communications slot are included in the Macintosh Performa User's Guide. You can follow these instructions for removing the internal modem. Although such cards are typically user-installable, you may want to contact an Apple-authorized service provider for assistance with this procedure.

NOTE: Any damage caused by the addition or removal of the modem is NOT covered under the warranty.

14) Question: I get the following message, "Telephone manager 2.0 (or later) is required. Please install this software before launching," when I try to use MegaPhone. What is happening?

Answer: MegaPhone installs various invisible resources into the System file. If the System suitcase is damaged or had been replaced these resources are no longer available. See the Tech Info Library article, "MegaPhone for Performa: Telephone Manager Required Message," to resolve this issue.

15) Question: I cannot hear the dial tone or the other caller when making a call with Megaphone. What should I do?

Answer: This can occur if the External CD Sound Extension has been installed or if the Internal Modem Sound extension has been removed or disabled. However, if you have a Macintosh Performa 5300 or 6300 series computer, then you should verify that the Audio Volume extension has not been removed. This extension replaces the Internal Modem Sound extension.

The External CD Sound extension allows you to connect an external CD-ROM player and play audio CD-ROM discs through the internal speaker. The Internal Modem Sound extension needs to be in the Extensions folder for MegaPhone to work properly. See the Tech Info Library article, "Megaphone: Caller Hears Me, I Can't Hear Them ," to resolve this issue.

16) Question: Can I upgrade my Global Village Gold IIv 14.4 Kbps modem to 28.8 Kbps? Does Apple sell a replacement modem?

Answer: Apple does not offer an upgrade for your modem. However, Global Village has recently released an upgrade path for your modem. This upgraded internal modem would replace the modem already installed in your computer.

Contact Global Village Communications directly (800-469-3764) to order this modem or to obtain additional information, including compatibility with specific computer systems and pricing.

Note that support for this modem, once installed on a Performa computer, will be provided by Global Village directly. Apple only supports Global Village modems which are bundled with specific systems.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Power Macintosh 5200: Video Playback Issue with MPEG (11/95)

Revised: 11/15/95
Security: Everyone

Power Macintosh 5200: Video Playback Issue with MPEG (11/95)

=====

Article Created: 15 November 1995

TOPIC -----

I have a Power Macintosh 5200 series computer with an MPEG card. However, when I try to use the MPEG card to play video, I either don't see any video at all or the computer locks up. What could be causing this?

DISCUSSION -----

Some of the Power Macintosh 5200 series computers with 8-bit sound have an issue with the Apple MPEG Card. The solution is to replace the MPEG card.

If you are experiencing difficulty using the MPEG card to play video, contact an Apple-authorized service provider or the Apple Assistance Center (800-SOS-APPL) for additional assistance or service.

AppleVision 1710AV Display: Energy Saver Issue (11/95)

Revised: 2/12/96
Security: Everyone

AppleVision 1710AV Display: Energy Saver Issue (11/95)

=====

Article Created: 16 November 1995

TOPIC -----

This article discusses an issue with the AppleVision 1710AV display and the Energy Saver mode.

DISCUSSION -----

Apple has recently discovered an issue related to Energy Saver mode when used with a limited number of early shipping AppleVision 1710AV Displays.

AppleVision 1710AV Displays with serial numbers between SG522xxxxxx and SG536xxxxxx inclusive should have Energy Saver mode temporarily disabled using the Energy Saver control panel until the display can be serviced. Displays within this serial number range may not operate as originally intended while in Energy Saver mode when connected to a Power Macintosh 7200, 7500, 8500, or 9500 computer, or some third-party video cards. Monitors with serial numbers greater than SG537xxxxxx are not affected and will function normally with Energy Saver.

Symptoms

=====

- Under normal operation, when the display goes into Energy Saver mode, there is no visible raster and the power LED is not illuminated.
- In affected displays, there is still no video but the power LED begins to randomly flash, and you may hear a popping or clicking sound from the display enclosure or speakers. In some displays, this repeated cycling can cause loss of video.

Workaround

=====

The workaround prior to service of the display is to disable System Sleep in the Energy Saver control panel.

With System Sleep temporarily disabled, if you wish to put your computer and display to sleep, manually select Sleep from the Special menu, or shut down your computer completely.

If you experience this issue, or your monitor falls within the stated serial number range, contact your local service provider or 1-800-SOS-APPL. International customers should contact your local service provider.

Dual-Channel Asynchronous SCSI Interface: An Overview (2/97)

Revised: 2/24/97
Security: Everyone

Dual-Channel Asynchronous SCSI Interface: An Overview (2/97)

=====

Article Created: 27 November 1995
Article Reviewed/Updated: 24 February 1997

TOPIC -----

This article provides a general overview of the dual-channel asynchronous SCSI interface included in some Macintosh computers.

For specific information about the implementation of dual-channel SCSI or Fast-SCSI in different Macintosh computers, see these related Tech Info articles:

"Power Mac 7500,7600,8500,9500 Series: SCSI-2 Compliance"
"Power Macintosh: SCSI Termination Explained"
"Macintosh: Compatibility with SCSI-2 Devices"
"SCSI Manager 4.3: Compatibility and Features"
"Technical Specifications" for each Macintosh computer.

DISCUSSION -----

Computers with dual-channel asynchronous SCSI have a single SCSI controller responsible for the entire I/O subsystem. This primary I/O controller chip manages SCSI communications through dual SCSI controllers: a controller for the internal SCSI bus and a second controller chip for an external SCSI connection and an additional internal connection. This second SCSI controller also manages Ethernet and serialcommunications. In the Power Macintosh 7300, 7500, 7600, 8500, 8600, 9500, and 9600 computers, the internal SCSI bus controller provides Fast SCSI communications up to 10 MB per second.

Because there are actually two separate SCSI buses, both are capable of handling seven devices. So, theoretically, you could have 13 devices attached to the computer. (Note that the theoretical limit is not 14 because the computer will always be one of the devices). However, space limitations prohibit the connection of that many separate devices.

With only one internal connector, the internal SCSI bus will be particularly

limited by the amount of available space inside the computer. For the other SCSI bus, you also are limited by space for internal devices, but the external devices are only limited by SCSI ID numbers.

Different computer models may have distinct standard configurations of the SCSI buses. For example, on the Power Macintosh 9500 series, the internal CD-ROM drive and the internal hard drive are both attached to the Fast (internal) SCSI bus, but on the Power Macintosh 8100 series, only the internal hard drive is attached to the internal SCSI bus; the CD-ROM drive is on the other SCSI bus.

System 7.5 Only and ARA: Extensions and Control Panels (11/95)

Revised: 11/16/95
Security: Everyone

System 7.5 Only and ARA: Extensions and Control Panels (11/95)

=====

Article Created: 16 November 1995

TOPIC -----

I want to verify that Apple Remote Access (ARA) is not conflicting with another extension. Beside choosing System 7.5 Only, in the Sets pop-up menu of the Extensions Manager control panel, what other extensions do I need to enable?

DISCUSSION -----

In the Apple Menu folder: Remote Access Disconnect
In the Control Panels folder: Remote Access Setup
In the Extensions folder: Remote Access Aliases and Remote Only

Enabling System 7.5 only and ARA extensions and control panels may not find the conflicts or system corruption you are investigating, because ARA loads resources in the System file also. A clean system software installation may be required if issues persist, even with only these extension loaded.

System 7.5.2 Printing Fix 1.1: Read Me File (11/95)

Revised: 11/16/95
Security: Everyone

System 7.5.2 Printing Fix 1.1: Read Me File (11/95)

=====

Article Created: 16 November 1995

TOPIC -----

This article contains the ReadMe file included with the System 7.5.2 Printing Fix version 1.1 which is part of the System 7.5.2 Printing Update 1.1 posted online.

DISCUSSION -----

Macintosh System 7.5.2 Printing Fix Read Me

What is the Macintosh System 7.5.2 Printing Fix (Version 1.1)?

This system extension fixes printing problems that may occur on Power Macintosh 7200, 7500, 8500, and 9500 computers using System 7.5.2. Without this fix, your computer may freeze if you attempt to print on a network printer, and it may be necessary to restart your computer.

To install this extension follow these steps:

Step 1

Locate the System Folder on the computer's hard disk. Don't open the System Folder.

Step 2

Drag the file named "7.5.2 Printing Fix" to the System folder.

Step 3

A message appears asking if you want the 7.5.2 Printing Fix to be put into the Extensions Folder. Click OK. If a message appears stating that the 7.5.2 Printing Fix already exists and asks you if you would like to replace it, click

OK.

Step 4

Open the Special menu and choose Restart.

What is new with version 1.1 of this extension?

Version 1.0.2 of the 7.5.2 Printing Fix corrected a problem printing to a network printer when the printer was already busy. Version 1.1 also corrects a similar problem when printing to a network printer using LocalTalk.

System 7.5.2 Printing Update 1.1: Read Me File (1/97)

Revised: 2/14/97
Security: Everyone

System 7.5.2 Printing Update 1.1: Read Me File (1/97)

Article Created: 16 November 1995
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article contains the ReadMe file from the System 7.5.2 Printing Update 1.1.

DISCUSSION -----

Macintosh System 7.5.2 Printing Update Read Me

(Important Note: This printing update was incorporated into System 7.5 Update 2.0, released in March 1996, as well as successive System Software releases, including System 7.5.3, System 7.5.3 Revision 2 and System Update 7.5.5, as well as later releases.

What are the Macintosh System 7.5.2 Printing Updates?

These software updates fix printing problems that may occur on Power Macintosh 7200, 7500, 8500, and 9500 computers using System 7.5.2. Without these fixes, your computer may freeze or never complete printing, and it may be necessary to restart your computer or cancel the printing job.

This bundle contains several folders. Each folder contains an update, and a Read Me file that explains how to install the update and what problems are fixed. To avoid printing problems, install each of these updates.

Contents

SerialDMA folder

Use this update to fix problems while printing on serial printers and to improve overall performance of the serial port.

7.5.2 Printing fix folder

Use this update to fix problems while printing on network printers.

LaserWriter 8.3.2 folder

Use this update to fix problems while printing on network printers. All versions of the LaserWriter driver prior to LaserWriter 8.3.2 contain problems preventing PCI-based computers from printing on a busy printer and printing large documents. All System 7.5.2 users should install the LaserWriter 8.3.2 driver included in this folder.

Open Transport information

For the 7.5.2 Printing fix and LaserWriter 8.3.2 to work properly, you must have Open Transport 1.0.7 or later installed on your system.

Open Transport software is available on the following online locations:

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Troubleshooting known System 7.5.2 printing problems
=====

A postscript error appears when you attempt to print.

Sometimes attempting to print large files on older LaserWriter printers (including the LaserWriter IINT, IINTX, and other Postscript level 1 printers) results in a postscript error.

Workaround: Before you print, convert the files to gray scale 300 DPI images.

A message appears stating that there's a "-49" error.

This problem can occur when you use the Print command from the File menu on the desktop. The error occurs if you try to print multiple documents from more than one application program at the same time.

Workaround: Print documents from one application at a time when printing from the desktop.

A message appears stating that there's a "Type 10" error when you print Adobe Photoshop documents from the desktop.

This error occurs when you print an Adobe Photoshop file from the desktop using

the Print command.

Workaround: Print Adobe Photoshop documents from within Photoshop (make sure Photoshop is active, then use Photoshop's File menu to print).

Postscript errors occur or documents never print when printing QuarkXPress documents.

Postscript errors may occur while printing QuarkXPress documents if the printer type is not set correctly in the QuarkXPress Page Setup dialog box.

Workaround:

- Make sure the correct printer type is selected in the QuarkXPress Page Setup dialog box.
- If the printer type is correct in the Page Setup dialog box and you are using a LaserWriter 16/600 printer and QuarkXPress 3.3, a later version of QuarkXPress may help. Contact Quark for assistance.

Article Change History:

14 Feb 1997 - Reformatted.

Apple Video Player 1.3.2: Where is Tint Control? (11/95)

Revised: 11/17/95
Security: Everyone

Apple Video Player 1.3.2: Where is Tint Control? (11/95)

=====

Article Created: 17 November 1995

TOPIC -----

I upgraded from Apple Video Player version 1.0.3 to version 1.3.2, and I noticed that the Tint control is now missing from the Controls window. The Contrast option has taken its place. Why?

DISCUSSION -----

The reason for switching the control from Tint to Contrast is Tint had no effect on non-NTSC video systems, such as PAL and SECAM. Changing the Tint setting to Contrast offers European customers the same adjustment flexibility as US customers using Apple Video Player.

LaserWriter 8.3.2: Read Me file(7/96)

Article Created: 17 November 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This article contains the Readme file for the LaserWriter 8.3.2 software.

DISCUSSION -----

What is the Macintosh System LaserWriter 8.3.2 Extension?

This system extension fixes two printing problems that may occur on Power Macintosh 7200, 7500, 8500, and 9500 computers using System 7.5.2. Without these fixes, your computer may freeze if you attempt to print large documents on a network printer, or if you try to print any document on a network printer when the printer is already busy.

To install this extension follow these steps:

1. Locate the System Folder on the computer's hard disk. Don't open the System Folder.
2. Drag the file named "LaserWriter 8" to the System Folder.
3. A message appears asking if you want the LaserWriter 8 extension to be put into the Extensions Folder. Click OK. If a second message appears stating that LaserWriter 8 already exists and asks you if you would like to replace it, click OK.
4. Open the Special menu and choose Restart.

IMPORTANT

If a second message does not appear, then your System Folder is missing some files needed to use LaserWriter 8. Do the following:

1. Refer to the printed manual that came with your computer, and follow the instructions for doing a custom installation.
2. In the Custom Install dialog box you'll see a list of items that can be installed. Click the arrow to the left of the "Printing" check box to reveal the list of printers.
3. Click to put an X in the "LaserWriter 8" checkbox.
4. Click Install. If a message appears stating that you have a newer version already installed, click Newer.
5. Quit the Installer. Open the Special menu and choose Restart.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

SerialDMA 2.0.2 Read Me (11/95)

Revised: 11/17/95
Security: Everyone

SerialDMA 2.0.2 Read Me (11/95)

=====

Article Created: 17 November 1995

TOPIC -----

This article contains the Readme file for the SerialDMA 2.0.2 software.

DISCUSSION -----

What is the SerialDMA 2.0.2 extension?

Version 2.0.2 of this extension is simply version 2.0 of this extension plus a couple of additional fixes and support for the new PCI Power Macintosh computers (7200, 7500, 8500, and 9500). Version 2.0 of this extension was a complete rewrite of the DMA serial driver which originally accompanied the Centris 660AV, Quadra 660AV, Quadra 840AV, Power Macintosh 6100/60, Power Macintosh 6100/66, Power Macintosh 7100/66, Power Macintosh 7100/80, Power Macintosh 8100/80, Power Macintosh 8100/100, and Power Macintosh 8100/110. It also supports the various Performa and Apple Workgroup Server products derived from the models listed. The SerialDMA driver is a replacement for the standard set of Macintosh serial device drivers referred to by their driver names: ".AIn," ".AOut," ".BIn," and ".BOut." SerialDMA is applicable only to the set of Macintosh models which incorporate DMA channels servicing the standard Z8530 Serial Communications Controller.

The original serial driver for these products suffered from occasional system hangs, communications timeouts, poor communications performance, and various other glitches. The new SerialDMA 2.0.2 driver corrects these problems and provides the targeted products with a serial driver that should exceed the performance and reliability standards for serial communications on the Macintosh platform.

Installing SerialDMA 2.0.2 extension

The SerialDMA extension requires System 7.5 or later. To install this extension, drag it onto the System folder of your boot drive (the Finder will

remind you that extensions need to be placed in the Extensions folder; click OK and the SerialDMA extension will be copied). After the SerialDMA extension is in your System folder, you need to restart your Macintosh.

What the SerialDMA 2.0.2 extension provides

The following problems have been eliminated to improve functionality and compatibility:

- The SerialDMA driver will no longer mysteriously "lock up" and cease processing new input requests as a result of interrupt synchronization problems during chained reads.
- The SerialDMA driver will no longer fail to complete a transmission correctly on a Power Macintosh. This fixes a longstanding driver bug referenced in the GlobalFAX software release notes, since it had a highly detrimental effect on that FAX software. This problem could have affected any sort of file transfer using hardware or XOn/XOff handshaking.
- Handshaking now works reliably, especially XOn/XOff handshaking. This will eliminate numerous scenarios where customers were seeing gratuitous overrun errors.
- Driver performance and responsiveness is now more than acceptable for small input requests. The original driver highly favored large transfer performance over small transfer performance, resulting in unacceptable performance degradation for a large number of customers.
- It is now possible once again to make a synchronous I/O request of the SerialDMA driver from a VBL, Time Manager task, or other interrupt task. This improves compatibility with some products, but should not be considered an endorsement of this unsupported technique.
- Break conditions are now handled correctly, producing results consistent with what would be seen in a non-DMA serial driver.
- A bug was fixed allowing DTR to remain negated when the driver is closed. Formerly it was possible for DTR to become asserted when closing the driver, even when the client software requested otherwise.
- A bug in the algorithm used by older versions of SerialDMA for setting some baud rates could give improper results. This has been fixed in SerialDMA 2.0.2. This bug affected Quadra 840AV and 660AV CPUs only.
- A bug in older versions of SerialDMA that caused problems printing to StyleWriters has been fixed in SerialDMA 2.0.2. This bug affected Power Macintosh 7200/7500/8500/9500 CPUs only.

The following enhancements improve performance and reliability:

- The SerialDMA driver is now native for Power Macintosh. This driver grew in size very little as a result of RISC code expansion. On 68040 models, SerialDMA is now compiled with a much better optimizing compiler resulting in

significantly smaller and faster code. Simplifications in the basic driver design also reduce code size while improving reliability.

- SerialDMA 2.0.2 takes fuller advantage of the power of DMA to offer 115,200 and 230,400 baud serial data streams. (Driver clients should operate within certain efficiency guidelines to ensure that they do not become bottlenecks at these high data rates.)
- SerialDMA 2.0.2 uses a more efficient hardware abstraction interface to support different Macintosh models with a minimum of administrative overhead. This also improves driver reliability.
- DMA receive channel management has been significantly improved, resulting in almost no possibility of hardware overrun errors and allowing higher data rates with higher reliability. Error reporting is more robust.
- DMA transmit channel management has been improved for some DMA architectures, reducing overhead by use of a dump-and-run DMA strategy.
- The mechanism for implementing XOn/XOff handshaking is more sophisticated, and results in better performance with less system overhead.

Note:

There is a known problem on Power Macintosh 7200, 7500, 8500, and 9500 with the Serial Port Arbitrator that ships as part of AppleTalk Remote Access. The problem can cause a crash at boot time if both SerialDMA and Serial Port Arbitrator are present. Serial Port Arbitrator should be removed from your System folder to avoid this conflict.

Security: Everyone

Power Macintosh 7200/90: Ethernet Issue (11/96)

Article Created: 17 November 1995
Article Reviewed/Updated: 4 November 1996

TOPIC -----

This article describes the Power Macintosh 7200 Ethernet Jitter Service Notice - December 1995.

DISCUSSION -----

Overview

Under certain network conditions, independent of the protocol being used, the Power Macintosh 7200/90 computer's built-in Ethernet port may fail to successfully send large packets over Ethernet.

Depending on the application or operation being performed, a user might experience one of the symptoms summarized below:

- 1) When using TCP as the transport protocol, the Power Macintosh 7200/90 may lock-up or timeout under certain conditions (for example, transferring a file to a UNIX host, or sending or composing messages from a Notes client to a Lotus Notes server).
- 2) Transferring or printing large files across certain repeaters may appear to cause the Power Macintosh 7200/90 to hang or may exhibit poor performance.

IMPORTANT: Not all Power Macintosh 7200/90 customers will experience this problem nor are other Power Macintosh models affected.

As of November 1995, Apple inventory of both service parts and newly manufactured computers are not affected by this issue.

Identification

If the Power Macintosh 7200/90 unit has a serial number of xx545xxxxxx or higher, then the computer should have the revised logic board installed.

If the Power Macintosh 7200/90 has a serial number of xx544xxxxxx then the computer MOST LIKELY has the revised logic board, but you should perform a visual inspection of the logic board using the Logic Board Identification instructions below.

If the Power Macintosh 7200/90 has a serial number of xx543xxxxxx or below then you will need to do a visual inspection of the logic board using the Logic Board Identification instructions below.

Troubleshooting

If you believe that you are experiencing difficulties related to this Ethernet jitter issue, we recommend that you try the following troubleshooting steps:

STEP ONE: VERIFICATION

- Verify that you are using a Power Macintosh 7200/90.
- Verify that the unit is attached to an Ethernet network.

STEP TWO: ISOLATE USING A NON-POWER MACINTOSH 7200/90 COMPUTER

Does the problem occur on systems other than the Power Macintosh 7200/90 (preferably Power Macintosh 7200/75 to 9500 computers that use Apple's new Open Transport networking protocol)?

- If YES, then the problem may be related to the software or network that the unit is attached to. Perform basic software and network troubleshooting to narrow down the problem.
- If NO, then the problem may be related to Ethernet clock jitter. Refer to Logic Board Identification below to determine whether or not the logic board has been reworked. If the logic board has already been reworked then you may have a network problem. If the board has not been reworked then replace the main logic board in at least one of the systems to verify whether a reworked board resolves the problem.

Logic Board Identification

To identify whether a Power Macintosh 7200/90 logic board has been reworked is to look at location G1 on the main logic board. G1 is located next to the internal 50-pin SCSI connector and the CURIO ASIC.

- If there is a 20MHz oscillator present at location G1 on the main logic board then the logic board has been reworked.
- If no 20MHz oscillator is present (four blank solder pads) then the board has not been reworked.

IMPORTANT:

If you contact (800) SOS-APPL for assistance with this issue, inform the engineer to reference Tech Info Library article, 0018825.

QuickDraw 3D Glossary of Terms - A to F (1/96)

=====

Article Created: 17 November 1995
Article Reviewed/Updated: 25 January 1996

TOPIC -----

This article is a glossary of terms for QuickDraw 3D.

DISCUSSION -----

2D: Two-dimensional. See also planar.

3D: Three-dimensional. See also spatial.

3DMF: See QuickDraw 3D Object Metafile.

3D pointing device: Any physical device capable of controlling movements or specifying positions in three-dimensional space.

3D Viewer: A shared library that you can use to display 3D objects and other data in a window and to allow users limited interaction with those objects. See also viewer object.

accelerator: See graphics accelerator.

adjoint: The transpose of a matrix in which each element has been replaced by its cofactor.

adjoint matrix: See adjoint.

affine matrix: A matrix that specifies an affine transform.

affine transform: Any arbitrary concatenation of scale, translate, and rotate transforms. An affine transform preserves parallel lines in the objects transformed.

aliasing: The jagged edges (or staircasing) that result from drawing an image on

a raster device such as a computer screen. Compare antialiasing.alpha channel A color component in some color spaces whose value represents the opacity of the color defined in the other components. Compare ARGB color structure.

ambient coefficient: A measure of an object's level of reflection of ambient light.

ambient light: An amount of light of a specific color that is added to the illumination of all surfaces in a model.

ambient reflection coefficient: See ambient coefficient.

antialiasing: The smoothing of jagged edges on a displayed shape by modifying the transparencies of individual pixels along the shape's edge. Compare aliasing.

API: See application programming interface.

application coordinate system: See world coordinate system.

application space: See world coordinate system.

application programming interface (API): The total set of constants, data structures, routines, and other programming elements that allow developers to use some part of the system software.

area: A rectangular section of a plane. Defined by the TQ3Area data type.

ARGB color space: A color space whose components measure the intensity of red, green, and blue, together with the opacity (or alpha component) of the color thus defined.

ARGB color structure: A data structure that contains information about a color and its opacity. Defined by the TQ3ColorARGB data type.

artifact: Any oddity or unwanted feature of a rendered image. Compare aliasing.

aspect ratio: The ratio of the width of an image or other rectangular area to its height.

aspect ratio camera: A type of perspective camera defined in terms of a viewing angle and a horizontal-to-vertical aspect ratio.

aspect ratio camera data structure: A data structure that contains basic information about an aspect ratio camera. Defined by the TQ3ViewAngleAspectCameraData data type.

attenuation: The loss of light intensity over distance.

attribute: See attribute object.

attribute metahandler: A metahandler that defines methods for handling custom attribute data.

attribute object: A type of QuickDraw 3D object that determines some of the characteristics of a model, such as the color of objects or parts of objects in the model, the transparency of objects, and so forth. An attribute is of type TQ3Element. See also ambient coefficient, diffuse color, highlight state, normal vector, shading parameterization, specular color, specular reflection exponent, standard surface parameterization, surface shader, surface tangent, transparency color.

attribute set: A collection of zero or more different attribute types and their associated data.

axis: See coordinate axis.

back clipping plane: See yon plane.

backface culling: Ignoring backfacing polygons during rendering. Backface culling can reduce the amount of time required to render a model. Compare hidden surface removal.

backfacing polygon: Any polygon in a surface whose surface normal points away from a view's camera.

backfacing style: A type of QuickDraw 3D object that determines whether or not a renderer draws shapes that face away from a scene's camera.

badge: A visual element in a frame of a 3D model displayed by the 3D Viewer that distinguishes the frame from a static image.

base class: See parent class.

big-endian: Data formatting in which each field is addressed by referring to its most significant byte. See also little-endian.

binary file: A file object whose data is a stream of raw binary data, the type of which is indicated by object type codes. Compare text file.

bitmap: A two-dimensional array of values, each of which represents the state of one pixel. Defined by the TQ3Bitmap data type. See also pixmap, storage pixmap.

bounding box: A rectangular box, aligned with the coordinate axes, that completely encloses an object. Defined by the TQ3BoundingBox data type.

bounding loop: A section of code in which all bounding box or sphere calculation takes place. A bounding loop begins with a call to the Q3View_StartBoundingBox (or Q3View_StartBoundingSphere) routine and should end when a call to Q3View_EndBoundingBox (or Q3View_EndBoundingSphere) returns some value other than kQ3ViewStatusRetraverse. A bounding loop is a type of submitting loop. See also picking loop, rendering loop, writing loop.

bounding sphere: A sphere that completely encloses an object. Defined by the TQ3BoundingSphere data type.

bounding volume: A bounding box or a bounding sphere.

bounds: See bounding volume.

box: A three-dimensional object defined by an origin (that is, a corner of the box) and three vectors that define the edges of the box meeting in that corner. Defined by the TQ3BoxData data type.

B-spline curve: A curve that passes smoothly through a series of control points.

B-spline polynomial: A parametric equation that defines a B-spline curve.

B-spline surface: A surface that passes smoothly through a series of control points.

camera: See camera object. camera angle button A button in the controller strip of a viewer object that, when held down, causes a pop-up menu to appear listing the available cameras. Compare distance button, move button, rotate button, zoom button.

camera coordinate system: The coordinate system defined by a view's camera. Also called the view coordinate system. Compare local coordinate system, window coordinate system, world coordinate system.

camera data structure: A data structure that contains basic information about a camera. Defined by the TQ3CameraData data type.

camera location: The position, in the world coordinate system, of a camera. Also called the eye point. Compare camera placement structure.

camera object: A type of QuickDraw 3D object that you can use to define a point of view, a range of visible objects, and a method of projection for generating a two-dimensional image of those objects from a three-dimensional model. A camera object is an instance of the TQ3CameraObject

class: See also aspect ratio camera, orthographic camera, view plane camera.

camera placement: The location, orientation, and direction of a camera. See also camera placement structure.

camera placement structure: A data structure that contains information about the placement (that is, the location, orientation, and direction) of a camera. Defined by the TQ3CameraPlacement data type.

camera range: The spatial extent that lies between the hither and yon planes of a camera. See also camera range structure.

camera range structure: A data structure that contains information about the hither and yon clipping planes for a camera. Defined by the TQ3CameraRange data type.

camera space: See camera coordinate system.

camera vector: See viewing direction.

camera view port: The rectangular portion of a view plane that is to be mapped onto the area specified by the current draw context.

camera view port structure: A data structure that contains information about the view port of a camera. Defined by the TQ3CameraViewPort data type.

cap: A plane figure having the shape of an oval that closes the base of a cone or one end of a cylinder.

Cartesian coordinate system: A system of assigning planar positions to objects in terms of their distances from two mutually perpendicular lines (the x and y coordinate axes), or of assigning spatial positions to objects in terms of their distances from three mutually perpendicular lines (the x, y, and z coordinate axes). Compare polar coordinate system, spherical coordinate system.

center of projection: The point at which the projectors in a perspective projection intersect.

child class: A class that is immediately below some other class (the parent class) in the QuickDraw 3D class hierarchy. For example, the light class is a child class of the shape class. A child class inherits all of the methods of its parent. Also called a subclass.

clamp: For a shader effect, to replicate the boundaries of the effect across the portion of the mapped area that lies outside the valid range 0.0 to 1.0. Compare wrap.

class: See QuickDraw 3D class.

class type: See object type.

clipping plane: Either of the two planes that limit the part of a model that is rendered. See also hither plane, yon plane.

closed: Not open. Compare open.

color space: A specification of a particular method for representing colors. Compare RGB color space.

complement: The set of points that lie outside a given solid object. The complement of the object A is represented by the function \bar{A} . Compare intersection, union.

component: See mesh component.

concave polygon: A polygon with at least one interior angle greater than 180°. Compare convex polygon.

conic: See conic section.

conic section: Any two-dimensional curve that is formed by the intersection of a plane with a right circular cone. The most common conic sections are ellipses, circles, parabolas, and hyperbolas. Compare nonuniform rational B-spline (NURB).

connected: Said of a pair of mesh vertices if an unbroken path of edges exists linking one vertex to the other. Compare mesh component.

constant shading: A method of shading surfaces in which the incident light color and intensity are calculated for a single point on a polygon and then applied to the entire polygon. Compare Gouraud shading, Phong shading.

constant subdivision: A method of subdividing smooth curves and surfaces. In this method, the renderer subdivides a curve into some given number of polyline segments and a surface into a certain-sized mesh of polygons. Compare screen-space subdivision, world-space subdivision.

constructive solid geometry (CSG): A way of modeling solid objects constructed from the union, intersection, or difference of other solid objects.

container face: The face in a mesh that contains a particular contour.

contour: A list of vertices. In a mesh, a contour specifies a hole in a face. Compare container face.

controller: See controller object.

controller channel: Any piece of information sent from an application to an input device. Compare controller value.

controller data structure: A data structure that contains information about a controller. Defined by the TQ3ControllerData data type. controller object A QuickDraw 3D object that represents a 3D pointing device. A controller object is an instance of the TQ3ControllerObject class. See also tracker object.

controller state: See controller state object.

controller state object: A QuickDraw 3D object that represents the current channels and other settings of a controller. A controller state object is an instance of the TQ3ControllerStateObject class.

controller strip: A rectangular area at the bottom of a viewer object that contains one or more controls (usually buttons). Compare camera angle button, distance button, move button, rotate button, zoom button.

controller value: Any piece of information sent from an input device to an application. Compare controller channel.

control point: A geometric point used to control the curvature of a curve or surface. Compare knot.

convex polygon: A polygon whose interior angles are all less than or equal to 180°. Compare concave polygon.

coordinate axis: A line in a plane or in space that helps to define the position of geometric objects. See also x axis, y axis, z axis.

coordinates: (1) See coordinate system. (2) See tracker coordinates.

coordinate space: See coordinate system.

coordinate system: Any system of assigning planar or spatial positions to objects. Compare Cartesian coordinate system, polar coordinate system, spherical coordinate system.

corner: See mesh corner.

cross product: The vector that is perpendicular to two given vectors and whose magnitude is the product of the magnitudes of those two vectors multiplied by the sine of the angle between them. The cross product of the vectors u and v is denoted $u \times v$. Compare dot product.

CSG: See constructive solid geometry.

CSG equation: A value that encodes which CSG operations are to be performed on a model's CSG objects.

CSG object ID: A number, attached to an object as an attribute, that identifies an object for CSG operations.

C standard I/O library: See standard I/O library.

C string object: A QuickDraw 3D object that contains a standard C string (that is, an array of characters terminated by the null character).

culling: See backface culling.

custom: Supplied by your application, not by QuickDraw 3D.

custom surface parameterization: A parameterization of a surface supplied by your application. Compare natural surface parameterization, standard surface parameterization.
database file A metafile in which all shared objects contained in the file are listed in the file's table of contents. See also normal file, stream file.

database mode: The mode in which a database file is opened. See also normal mode, stream mode.

default surface parameterization: See standard surface parameterization.

degrees of freedom (DOF): The number of dimensions that are independently specifiable by a particular input device. For example, a slider or a dial has one degree of freedom; a mouse typically has two degrees of freedom.

device coordinate system: See window coordinate system.

device space: See window coordinate system.

differential scaling: A scale transform in which the scaling values $d x$, $d y$, and $d z$ are not all identical. Compare uniform scaling.

diffuse coefficient: A measure of an object's level of diffuse reflection.

diffuse color: The color of the light of a diffuse reflection.

diffuse reflection: The type of reflection that is characteristic of light reflected from a dull, nonshiny surface. Also called Lambertian reflection. Compare specular reflection.

diffuse reflection coefficient: See diffuse coefficient.

directional light: A light source that emits parallel rays of light in a specific direction.

directional light data structure: A data structure that contains information about a directional light. Defined by the `TQ3DirectionalLightData` data type.

dirty state: A Boolean value that indicates whether an unknown object is preserved in its original state (`kQ3False`) or should be updated when written back to the file object from which it was originally read (`kQ3True`).

display group: A type of group that contains drawable objects. See also ordered display group, proxy display group.

distance button: A button in the controller strip of a viewer object that, when clicked, puts the cursor into trucking mode. Subsequent dragging up or down in the picture area causes the object to move farther away or closer. Compare camera angle button, move button, rotate button, zoom button.

DOF: See degrees of freedom.

dot product: The floating-point number obtained by multiplying corresponding scalar components of two vectors and then adding together all those products. The dot product of the vectors u and v is denoted $u \cdot v$. Compare cross product.

drawable flag: A group state flag that determines whether a group is to be drawn when it is passed to a view for rendering or picking. Compare inline flag, picking flag.

draw context: See draw context object.

draw context coordinate system: See window coordinate system.
draw context data structure A data structure that contains basic information about a draw context. Defined by the `TQ3DrawContextData` data type.

draw context object: A QuickDraw 3D object that maintains information specific to a particular window system or drawing destination. A draw context object is an instance of the `TQ3DrawContextObject` class. See also Macintosh draw context, pixmap draw context.

draw context space: See window coordinate system.

drawing destination: The window or other output destination for a rendered model.

edge: A straight line that connects two vertices. See also mesh edge.

edge tolerance: A measure of how close a point must be to a line for a hit to occur. Compare vertex tolerance.

element: See element object.

element object: Any QuickDraw 3D object that can be part of a set. An element object is an instance of the TQ3ElementObject class.

elevation projection: A type of orthographic projection in which the view plane is perpendicular to one of the principal axes of the object being projected. See also front elevation projection, side elevation projection, top elevation projection. Compare isometric projection.

error: A nonrecoverable condition that causes the currently executing QuickDraw 3D routine to fail. See also fatal error, notice, warning.

Error Manager: The part of QuickDraw 3D that you can use to handle any errors or other exceptional conditions that occur during the execution of QuickDraw 3D routines.

even-odd rule: A method of determining which planar areas defined by an arbitrary list of vertices are inside a polygon. To determine whether a particular bounded region is inside or outside a polygon, shoot a ray from any point in that region in any direction that does not intersect any vertex. If the ray cuts an odd number of edges, that region is inside the polygon; if the ray cuts an even number of edges, that region is outside the polygon.

eye point: See camera location.

face: A closed figure that forms part of the surface of an object. Usually faces are planar, but mesh faces do not need to be planar. See also mesh face.

face attribute: An attribute that defines a characteristic of a polygonal object.

face index: In a mesh, a unique integer (between 0 the total number of faces in the mesh minus 1) associated with a face. Compare vertex index.

facet: See face.

faceted shading: See constant shading.fall-off value A measure of the attenuation of a spot light's intensity from the edge of the hot angle to the edge of the outer angle. See also hot angle, outer angle.

far plane: See yon plane.

fatal error: An error whose effects persist even after the call that caused it has ended.

field of view: The horizontal or vertical angular expanse visible through a camera. See also aspect ratio camera.

file: See file object.

file idle method: A callback routine that is called during lengthy file operations. Compare view idle method.

file mode: A set of flags that determine which operations can be performed on a piece of storage.

file mode flag: A value used to construct a file mode.

file object: A type of QuickDraw 3D object that you can use to access disk- or memory-based data stored in a container. A file object is an instance of the TQ3FileObject class. See also storage object.

file status value: A value returned by the Q3File_EndWrite function that indicates whether QuickDraw 3D has finished writing the model to a file object.

fill style: A type of QuickDraw 3D object that determines whether an object is drawn as a solid filled object or is decomposed into its components (namely, into a set of edges or points).

flat shading: See constant shading.

frame: See viewer pane.

front clipping plane: See hither plane.

front elevation projection: A type of elevation projection in which the view plane is parallel to the front of the object being projected.

frustum: A solid figure created by cutting a cone or pyramid with two parallel planes. Compare view frustum.

frustum coordinate system: See camera coordinate system.

frustum space: See camera coordinate system.

frustum-to-window transform: A transform that defines the relationship between a frustum coordinate system and a window coordinate system. Compare local-to-world transform, world-to-frustum transform.

QuickDraw 3D Glossary of Terms - G to O (1/96)

=====

Article Created: 17 November 1995
Article Reviewed/Updated: 25 January 1996

TOPIC -----

This article is a glossary of terms for QuickDraw 3D.

DISCUSSION -----

general polygon: A closed plane figure defined by one or more lists of vertices (that is, defined by one or more contours). Defined by the TQ3GeneralPolygonData data type. See also simple polygon.

generic renderer: A renderer that you can use solely to collect state information. The generic renderer does not draw any image.

geometric object: A type of QuickDraw 3D object that describes a particular kind of drawable shape, such as a triangle or a box. A geometric object is an instance of the TQ3GeometryObject class. See also box, general polygon, line, marker, mesh, NURB curve, NURB patch, point, polygon, triangle, trigrid.geometric primitive Any of the basic geometric objects defined by QuickDraw 3D.

geometry: See geometric object.

geometry attribute: An attribute that defines a characteristic of a nonpolygonal geometric object.

global coordinate system: See world coordinate system.

global space: See world coordinate system.

Gouraud shading: A method of shading surfaces in which the incident light color and intensity are calculated for each vertex of a polygon and then interpolated linearly across the entire polygon. Compare constant shading, Phong shading.

graphics accelerator: Any hardware device used by QuickDraw 3D to accelerate rendering.

group: See group object.

group object: A type of QuickDraw 3D object that you can use to collect objects together into hierarchical models. A group object is an instance of the TQ3GroupObject class.

group position: A pointer to a data structure maintained internally by QuickDraw 3D that indicates the position of a group element in the group.

group state flag: A value that indicates the state of some characteristic of a group.

group state value: A set of group state flags that determine how a group is traversed during rendering or picking, or during computation of its bounding box or sphere.

handle storage object: A storage object that represents a handle to a dynamically allocated block of RAM.

hidden line removal: The process of removing any lines in a model that are hidden by opaque surfaces of objects.

hidden surface removal: The process of removing any surfaces in a model that are hidden by opaque surfaces of objects. Compare backface culling.

hierarchy: See QuickDraw 3D class hierarchy.

highlight state: An attribute having data of type TQ3Boolean that determines whether a highlight style overrides the material attributes of an object (kQ3True) or not.

highlight style: A type of QuickDraw 3D object that determines the material attributes of a geometric object (or a group of geometric objects) that override the normal attributes of the object (or group of objects).

high-order bit: See most significant bit.

hit: An object in a model that is close enough to the pick geometry. See also hit list.

hit data structure: A data structure that contains information about a hit. Defined by the TQ3HitData data type.hither plane The clipping plane closest to the camera.

hit information mask: A value that indicates the type of information you want returned for the items in a hit list.

hit list: A list of all objects in a model that are close to the pick geometry.

hit list sorting value: A value that determines the kind of sorting that is to

be done on a hit list.

hit path structure: A data structure that contains information about the path through a model hierarchy to a specific picked object. Defined by the TQ3HitPath data type.

hit testing: See picking.

hot angle: The half-angle (specified in radians) from the center of a spot light's cone of light within which the light remains at constant full intensity. See also fall-off value, outer angle.

identity matrix: Any $n \times n$ square matrix with elements a_{ij} such that $a_{ij} = 1$ if $i = j$ and $a_{ij} = 0$ otherwise. Compare inverse.

idle method: See file idle method, view idle method.

illumination shader: A shader that determines the effects of the view's group of lights on the objects in a model. Compare Lambert illumination shader, Phong illumination shader.

image: The two-dimensional product of rendering.

image plane structure: A data structure that contains information about an image plane. Defined by the TQ3ImagePlane data type.

immediate mode: A mode of defining and rendering a model in which the application maintains the only copy of the model data. See also retained mode.

immediate object: An object that is rendered in immediate mode. See also retained object.

infinite light: See directional light.

information group: A group that contains one or more strings (and no other types of QuickDraw 3D objects).

inherit: To have the data and methods of a parent class apply to a child class. Compare override.

inheritance: The property of the QuickDraw 3D class hierarchy whereby a child class inherits the data and methods of its parent class.

initial line: See polar axis.

inline: A method of executing groups that does not push and pop the graphics state stack before and after it is executed.

inline flag: A group state flag that determines whether or not a group should be executed inline. Compare drawable flag, picking flag.

inner product: See dot product.

input/output (I/O): The parts of a computer system that transfer data to or from peripheral devices.
instantiable class A class of which instances can be created. All leaf classes are instantiable, and many parent classes are instantiable as well. (For example, both the class TQ3AttributeSet and its parent class TQ3SetObject are instantiable.)

interacting: The process of selecting and manipulating objects in a model.

interactive renderer: A renderer that uses a fast and accurate algorithm for drawing solid, shaded surfaces. See also wireframe renderer.

interpolated shading: See Gouraud shading.

interpolation style: A type of QuickDraw 3D object that determines the method of interpolation a renderer uses when applying lighting or other shading effects to a surface.

intersection: The set of points that lie inside both of two given solid objects. The intersection of the objects A and B is represented by the function $A \llcorner B$. Compare complement, union.

inverse: For an $n \times n$ square matrix A with a nonzero determinant, the matrix B such that $AB = BA = I$, where I is the $n \times n$ identity matrix.

inverse matrix: See inverse.

I/O: See input/output.

I/O proxy display group: A display group that contains several representations of a single geometric object.

isometric projection: A type of orthographic projection in which the view plane is not perpendicular to any of the principal axes of the object being projected but makes equal angles with each of those axes. Compare elevation projection.

join point: See knot.

knot: A point on a curve that joins two segments of the curve.

knot vector: An array of numbers that defines a curve's knots.

Lambertian reflection: See diffuse reflection.

Lambert illumination: A method of calculating the illumination of a point on a surface based on diffuse reflection. Compare null illumination, Phong illumination.

Lambert illumination shader: An illumination shader that implements a Lambert illumination model. Compare null illumination shader, Phong illumination shader.

leaf class: A class that has no children.

leaf object: An instance of a leaf class.

leaf type: The object type of a leaf object.

least significant bit (LSB): The bit contributing the least value in a string of bits. Same as low-order bit. Compare most significant bit.

left-handed coordinate system: A coordinate system that obeys the left-hand rule. In a left-handed coordinate system, positive rotations of an axis are clockwise. Compare right-handed coordinate system.

left-hand rule: A method of determining the direction of the positive z axis (and thereby the front of a planar surface). According to the left-hand rule, if the thumb of the left hand points in the direction of the positive x axis and the index finger points in the direction of the positive y axis, then the middle finger points in the direction of the positive z axis. Compare right-hand rule.

light: See light object.

light attenuation: See attenuation.

light data structure: A data structure that contains basic information about a light. Defined by the TQ3LightData data type.

light fall-off: See fall-off value.

light group: A group that contains one or more lights (and no other types of QuickDraw 3D objects).

light object: A type of QuickDraw 3D object that you can use to illuminate the surfaces in a model. A light object is an instance of the TQ3LightObject class. See also ambient light, directional light, point light, spot light.

line: A straight segment in three-dimensional space defined by its two endpoints, with an optional set of attributes. Defined by the TQ3LineData data type.

line of projection: See projector.

little-endian: Data formatting in which each field is addressed by referring to its least significant byte. See also big-endian.

local coordinate system: The coordinate system in which an individual geometric objects is defined. Also called the object coordinate system or the modeling coordinatesystem. Compare camera coordinate system, window coordinate system, world coordinate system.

local space: See local coordinate system.

local-to-world transform: A transform that defines the relationship between an object's local coordinate system and the world coordinate system. Compare frustum-to-window transform, world-to-frustum transform.

low-order bit: See least significant bit.

LSB: See least significant bit.

luminance: The intensity of light in a color.

Macintosh draw context: A draw context that is associated with a Macintosh window.

Macintosh draw context data structure: A data structure that contains information about a Macintosh draw context. Defined by the TQ3MacDrawContextData data type.

Macintosh FSSpec storage object: A storage object that represents the data fork of a Macintosh file using a file system specification structure (of type FSSpec).

Macintosh storage object: A storage object that represents the data fork of a Macintosh file using a file reference number. Compare Macintosh FSSpec storage object.

mapping: The process of transforming one coordinate space into another.

marker: A two-dimensional object typically used to indicate the position of an object (or part of an object) in a window. Defined by the TQ3MarkerData data type.
matrix A rectangular array of numbers. QuickDraw 3D defines 3-by-3 and 4-by-4 matrices using the TQ3Matrix3x3 and TQ3Matrix4x4 data types.

matrix transform: Any transform specified by an affine, invertible 4-by-4 matrix.

memory storage object: A storage object that represents a dynamically allocated block of RAM. Compare handle storage object.

mesh: A collection of vertices, faces, and edges that represent a topological polyhedron. Defined by the TQ3Mesh data type.

mesh component: A collection of connected vertices in a mesh. Defined by the TQ3MeshComponent data type.

mesh corner: A mesh face together with one of its vertices. You can associate a set of attributes with a mesh corner. The attributes in a corner override any existing attributes of the associated vertex.

mesh edge: A line that connects two mesh vertices. A mesh edge is part of one or more mesh faces. Defined by the TQ3MeshEdge data type.

mesh face: A closed figure that forms part of a mesh. Unlike the faces of other geometric objects, mesh faces do not need to be planar. Defined by the TQ3MeshFace data type.

mesh iterator structure: A data structure used by QuickDraw 3D to maintain information when iterating through parts of a mesh. Defined by the

TQ3MeshIterator data type.

mesh part: See mesh part object.

mesh part object: A distinguishable part of a mesh. A mesh part object is an instance of the TQ3MeshPartObject class.

mesh vertex: A vertex (that is, a three-dimensional point) that is contained in a mesh. Defined by the TQ3MeshVertex data type.

metafile: A file format (that is, a description of the format of a kind of file). See also QuickDraw 3D Object Metafile.

metafile object: A basic unit contained in a file that conforms to the QuickDraw 3D Object Metafile.

metahandler: An application-defined function that QuickDraw 3D calls to build a method table for a custom object type. Compare attribute metahandler.

method: An item of data associated with a particular object class. The data is usually a function pointer or other information used by the object class.

metric pick: See metric pick object.

metric pick object: A pick object whose pick geometry has a pick origin.

model: A collection of synthetic three-dimensional geometric objects and groups of geometric objects. A model represents a prototype.

modeling: The process of creating a representation of real or abstract objects.

modeling coordinate system: See local coordinate system.

modeling space: See local coordinate system.
most significant bit (MSB) The bit contributing the greatest value in a string of bits. Same as high-order bit. Compare least significant bit.

move button: A button in the controller strip of a viewer object that, when clicked, puts the cursor into move mode. Subsequent dragging on an object in the picture area causes the object to be moved to a new location. Compare camera angle button, distance button, rotate button, zoom button.

MSB: See most significant bit.

natural attribute: An attribute that can naturally be contained in a set of attributes of a specific type.

natural surface parameterization: A parameterization of a surface that can be derived directly from the definition of the surface. Compare custom surface parameterization, standard surface parameterization.

near plane: See hither plane.

nonuniform rational B-spline (NURB): A curve defined by nonuniform parametric ratios of B-spline polynomials. NURB curves can be used to define very complex curves and surfaces, as well as very common geometric objects (for instance, the conic sections). See also control point, knot, NURB curve, NURB patch.

normal: (a.) Perpendicular. (n.) A normal vector.

normal file: A metafile in which the specification of an object in the file never occurs more than once. In other words, a file object that contains a table of contents that lists all multiply-referenced objects in the file. See also normal file, stream file.

normalized vector: A vector whose length is 1.

normal mode: The mode in which a normal file is opened. See also database mode, stream mode.

normal vector: A vector that is normal (that is perpendicular) to a surface or planar object at a specific point.

notice: A condition that is less severe than a warning, and that will likely not cause problems. See also error, warning.

notify function: See tracker notify function.

null illumination: A method of calculating the illumination of a point on a surface that depends only on the diffuse color of the point. Compare Lambert illumination, Phong illumination.

null illumination shader: An illumination shader that implements a null illumination model. Compare Lambert illumination shader, Phong illumination shader.

NURB: See nonuniform rational B-spline.

NURB curve: A three-dimensional curve represented by a NURB equation. Defined by the TQ3NURBCurveData data type.

NURB patch: A three-dimensional surface represented by a NURB equation. Defined by the TQ3NURBPatchData data type.

object: (1) See QuickDraw 3D object. (2) See metafile object. object coordinate system See local coordinate system.

object space: See local coordinate system.

object type: The identifier of the class of which a QuickDraw 3D object is an instance. Also called the class type.

oblique projection: A type of parallel projection in which the view plane is not perpendicular to the viewing direction. Compare orthographic projection.

off-axis viewing: A method of perspective projection in which the center of the projected object on the view plane is not on the camera vector.

opaque: (1) For a data structure, not publicly defined. You must use QuickDraw 3D functions to get and set values in an opaque data structure. For an object, having data and methods that are not publicly defined. (2) For a geometric object, not allowing light to pass through.

open: Said of a storage object whenever its associated storage is in use—for example, when an application is reading data from a file object attached to the storage object.

order: For a NURB curve or patch, one more than the highest degree equation used to define the curve or patch. For example, the order of a NURB curve defined by cubic polynomial equations is 4.

ordered display group: A display group in which the objects in the group are sorted by their type.

orientation style: A type of QuickDraw 3D object that determines which side of a planar surface is considered to be the "front" side.

origin: In Cartesian coordinates, the point (0, 0) or (0, 0, 0). The coordinate axes intersect at the origin.

original QuickDraw: See QuickDraw.

orthogonal: Perpendicular.

orthographic camera: A type of camera that uses orthographic projection.

orthographic camera data structure: A data structure that contains basic information about an orthographic camera. Defined by the TQ3OrthographicCameraData data type.

orthographic projection: A type of parallel projection in which the view plane is perpendicular to the viewing direction. Compare oblique projection. See also elevation projection, isometric projection.

outer angle: The half-angle (specified in radians) from the center of a spot light's cone to the edge of the cone. See also fall-off value, hot angle.

outer product: See cross product.

override: To define class data or methods that replace those of the parent class. Compare inherit.

QuickDraw 3D Glossary of Terms - T to Z (11/95)

Article Created: 17 November 1995

TOPIC -----

This article is a glossary of terms for QuickDraw 3D.

DISCUSSION -----

tangent: A line or plane that intersects a curve or surface at a single point.
Compare surface tangent.

tessellate: To decompose a curve or surface into polygonal faces.

text file: A file object whose data is a stream of ASCII characters with
meaningful labels for each type of object contained in the file. Compare binary
file.

texture: See texture object.

texture mapping: A technique wherein a predefined image (the texture) is mapped
onto the surface of an object in a model.

texture object: A type of QuickDraw 3D object used to perform texture mapping.
Compare pixmap texture object.

texture parameterization: A parametric function that maps the unit square to a
texture.

texture shader: A type of surface shader that applies textures to surfaces.

tolerance: See edge tolerance, vertex tolerance.

top elevation projection: A type of elevation projection in which the view plane
is parallel to the top of the object being projected. Also called plan elevation
projection.

tracker: See tracker object.

tracker coordinates: The current settings (that is, position and orientation) of a tracker.

tracker notify function: A function that is called whenever the coordinates of a tracker change by more than a specified amount.

tracker object: A QuickDraw 3D object that represents the position and orientation of a single element in your application's user interface. A tracker object is an instance of the TQ3TrackerObject class. See also controller object.

tracker serial number: A unique number that changes every time the coordinates of a tracker are updated by a controller.

tracker threshold: The amount by which a tracker's coordinates must change for the tracker notify function to be called.

transform: See transform object.

transform object: A type of QuickDraw 3D object that you can use to modify or transform the appearance or behavior of a QuickDraw 3D object. A transform object is an instance of the TQ3TransformObject class.

translate: To reposition an object by adding values d_x , d_y , and d_z to the x , y , and z coordinates of each of its points.

translate transform: A type of transform that translates an object along the x , y , and z axes by specified values.

transparency: The ability of an object to allow light to pass through it.

transparency color: A color of type TQ3ColorRGB that determines the amount of light that can pass through a surface. The color (0, 0, 0) indicates complete transparency, and (1, 1, 1) indicates complete opacity.

transpose: (n.) For an $m \times n$ matrix with elements a_{ij} , the $n \times m$ matrix with elements b_{ij} such that $b_{ij} = a_{ji}$. (v.) To form the transpose of a given matrix.

transpose matrix: See transpose.

triangle: A closed plane figure defined by three edges. Defined by the TQ3TriangleData data type.

trigrid: A grid composed of triangular facets. Defined by the TQ3TriGridData data type.

type: See object type.

under-color shader: A shader associated with some other shader that supplies an under color for surfaces shaded by that shader.

uniform scaling: A scale transform in which the scaling values d_x , d_y , and d_z are all identical. Compare differential scaling.

union: The set of points that lie inside either of two given solid objects. The union of the objects A and B is represented by the function $A \cup B$. Compare complement, intersection.

unit cube: A box whose three defining edges have a length of 1.

unit vector: See normalized vector.

UNIX path name storage object: A storage object that represents a file using a path name.

UNIX storage object: A storage object that represents a file using a structure of type FILE (defined in the standard I/O library). Compare UNIX path name storage object.

unknown object: A type of QuickDraw 3D object that is created when QuickDraw 3D encounters data it doesn't recognize while reading a metafile. An unknown object is an instance of the TQ3UnknownObject class.
up vector: A vector that indicates which direction is up. A camera has an up vector that defines its orientation. Compare camera placement.

user interface view: See user interface view object.

user interface view notify function: A function that is called whenever one of your user interface views needs to be redrawn.

user interface view object: A type of view that allows the user to interact (using interface elements such as a 3D cursor or widgets) with the 3D objects displayed in the view. A user interface view object is an instance of the TQ3UIViewObject class.

valid range: The range of u and v parametric values for a standard surface parameterization. For QuickDraw 3D, the valid range is the closed interval $[0.0, 1.0]$.

vector: A pair or triple of floating-point numbers that obeys the laws of vector arithmetic. Defined by the TQ3Vector2D and TQ3Vector3D data types. Compare cross product, dot product, normal.

vector-normal interpolation shading: See Phong shading.

vector product: See cross product.

vertex: A dimensionless position in three- or four-dimensional space at which two or more lines (for instance, edges) intersect, with an optional set of vertex attributes. Defined by the TQ3Vertex3D and TQ3Vertex4D data types. See also mesh vertex.

vertex attribute: An attribute that defines a characteristic of a vertex of a

polygonal object.

vertex index: In a mesh, a unique integer (between 0 the total number of vertices in the mesh minus 1) associated with a vertex. Compare face index.

vertex tolerance: A measure of how close two points must be for a hit to occur. Compare edge tolerance.

view: See view object.

view attribute: An attribute that defines a characteristic of a view object.

view-based shader: A shader that operates independently of the material properties or orientation of objects (in other words, that operates solely on aspects of the view, such as the camera position). Compare surface-based shader.

viewing box: The rectangular box defined by an orthographic camera and the hither and yon clipping planes. Compare viewing frustum.

view coordinate system: See camera coordinate system.

viewer: See viewer object.

Viewer: See 3D Viewer.

viewer badge: See badge.

viewer controller strip: See controller strip.

viewer flags: A set of bit flags that specify information about the appearance and behavior of a viewer object.

viewer frame: See viewer pane.
viewer object An instance of the 3D Viewer. A viewer object is of type ViewerObject.

viewer pane: The portion of a window occupied by a viewer object. The pane includes the picture area and the controller strip.

viewer state flags: A set of bit flags returned by the Q3ViewerGetState function that specify information about the current state of a viewer object.

viewing frustum: The rectangular frustum defined by a perspective camera and the hither and yon clipping planes. Compare viewing box.

view hints object: An object in a metafile that gives hints about how to render a scene.

view idle method: A callback routine that is called during lengthy rendering operations. Compare file idle method.

view information structure: A data structure that contains information about a view. Defined by the TQ3ViewInfo data type.

viewing direction: The direction of a view's camera. Also called the camera vector or the viewing vector.

viewing vector: See viewing direction.

view mapping matrix: A matrix maintained by QuickDraw 3D that transforms the viewing frustum into a standard rectangular solid. The world-to-frustum transform is the product of the transforms specified by the view orientation matrix and the view mapping matrix. Compare view orientation matrix.

view object: A type of QuickDraw 3D object used to collect state information that controls the appearance and position of objects at the time of rendering. A view object is an instance of the TQ3ViewObject class.

view orientation matrix: A matrix maintained by QuickDraw 3D that rotates and translates a view's camera so that it is pointing down the negative z axis. The world-to-frustum transform is the product of the transforms specified by the view orientation matrix and the view mapping matrix. Compare view mapping matrix.

view plane: The plane onto which a model is projected. Also called the projection plane.

view plane camera: A type of perspective camera defined in terms of an arbitrary view plane.

view plane camera data structure: A data structure that contains basic information about a view plane camera. Defined by the TQ3ViewPlaneCameraData data type.

view plane coordinate system: The two-dimensional coordinate system whose origin is the point at which the viewing direction intersects the view plane and whose positive y axis is parallel to the camera's up vector.

view port: See camera view port.

view space: See camera coordinate system.

view status value: A value returned by the Q3View_EndRendering function that indicates whether the renderer has finished processing the model.view volume The part of world space that is projected onto the view plane during rendering. See also view box, view frustum.

virtual: See synthetic.

virtual camera: See camera object.

visual line determination: See hidden line removal.

visual surface determination: See hidden surface removal.

warning: A condition that, though less severe than an error, might cause an

error if your application continues execution without handling the warning. See also error, notice.

widget: An element of an application's 3D user interface.

window coordinate system: The coordinate system defined by a window. Also called the screen coordinate system or the draw context coordinate system. Compare camera coordinate system, local coordinate system, world coordinate system.

window picking: See screen-space picking.

window-point pick data structure: A data structure that contains information about a window-point pick object. Defined by the TQ3WindowPointPickData data type.

window-point pick object: A pick object that tests for closeness between a point in a window and the screen projections of the objects in the model.

window-rectangle pick data structure: A data structure that contains information about a window-rectangle pick object. Defined by the TQ3WindowRectPickData data type.

window-rectangle pick object: A pick object that tests for closeness between a rectangle in a window and the screen projections of the objects in the model.

window space: See window coordinate system.

wireframe renderer: A renderer that creates line drawings of models. See also interactive renderer.

world coordinate system: The coordinate system that defines the locations of all geometric objects as they exist at rendering or picking time, with all applicable transforms acting on them. Also called the global coordinate system or the application coordinate system. Compare camera coordinate system, local coordinate system, window coordinate system.

world space: See world coordinate system.

world-space subdivision: A method of subdividing smooth curves and surfaces according to which the renderer subdivides a curve (or surface) into polylines (or polygons) whose sides have a world-space length that is at most as large as a given value. Compare constant subdivision, screen-space subdivision.

world-to-frustum transform: A transform that defines the relationship between the world coordinate system and the frustum coordinate system. Compare frustum-to- window transform, local-to-world transform.

wrap: For a shader effect, to replicate the entire effect across the mapped area. Compare clamp.

writing loop: A section of code in which all writing takes place. A writing loop begins with a call to the Q3View_StartWriting routine and should end when a call to Q3View_EndWriting returns some value other than kQ3ViewStatusRetraverse. A

writing loop is a type of submitting loop. See also bounding loop, picking loop, rendering loop.

x axis: In Cartesian coordinates, the horizontal axis.

y axis: In Cartesian coordinates, the vertical axis.

yon plane: The clipping plane farthest away from the camera.

z axis: In Cartesian coordinates, the axis that represents depth.

zoom button: A button in the controller strip of a viewer object that, when clicked, puts the cursor into zooming mode. Subsequent dragging up or down in the picture area causes the camera's field of view to increase or decrease. Compare camera angle button, distance button, move button, rotate button.

Macintosh Performa: Kidsoft Extension and Type 11 (11/95)

Revised: 11/20/95
Security: Everyone

Macintosh Performa: Kidsoft Extension and Type 11 (11/95)

=====

Article Created: 17 November 1995

TOPIC -----

When I start up my Power Macintosh 5200/75 LC computer, I get the message, "Volume 3 Issue 4, Type 11." I can only start up my computer if I disable extensions. What is causing this?

DISCUSSION -----

Within the Extensions folder in your System Folder, check to see if you have a file called, "Volume 3 Issue 4". If so, remove it because it is likely the cause of the error. This file appears to be installed from the KidSoft CD, and you should contact KidSoft for additional assistance.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Newton 2.0 OS: No Meetings Shorter than 30 Minutes (8/96)

Revised: 8/27/96
Security: Everyone

Newton 2.0 OS: No Meetings Shorter than 30 Minutes (8/96)

=====

Article Created: 20 November 1995
Article Reviewed/Updated: 27 August 1996

TOPIC -----

I am using the Newton 2.0 OS, and I having trouble making a meeting in the Dates area less than 30 minutes. How can I do this?

DISCUSSION -----

When creating a meeting (by drawing a line over the desired meeting time), the graphic user interface displays meetings as being 30 minutes or longer. If you edit the meeting, in the meeting slip, and specify the meeting is less than 30 minutes, when you close the meeting slip, the meeting time goes back to the minimum 30 minute meeting. This time limitation is in the OS, and there is no supported method of changing this restriction. A 30 minute meeting ensures that the vertical bar is of sufficient size, and leaves room for the meeting icon and the meeting title.

Newton 2.0 OS: Make Backdrop Location (11/95)

Revised: 11/20/95
Security: Everyone

Newton 2.0 OS: Make Backdrop Location (11/95)

=====

Article Created: 20 November 1995

TOPIC -----

This article describes the location of the built-in Make Backdrop option in the Newton 2.0 OS (Operating System).

DISCUSSION -----

The Backdrop application is the one which appears on the MessagePad screen when you power on your Newton PDA (Personal Digital Assistant).

In the Newton 2.0 OS, the Make Backdrop option is located in the Memory Info area, in the Extras drawer. You can get to the Memory Info area by tapping on the 'i' in the lower right corner of the MessagePad screen.

Apple chose to put the backdrop option in the memory area instead of a setup area since users may want to change the built-in make backdrop over a period of time, not just during the setup.

Color LW 12/600 PS: Changing Trays With PostScript (4/97)

Revised: 4/14/97
Security: Everyone

Color LW 12/600 PS: Changing Trays With PostScript (4/97)

Article Created: 20 November 1995
Article Reviewed/Updated: 14 April 1997

TOPIC -----

This article explains how to use PostScript commands to print from a specific paper tray on the Color LaserWriter 12/600 PS printer either by default, or on a per-job basis.

DISCUSSION -----

In order to change the paper tray for one job, you can use the following PostScript code fragments. This was taken from the Color LaserWriter 12/600 PS PPD. You need to insert the code at the beginning of your print job.

CAUTION:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

250 Page Tray

Begin_Table

```
%=====
% Begin PostScript code
%
currentpagedevice /InputAttributes get 0 get
dup null eq
{ pop }
{ dup length 1 add dict copy
  dup /InputAttributes
  1 dict dup /Priority [0 1 2] put
  put setpagedevice
} ifelse
```

```
%
% End PostScript code
%=====
```

Multipurpose Tray

```
%=====
% Begin PostScript code
%
  currentpagedevice /InputAttributes get 1 get
  dup null eq
  { pop }
  { dup length 1 add dict copy
    dup /InputAttributes
    1 dict dup /Priority [1 0 2] put
    put setpagedevice
  } ifelse
%
% End PostScript code
%=====
```

Optional Tray

```
%=====
% Begin PostScript code
%
  currentpagedevice /InputAttributes get 2 get
  dup null eq
  { pop }
  { dup length 1 add dict copy
    dup /InputAttributes
    1 dict dup /Priority [2 0 1] put
    put setpagedevice
  } ifelse
%
% End PostScript code
%=====
```

Changing Default Tray

If you wish to change the default paper tray,

This is PostScript Level 1 code:

```
%=====
% Begin PostScript Code
%
```

```
serverdict begin 0 exitserver
statusdict begin n setdefaultpapertray end
%
% end PostScript Code
%=====
```

End_Table

Replace "n" before "setdefaultpapertray" based on the following table:

```
0 (StandardCassette)
1 (Multipurpose)
2 (OptionalCassette)
```

This changes the default paper tray permanently, or until you use this PostScript code to change the default tray again.

This is the equivalent PostScript Level 2 code:

```
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=====
```

This sets the paper tray priority to:

1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".

For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

Article Change History:

14 Apr 1997 - Added PostScript Level 2 code.

PowerTalk to MS Mail Gateway & MS Mail on Novell Server (11/95)

Revised: 11/21/95
Security: Everyone

PowerTalk to MS Mail Gateway & MS Mail on Novell Server (11/95)

=====

Article Created: 21 November 1995

TOPIC -----

We are trying to setup the Microsoft (MS) Mail Gateway 1.6 for use with PowerTalk 1.1. Our clients are Power Macintosh 7100/80 computers, the MS Mail Server is running on a Novell 4.1 Server.

The users can see the MS Mail Server in the chooser, but they cannot see the mail server in the keychain. Are there versions of PowerTalk that are not compatible with this setup, or are there problems with the MS Post Office running on a Novell 4.1 Server?

DISCUSSION -----

Your issue is in running the MS Mail Server on a Novell 4.1 Server. The MS Mail to PowerTalk gateway only connects to an MS Mail Server running on a Macintosh.

System 7.5.x: Documents Save to Preferences (11/95)

Revised: 11/20/95
Security: Everyone

System 7.5.x: Documents "Save to" Preferences (11/95)

=====

Article Created: 20 November 1995

TOPIC -----

I have the General Controls control panel set to save in the "Last folder used in the application", but it is not doing it. Where does this setting get stored? What do the three choices mean?

DISCUSSION -----

The Documents section of the System 7.5.x General Controls control panel sets which folder will be offered as the default location to be saved to when you save a document. There are three options to choose from:

- 1) The choice "Folder which contains the application" saves your document in the same folder which the application resides.
- 2) "Last folder used in the application" refers to the last folder to which the current application saved a document. Information for each application you use is stored in the General Controls Prefs file in the Preferences Folder of your System Folder. If this file is corrupted, the computer may revert to the last folder saved to by some other application. You can resolve this by dragging the General Controls Prefs file to the trash but you will loose the preferred folder settings for all your applications. This file will be recreated and updated as you save files in your applications again.
- 3) The last choice, "Documents folder" saves all documents to a folder called "Documents" that is created on your desktop. You can move the Documents folder and the General Controls control panel will locate it. If there is no Documents folder when you save a document, one is created on your desktop.

ColorSync: Profile Keeps Resetting to 13" RGB (11/95)

=====

Article Created: 20 November 1995

TOPIC -----

The System Profile in my ColorSync System Profile control panel keeps reverting back to Apple 13" RGB Standard. I cannot find a preference file to trash. Where is this information saved and how do I solve this issue?

DISCUSSION -----

The System Profile selection is stored in the ColorSync extension itself. Drag the ColorSync extension to the Trash and re-install it from your backup system software or display software installer. You will have to reselect your display type in the ColorSync System Profile control panel but it will now save your setting.

Apple Business Education Bundle: Where Are the Templates? 11/95

Revised: 11/20/95
Security: Everyone

Apple Business Education Bundle: Where Are the Templates? 11/95

=====

Article Created: 20 November 1995

TOPIC -----

According to the "Computing with Clarisworks" textbook that comes with the Apple Business Education Bundle, the bundle is supposed to come with a set of curriculum templates students use when going through that textbook. However, I cannot find where the Business Education Bundle installer CD places these templates. Where are they?

DISCUSSION -----

The curriculum templates are not installed onto the hard drive by the Business Education Bundle installer. Apple released an update floppy disk that installs three missing folders that the Business Education Bundle installer fails to install. During the week of October 30, 1995, Apple sent all Business Education customers (1 diskette per location) an update diskette entitled "Business Education Bundle Update Diskette," along with a letter explaining this issue. By the end of January 1996, you should receive the update diskette and letter.

You can install the folders included with the update disk by following these steps:

Step 1

Turn on your computer and insert the floppy disk.

Step 2

Double-click the disk icon when it appears on your desktop.

Step 3

Click and hold on one of the folders and drag it to your hard drive icon.

Step 4

Release the mouse button.

Step 5

The folder will now appear on your hard drive.

Step 6

Repeat steps 3-5 for the two remaining folders.

If you have not received the update floppy, the templates can still be accessed directly from the CD-ROM disc by using the following procedure:

Step 1

Launch Clarisworks.

Step 2

Insert the Business Education Bundle CD-ROM disc into the CD-ROM drive.

Step 3

Choose the Open command from the File menu.

Step 4

Click the "Desktop" button in the open dialog box. Double-click on the Business Education Bundle CD.

Step 5

Open the Clarisworks Templates folder. Scroll to locate the correct chapter/lesson and double-click the template the textbook is referring to.

Macintosh Guide: How to Access It (11/95)

Revised: 11/20/95
Security: Everyone

Macintosh Guide: How to Access It (11/95)

=====

Article Created: 17 November 1995

TOPIC -----

I was told to use Macintosh Guide to learn how to use my computer, but I cannot find it. What should I do?

DISCUSSION -----

Macintosh Guide is a System 7.5.x Apple Guide help file which is accessed through the Guide menu (the question mark in upper right hand corner of your screen) while you are in the Finder. The Finder is the operating environment which shows your desktop icons, such as your Trash can. The Macintosh Guide is not displayed as an option if you are currently in another application. If the application developer included it, you would find a Guide file for that application in place of the Macintosh Guide.

You can determine whether the Finder is the current application by clicking on the Application menu (to the right of the question mark in the menu bar). The currently-running application will have a check-mark next to it. If Finder does not have a check-mark next to it, drag down to it, and release the mouse. You should then be able to click on the Help menu and see Macintosh Guide.

If Macintosh Guide is not an option in the Guide Menu, it may have been disabled. For Macintosh Guide to be an option, these two files must be present in the Extensions folder of your System Folder:

- Apple Guide
- Macintosh Guide

If one or both of these files are missing from this folder, Macintosh Guide will not be available. You will need to use the Custom Install feature of your backup disks or system software CD to re-install the Utility files.

You must also make sure that Apple Guide is not disabled in the Extensions Manager. Use the following steps to verify this:

Step 1

Choose Control Panels from your Apple Menu.

Step 2

Open the Extensions Manager control panel.

Step 3

See if Apple Guide is listed under the "Extensions" list.

If it is, make sure there is a check-mark next to the file, then close the Extensions Manager and restart your computer.

Once you have Macintosh Guide installed, you can choose it from your Help menu and use the Look For command to search for topics of interest.

Macintosh Performa 6205CD: Technical Specifications (4/97)

Revised: 4/28/97
Security: Everyone

Macintosh Performa 6205CD: Technical Specifications (4/97)

Article Created: 20 November 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article contains the technical specifications for the Macintosh Performa 6205CD computer.

DISCUSSION -----

Microprocessor

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus

Memory

- 8 MB RAM
- Expandable up to 64 MB (32 MB x 2 slots)
- Two 72-pin SIMM slots, 80 ns or faster
- Expandable one SIMM at a time
- 32-bit memory bus

Storage

- 1.4 MB Apple SuperDrive disk drive - read and write MS-DOS disks
- 1.2 GB IDE hard drive, 1/3 height
- AppleCD 600i CD-ROM drive (Quad Speed)

Expansion & Ports

- LC processor direct slot
- Video-in slot for optional video capture card
- TV tuner slot
- Communications slot
- SCSI interface for connecting up to five external devices

- One serial (RS-232/RS-422) printer port*
- ADB port
- Sound-in (PlainTalk compatible)
- Sound-out

* Note:

The modem serial port is disabled with an internal modem installed in the Communications Slot.

Video

- 1 MB DRAM video frame buffer
- 16-bit color at 640x480, 8-bit color at 800x600, 832x624
- Supports Video In with optional card
- Apple Multiple Scan 15 Display included

Sound

- 16-bit CD audio
- 16-bit sound out and internal**
- PlainTalk (or line level) microphone required

** Note:

The Macintosh User's Guide for Macintosh Performa 6200CD computers incorrectly states that these computers have 8-bit sound.

Communications

- External 28.8K baud fax/data modem.

Ergonomic Features

- Front controls for volume and contrast
- Front headphone jack
- Infrared remote control
- Power on/off from keyboard

Keyboard

- Includes AppleDesign Keyboard
- Supports all Apple Desktop Bus (ADB) keyboards

Mouse

- Apple Desktop Mouse 11

Clock/Calendar

- CMOS customer chip and battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.

- Third-party options provide alternative input and output devices

Electrical Requirements

- 110 - 240v, 50 - 60 Hz
- Power consumption 45 watts max (excluding monitor)
- EPA Energy Star compliant

ADB Power Requirements

- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA
- Keyboard draws 10mA

Size and Weight

- Height: 4.3 in. (10.95 cm)
- Width: 12.6 in. (32 cm)
- Depth: 16.5 in. (41.95 cm)
- Weight: 19 lb. (8.6 kg)

Operating Environment

- 10 to 40 deg. C (50 to 104 deg. F)

System Software

- Mac OS System 7.5.1 with Apple Guide, AppleScript and PC Exchange included

Third-party software bundles

=====

Begin_Table

SOFTWARE TITLES

- | | |
|---------------------------------------|-----------------------|
| • At Ease 2.0.3 | • Mangia v.1.2.3 |
| • Newton Tour 1.1 | • Virex 5.5.3P2 |
| • Ram Doubler Demo | • Espresso 1.0 |
| • Widget Workshop 1.0 | • ClarisWorks 3.0v1 |
| • WealthBuilder/Reuters 4.0 | • Power Pete 1.0A |
| • MacTess Home Learning Software 2.5c | • Fine Artist 1.0 OEM |
| • MacLink Plus 8.0.2 | • Writing Center 1.04 |
| • Click Art Performa Collection | • Quicken 5.0r5P |
| • MacGallery Clip Art Treasure Pak | |

End_Table

The Macintosh Performa 6205CD comes with eight (8) CD titles, including:

- The 1995 Grolier Multimedia Encyclopedia
- Electronic Arts 3D Atlas
- The Family Doctor
- Smithsonian's America

- Club KidSoft Sampler
- Thinkin' Things Collection 2
- My First Incredible, Amazing Dictionary
- Professor Piccolo

Product specifications are subject to change. Check with an Apple reseller for the most current information about product specifications and configurations.

LaserWriter Pro 810: SCO UNIX 3.2 Error Code 2 (11/95)

Revised: 11/20/95
Security: Everyone

LaserWriter Pro 810: SCO UNIX 3.2 Error Code 2 (11/95)

=====

Article Created: 20 November 1995

TOPIC -----

I have installed the LaserWriter Pro 810 software on a computer using SCO UNIX 3.2 version 2, and I keep getting an error message sent to me from the root when I try to print PostScript. Why?

DISCUSSION -----

The error message you are getting:

"Your request <print job name> destined for <printer name> encountered an error while printing on printer <printer name>. Printing stopped with an exit code of 2." (Error code 2 is file not found.)

Solution
=====

Step 1

Replace the /etc/printcap file with an original copy

Step 2

Reinstall the LaserWriter 810 software to a directory called /usr/apple

Step 3

Rerun the software installation (eninstall -b)

Running from the hard wired /usr/apple location appears to make the correct printcap entries, so no errors are reported.

System 7.5.2: ImageWriter LQ driver isn't included (5/96)

Revised: 5/8/96
Security: Everyone

System 7.5.2: ImageWriter LQ driver isn't included (5/96)

Article Created: 20 November 1995
Article Reviewed/Updated: 8 May 1996

TOPIC -----

System 7.5.2 does not seem to include a driver for my LQ ImageWriter, or LQ AppleTalk ImageWriter printers. Where can I get a compatible driver for this computer?

DISCUSSION -----

The following drivers are compatible with the corresponding printers and System 7.5.2. The following drivers are all available from Apple Online Support areas. System 7.5.2 also does not include an AppleTalk Imagewriter driver.

ImageWriter LQ

LQ ImageWriter	7.0.1	Serial
ImageWriter LQ GX	1.1.1	Serial
LQ AppleTalk ImageWriter	7.0.1	LocalTalk

ImageWriter

AppleTalk ImageWriter	7.0.1	LocalTalk
-----------------------	-------	-----------

Article Change History:
08 May 1996 - Added AppleTalk ImageWriter driver to article.

DOS Compatibility Card: Floppy Disk Read/Write Issue (4/97)

Revised: 5/2/97
Security: Everyone

DOS Compatibility Card: Floppy Disk Read/Write Issue (4/97)

Article Created: 20 November 1995
Article Reviewed/Created: 2 May 1997

TOPIC -----

I cannot reliably copy files to a floppy disk in the PC environment of my Power Macintosh 6100 DOS Compatible computer. When I try, I either get an error message or the system hangs completely.

DISCUSSION -----

Keeping in mind that almost all floppy disk read or write issues in the PC environment of the Power Macintosh 6100 DOS Compatible computer are related to either RAM compression programs, or virus checking software. Try these troubleshooting steps:

Step 1

Start the computer while pressing and holding the space bar. This will activate the Extensions Manager control panel before extensions and control panels load, letting you choose which extensions or control panels will be enabled. In the Sets pop-up menu choose System 7.5 Only. Now select the additional extensions and control panels below by putting a check mark to the left of each:

Find File Extension
PC Clipboard
PC Print Spooler
PC Setup

Close the Extensions Manager control panel and let the computer finish starting up. Insert a floppy disk and try to read or write from the PC environment. If you are now able to copy or format disks reliably, you may be experiencing an extension or control panel conflict. To determine which extension or control panel is in conflict, use the Extensions Manager control panel and enable the extensions one at a time until your computer exhibits the symptoms you are having. The last extension or control panel added is the conflicting item and

should not be used. If this does not resolve the issue continue to the next step.

Step 2

Reset the computers parameter random access memory (PRAM). To do this in System 7 or later, press and hold the control, option, P, and R keys while restarting the computer. Continue pressing these keys until you hear the startup chime a second time, then release the keys. Once the computer has finished its startup process, open the PC Setup control panel. You should receive a dialog indicating the PC software did not load properly, click OK, and close the PC Setup control panel. Restart the computer and insert a floppy disk and try to read or write from the PC environment. If this does not resolve the issue continue to the next step.

Step 3

Create a new PC drive container, and install DOS onto it. Start the PC environment from the new container just created as the C: drive. Insert a floppy disk and try to read or write from the PC environment. If this resolves the issue, use this new container as your C: drive. For help on creating a new drive container, refer to Creating a Drive Container on page 32 of the "DOS Compatibility Card for Macintosh User's Guide." If this does not resolve the issue continue to the next step.

Step 4

Perform a clean installation of the Mac OS software for the Macintosh environment. Also re-install the software from the DOS Compatibility Card installer disk for Macintosh. For assistance, see Installing Macintosh OS Software on page 31 of the "DOS Compatibility Card for Macintosh User's Guide."

If you need assistance re-installing system software, search the Apple Tech Info Library with the search string "system 7.5 and clean install procedure" to locate the article titled, "System 7.5: Clean Install Procedure."

MacX 1.5 and Connect With XDMCP: Key Mapping Issue (11/95)

Revised: 11/21/95
Security: Everyone

MacX 1.5 and Connect With XDMCP: Key Mapping Issue (11/95)

Article Created: 21 November 1995

TOPIC -----

When using MacX 1.5 and the XDMCP protocol to connect to a workstation, I noticed that some of my keys no longer work. If I use a remote command like xterm, I do not have this key mapping issue. Why are the key mappings different.

DISCUSSION -----

We believe the XDM settings have mapped the keys differently. To correct this, follow the following steps:

Step 1

Connect with a remote xterm command, so the keys mappings are correct.

Step 2

Type the command:

```
xmodmap -pke > $HOME/mykeymap
```

This command will output your key mappings to a file.

Step 3

Create a file called '.xsession' in you HOME directory.

Step 4

In .xsession, enter this line: 'xmodmap mykeymap'

Step 5

Save this file, make it executable and exit.

Step 6

Connect again with XDMCP. The Xsessions file will read the user's .xsession file, issuing the command to execute the command xmodmap and map the users working key map.

TCP/IP Control Panel: No Zone Information (4/96)

Revised: 4/4/96
Security: Everyone

TCP/IP Control Panel: No Zone Information (4/96)

=====

Article Created: 21 November 1995
Article Reviewed/Updated: 4 April 1996

TOPIC -----

AppleTalk control panel reports proper Ethernet zone, the Chooser shows zones available, but TCP/IP control panel shows no zones to select. This happens with Open Transport 1.0.6, 1.0.7, and 1.0.8. Why does this happen and is this going to be fixed?

Also the Apple LAN Utility lets you manually configure the Ethernet address. When saving the new address, a dialog box says "save changes to LAN Built-In". Where is this information saved?

DISCUSSION -----

There was a bug that affects the ability to see zones in the TCP/IP control panel if there are more than 512 zones on the internet. This bug is fixed in Open Transport 1.1, and you should upgrade to it.

The Apple LAN Utility writes the data to the ecfg resource stored in the Ethernet driver itself.

Article Change History:
04 Apr 1996 - Added OT 1.1 fix, and changed distribution.

Power Macintosh 5200, 5300, and 6200: Read Me (12/95)

Revised: 12/18/95
Security: Everyone

Power Macintosh 5200, 5300, and 6200: Read Me (12/95)

=====

Article Created: 22 November 1995
Article Reviewed/Updated: 18 December 1995

TOPIC -----

This is the Read Me file for the Power Macintosh 5200/75 LC, 5300/100 LC, and the 6200/75 LC series computers.

DISCUSSION -----

Important Information About Your Macintosh
=====

Congratulations on purchasing your computer. This document adds to and updates the information in the manual that came with your computer. It is a good idea to read this document now, and keep a copy handy for future reference.

System Software CD (or Disks)

Your Macintosh came with system software on either a CD or floppy disks. Since this software is also installed on your hard disk, you won't need to use the system software CD or disks unless you have a problem with your system software. If you need to reinstall system software, be sure to start with the Apple Macintosh CD (or the Install Disk 1 floppy disk). For instructions, see the information on installing system software in your user's guide.

Note: The CD contains all the information from all the system software disks (and possibly, some additional programs). If you received a system software CD, use your CD in any steps that refer to a specific disk mentioned below.

Disk Tools Disk

Your Apple Macintosh CD also includes utilities for formatting and repairing hard disks. (Alternately, if you received a system software disk set, one of the disks is the Disk Tools disk). Don't use the Apple Macintosh CD or Disk Tools disk during your normal computer use, or regularly start up your computer using

the CD or disk. (If you do, your computer may not operate properly.)

Your Internal Hard Disk and the Drive Setup Program

Your computer's internal hard disk is based on IDE (Integrated Device Electronics) technology. You can use the Drive Setup application program included on your Apple Macintosh CD or Disk Tools disk to check your internal IDE hard disk for damage (and to format the disk if you ever need to do so). Some utility programs, such as Apple HD SC Setup, will not work with IDE hard disks. Before you purchase any hard disk utility program for this computer, make sure it's compatible with IDE hard disks.

Note: If you start your computer from an external SCSI hard drive and—while attempting to reinitialize your internal hard disk—receive a message that initialization failed, check to make sure you do not have filesharing or a modem turned on. If you do, turn off filesharing or the modem and try the reinitialization again.

Apple Video Player

The Apple Video Player lets you view video and capture video images or sequences if you have a video input card installed in your Macintosh. Additionally, if you have a TV tuner card installed, you can also watch TV, capture TV images or sequences on your computer, and manage channel access. Apple Video Player comes installed on your computer's hard disk. See the Read Me file in the Apple MPEG Media Software 1.0, MPEG Software, Video Software folder for more information on Apple Video Player.

Video viewing and video capture are supported in windows sized up to 640 x 480 pixels. Turn off virtual memory when capturing video and record in Smallest window size for best results.

For the highest-quality video (and TV) viewing and video capture, use the standard video window sizes (Smallest, Normal, or Largest) in Apple Video Player's Windows menu. If you customize the window size (by choosing Other in the Windows menu), the image's resolution will decrease.

Video resolution is best when you view the Apple Video Player video window on the monitor connected to the monitor port on your Macintosh. You can drag the video window to a secondary monitor (connected to an expansion card), but the image resolution will decrease.

Reinstalling the MPEG Media System Software or Apple Video Player Software

=====

To install the latest MPEG, Apple Video Player, and CD-ROM Software

Step 1

Double click on the "Installer" icon in the Apple MPEG Media Software 1.0 folder. The installer dialog will appear on your screen.

Step 2

Click on the "Install" button. The MPEG Media System, CD-ROM, and Apple Video Player software will be automatically installed.

Step 3

When the installer has finished copying the software to your system, it will force a restart of the machine.

To install only the Apple Video Player Software

Step 1

Double click on the "Installer" icon in the Apple MPEG Media Software 1.0 folder. The installer dialog will appear on your screen.

Step 2

In the upper left corner of the installer dialog select "Custom Install" from the pop-up menu.

Step 3

The custom install screen will appear.

Step 4

Click on the "Apple Video Player" checkbox.

Step 5

Click on the "Install" button. The Apple Video Player software will be automatically installed.

Step 6

When the installer has finished copying the software to your system, it will force a restart of the machine.

Apple Video Player Hot Key

=====

The Apple Video Player application program allows you to use a keyboard shortcut (called a "hot key") to open and quit the program, and to switch between Apple Video Player and any other open programs. Due to potential incompatibility problems, the Hot Key is not enabled by default. To select a Hot Key setting, launch the Apple Video Player from the Apple menu (🍏). Select the "Hot Key..." menu item from the "Setup" menu. In response to the dialog that appears, simply press the key combination you want to use to turn Apple Video Player on and off.

Apple Video Player Closed Captioning

=====

If you have a TV tuner card, the Apple Video Player application program can display closed captions for TV channels that provide them. To see closed captions on the screen, the video window size must be set to Normal Size or greater. Also, for best results, networking or printing should not be active when you select close captioning.

Apple Video Player - Capturing Movies

=====

The Apple Video Player program can capture video images or sequences. For best results, networking (including use of a modem) or printing should not be active when you are recording video from either television or another video source. Virtual memory should also be turned off when capturing video. Recording in Smallest window size will also improve the quality of captured video.

Playing Audio CDs on an External CD-ROM Drive

=====

If you connect an external CD-ROM drive to your Macintosh, and wish to play audio CDs using the AppleCD Audio Player, you will need to drag the External CD Sound extension into your Extensions folder. To do this:

Step 1

Open the Apple Extras folder on your hard drive.

Step 2

Drag the External CD Sound extension into your System Folder.

Step 3

Select "OK" in response to the dialog which prompts you to store the extension into the Extensions folder.

Step 4

Restart your Macintosh.

AppleShare Server Software and Virtual Memory

=====

If you want to use AppleShare to set up your Macintosh for file sharing or print-sharing on a network, you must use AppleShare Server Software version 4.0.2 or later. If you are using version 4.0.2, be sure to turn off Virtual Memory, or you may experience memory problems.

NOTE: This note is not part of the original Read Me, it is being added to correct information presented here. AppleShare 4.0.2 for Power Macintosh is no longer sold separately and is not available from Apple Computer. Later versions of AppleShare, v 4.1 or 4.2, are not supported on these computers.

Using Slide Show Viewer with Photo CDs

=====

If you use the Slide Show Viewer to view Photo CD images, it may take awhile to

launch the viewer the first time it is used. Once launched initially, a preferences file is created, and subsequent launches should be much faster.

Using an Internal Express Modem

=====

If you install an Express Modem in the internal communications slot of your computer, you should use version 1.5.4 or later of the Express Modem software. Apple Telecom 2.0 software also supports the internal Express Modem. If you install using this version, select the Custom Install option and then select the "Express Modem Software for internal modems" item for installation.

Article Change History:

18 Dec 1995 - Added correction on AppleShare.

Power Mac 5200, 5300, & 6200: Software Updates Read Me (11/95)

Revised: 3/20/96
Security: Everyone

Power Mac 5200, 5300, & 6200: Software Updates Read Me (11/95)

=====

Article Created: 22 November 1995

TOPIC -----

This article provides information about the software updates on the system software CD for the Power Macintosh 5200/75 LC, 5300/100 LC, and the 6200/75 LC series computers.

DISCUSSION -----

About the Macintosh Software Updates

This document provides important information about some system files installed on your computer.

When you are finished reading and printing this document, choose Quit from the File menu to quit the SimpleText application program.

The following system extensions and control panel have been installed on your computer's hard disk:

- At Ease 7.5 Layer Patch: if you have At Ease installed on your machine this extension fixes a potential problem when trying to launch an application or selecting the menu item "Go To Finder" with At Ease. This is only a problem if you have desktop hiding enabled in the General Controls control panel.
- Processor Info Extension: fixes a potential problem that could cause your computer to report back the incorrect processor and bus speeds.
- Audio Volume Extension: if you have an internal modem installed (not related to Express modem), this extension fixes a problem where no sound is emitted by the modem. This extension also fixes a potential problem where poor sound quality may be heard.
- Screen Control Panel: fixes a problem that could cause your computer to behave

incorrectly when Screen Power Saver mode is enabled.

If you reinstall system software, you should also reinstall these files. To reinstall, drag each file into your System folder. Click OK when you are asked whether to put each file in their respective folders.

Apple Modem Tool 1.5.3: Read Me File (11/95)

Revised: 11/22/95
Security: Everyone

Apple Modem Tool 1.5.3: Read Me File (11/95)

Article Created: 22 November 1995

TOPIC -----

This article contains the ReadMe file for the Apple Modem Tool extension v1.5.3.

DISCUSSION -----

Apple Modem Tool 1.5 improves reliability and performance through support of the Microcom Networking Protocol (MNP levels 1 through 4) and CCITT v.42bis data compression protocol.

It features an enhanced user interface that provides support for user-installed modem definitions and provides easy access to a list of phone numbers of the services you wish to contact.

The Details

- Support for MNP using a modified version of the .MNP driver from ARA 1.0.

The .AMT driver is installed in the DCE the first time the Apple Modem Tool is used after a reboot. It contains several modifications provided by the Newton team. These changes correct problems in the ARA 1.0 driver found while modifying the code for use in the Newton ROM.

This includes the changes necessary to bring the protocol code more in compliance with the MNP specification. (Two bytes were swapped somewhere in the negotiations. Since both sides of ARA had this characteristic, it worked.... but it wouldn't work with hardware implementations.) The actual protocols are MNP 2, 4, and v.42bis.

The driver consumes about 22K of System Heap, meaning that System 6.0.X users may have to increase their system heap size in order to use the new protocol

support. The driver is always installed the first time the tool is opened. If the driver wasn't installed successfully the user is notified that they will not be able to make an error free connection, but can continue to use the tool without that support.

The tool does not refer to the v.42bis compression or give the user control over it. It is negotiated for if the user requests error correction. A scripting token, "SoftwareCompression" can disable this. Scripting support for error correction was also added.

The tool also supports error correction/compression in the modem. The user (or scripting tokens) may choose among "None", "Optional", and "Required".

The "Required" selection indicates that the connection should fail if the desired type of error-correction could not be obtained. A dialog is provided to indicate that this occurred. ("Hardware" and "None") or ("Software" and ("Optional" or "Required")) mean that the tool additionally sends a modem-specific AT command to disable "hardware" error correction, which is on by default in the modem's initialization command.

If "Hardware" is selected, then the tool looks for the CONNECT message to have an appendage such as "CONNECT 9600/REL". The "9600" has always been used to correct the Mac's serial port speed if necessary, and now the "/REL" is used to indicate that a "Hardware" error correction connection has been established. This string is also modem specific, and multiple strings can be used to indicate the establishment of "Hardware" error correction and when specified, these strings are separated by a bullet character, as in "/REL•/LAPM".

- The user interface (the "Choose" dialog) was significantly changed.

In order to comfortably fit the new error correction controls, a pair of radio buttons and a checkbox were removed.

The checkbox that determined if the tool will use <CR><LF>NO CARRIER<CR><LF> (pause) to detect the other side having hung-up or a dropped connection was removed. The control was deemed unnecessary. The feature is always on unless the "LookForNOCARRIER" scripting token is set to false.

The removed radio buttons were used to select between the user configuring the tool for dialing or answering. This was a common point of user confusion, as these radio buttons didn't actually make this choice for the user. These radio buttons only dimmed out the settings not needed for whichever type of connection the user expected to do. This choice was actually made later when the application calls CMOpen or CMListen, typically controlled by menu selections such as "Open Connection" and "Wait for connection". Their purpose has been superseded by titled gray control groupings, which use less screen real-estate.

Additionally, there used to be an icon that indicated which type of dialing, "Tone", "Pulse", "Mixed", or a ringing phone was active. Since the ringing phone case was not really true, this status icon was removed to make space, and the dialing method pop-up was clarified from "Tone" to "Touch-Tone™".

A static text item containing the short version string was added, and this serves to bring up the about box. The "phone numbers" pop-up is now never hidden. It used to only appear if the user had manually created an "Apple Modem Tool Phone Numbers" file. This item allows the user to select a phone number to dial by name from their personal list.

The pop-up now also contains a "Modify this menu..." item, which brings up the "Add Modify Remove" dialog. This dialog is common to the "Modify this menu..." items in both the "phone numbers" and "modem type" pop-ups. It allows the user to alter the list that appears in the menu the user chose. It features an "Import..." button which provides for merging in of additional items from another file. This is how users will add third-party modem definitions or import phone number databases.

The "custom modem" dialog has been modified to support configuration of error correction features for a modem definition. A button called "Cabling..." was added. This button brings up a dialog containing a picture that describes the cable needed for use with the currently selected modem as well as support information such as the modem manufacturer's phone number. The dialog has a "Save..." button which creates a TeachText read-only ('ttro') file that contains the picture as well as the modem's name. The intent is that this file may be printed and brought to the dealer to ensure that the user obtains the correct cable.

All user items now draw in color when appropriate. All graphics have been replaced with new color ones (except the file icon, which was already color) provided by Bill Woodcock (woody@zocolo.com). Bill generously donated his time and art skills.

- Modem Definitions files contain an updated format 'modm' resource.

This resource describes the modem in terms of its initialization string, preferred baud rate, etc. This resource now contains controlling information about error correction such as the "Hardware error correction has been established" string. This resource additionally may contain a resource ID for a PICT that describes the necessary cable for connecting the modem to a Mac as well as support information, such as the modem manufacturer's phone number.

'modm' resources for all Apple modems (except the "Global Village Teleport/Bronze II for Performa") are contained in the Apple Modem Tool file itself. Additional 'modm' resources may be created by the user via the "Choose" dialog. These resources, and accompanying 'PICT's are renumbered and placed into the "Apple Modem Tool Prefs" file.

The new 'modm' format includes some bits that control support for "direct connect mode". These bits are "undocumented" in that the 'TMPL' for editing 'modm' resources and the developer documentation for the 'modm' format, including the Rez declaration, are listed as "Reserved." "Direct connect mode" turns off all AT command set support. It is provided for use by the "Newton Serial Connection" 'modm', which is used by the Newton Connection Kit and Newton Toolkit.

A 'PICT' resource for the "Newton Serial Connection" is built-in as are 'PICT's

to describe a standard Mini Din-8 to Mini Din-8 cable (M0197) and for a DB-25 to Mini Din-8 cable. The 8-to-8 picture is used for a few of the built-in Apple modems. The 25-to-8 picture is provided for use by third-party modem definitions (particularly those created by power-users and distributed online). Note that these pictures are wrong for a Mac Plus which has a DB-9.

Version Information

1.5.1 - Several bug fixes, most affecting the "Direct Newton Connection" sections of the code. Also, when using CMListen() and require software MNP, an incoming modem connection which established carrier but failed during error correction negotiation would not properly hang up the phone. This was fixed.
1.5.2 - Not distributed.
1.5.3 - CMGetConfig() no longer returns an erroneous token which caused the file "False" to be created on the desktop if this same string was passed in to CMSetConfig(). CMRead() was returning a garbage error value if called async with a non-zero timeout under the right circumstances. It now correctly returns noErr.

Newton 2.0 OS: Won't Write to 1.X Formatted PC Cards (11/95)

Revised: 11/27/95
Security: Everyone

Newton 2.0 OS: Won't Write to 1.X Formatted PC Cards (11/95)

=====

Article Created: 27 November 1995

TOPIC -----

When I insert a Newton PC memory card into my Apple MessagePad 120 with the Newton 2.0 OS, a message appears asking if I want to mount the card as read only, or convert the card. If I convert the card can I still use it in other Newton PDA devices that have the Newton 1.x OS installed?

DISCUSSION -----

No, if you choose to convert a PC card to the Newton 2.0 OS, then you will not be able to read it on a Newton PDA using 1.x of the Newton OS without reformatting the PC card using 1.x of the Newton OS.

If you need to use data on a MessagePad with 2.0 installed, you should select Read Only when the message appears. Selecting Read Only sets a soft write protect on the card, which prevents you from writing to the PC card.

Coach Pro and ClarisWorks 4 Compatibility (4/97)

Revised: 4/28/97
Security: Everyone

Coach Pro and ClarisWorks 4 Compatibility (4/97)

Article Created: 27 November 1995
Article Reviewed/Updated: 17 January 1996

TOPIC -----

I received Spelling Coach Professional (Coach Pro) with the Teacher Productivity Bundle CD-ROM, which is part of the Teach Solution Bundle. However, when I use Coach Pro with ClarisWorks 4, I get the following message, "Coach Pro is having a problem converting the clipboard in this application." Is Coach Pro compatible with ClarisWorks 4?

DISCUSSION -----

Deneba Support has advised that ClarisWorks 4 requires Coach Pro 4.1, which was released in November, 1995. Contact Deneba Software directly for the Spelling Coach Pro 4.1 upgrade, or download a compatibility module form Deneba's support location on America On-Line or CompuServe.

Deneba Support also advises: If you are stuck in a loop with this or a similar message, a way to break out of the loop is to select another piece of text to check, then go back to the original selection and check it again.

PostScript Fonts: Momentary Freeze copying to Server (7/96)

Revised: 7/12/96
Security: Everyone

PostScript Fonts: Momentary "Freeze" copying to Server (7/96)

=====

Article Created: 27 November 1995
Article Reviewed/Updated: 12 July 1996

TOPIC -----

The article discusses an issue with copying numerous PostScript fonts to a file server. When doing this, the file server appears to "freeze" momentarily. However, after a few seconds it works properly.

DISCUSSION -----

The appearance of the file server "freezing" during large PostScript font transfers is caused by Adobe PostScript fonts having a BNDL bit. When a file, whose info bits indicates an icon bundle is present, is copied to a server, the Finder adds this information to the Desktop database. Things that can make this worse are when the Desktop file grows so that the file becomes fragmented on disk, increasing the disk access time to process the file. Rebuilding the Desktop may reduce the size of the desktop database files, but it may still leave the file fragmented. Having a large amount of free space on the disk may help the possibility that the desktop files get a contiguous amount of disk space.

There is not hard and fast rules as to how many PostScript fonts can be copied without experiencing this momentary "freeze". However, some servers may be more prone to this if they have a large hard disk, which allows more files to be stored on them, which leads to a larger desktop file. A hard disk that is nearing capacity, can have a fragmented desktop file, which can increase the time it takes to update the desktop file.

Compressing PostScript fonts with third-party utilities, transferring them to the server, and then decompressing them should speed up the copy across the network. However, this may actually take longer since the files must be decompressed once the file is copied to the server. Also while the files are being restored to their original state, the Finder on the server is placing the icons into the desktop databases.

Third-party copy utilities such as Disktop, CopyDoubler, Desktop Speedboost, or Copyright Pro, which offload the copy operation from the Finder to another task, could potentially decrease the wait, but eventually the Finder on the target server machine has to update the desktop database, so you should not expect much of an improvement, if any, with these utilities.

Since this is the way the Mac OS works, Apple is not doing anything to address this momentary wait. The same phenomenon happens when you drag a number of application files to a server. This would happen to any large number of files that are copied to a file server, which contain BNDL information. The problem may be seen more often with PostScript fonts since these are the type of files typically copied by dragging a large number to a file server.

One other option, which Apple Computer, Inc. does not endorse, is to turn off the bundle bit in the font, to do this you can use ResEdit, or in A/UX you could use setfile.

One thing to remember is that this momentary wait is only experienced once, when the fonts are copied to the server. Compressing the fonts prior to copying them to the file server should speed up the copy process to server since there is less data to copy, and no font icon to update. However, also remember that expanding the PostScript fonts back into their original format after copying them, takes some additional time.

Article Change History:

12 Jul 1996 - Added BNDL bit solution.

Newton OS: NewtonMail Mods 1.0.1 Read Me (4/97)

Revised: 5/1/97
Security: Everyone

Newton OS: NewtonMail Mods 1.0.1 Read Me (4/97)

=====

Article Created: 27 November 1995

TOPIC -----

This article contains the ReadMe file for NewtonMail Mods 1.0.1 update file.

DISCUSSION -----

NewtonMail Users,

Over the last several months, many of you asked us for a number of enhancements to NewtonMail. In order to provide you with an immediate solution to your most frequent requests, we have developed a set of NewtonMail Modules which are enclosed in this folder. These modules give you an immediate upgrade path for NewtonMail which will be supported and integrated within future releases of NewtonMail.

This document gives an overview of the current functionality of these NewtonMail Modules. The modules are an addition to the existing mail software that is built into your Newton ROM. The Newton Connection Kit is required in order to install the modules in this folder.

NEWTONMAIL EXTENSION 1.1 AND FOUR ADDITIONAL MODULES

The new NewtonMail Modules consist of one new extension and four modules. The extension is "NewtonMail Extension 1.1" and the modules are "NewtonMail 1.2", "Group Mail 1.0", "MailMany 1.0", and "Tymnet/MCI 1.1".

The "NewtonMail Extension 1.1" is a base extension required for the new modules. This extension should be installed in the Newton's Internal RAM.

The new enhancement modules (NewtonMail 1.2, Group Mail 1.0, MailMany 1.0, and Tymnet/MCI 1.1) can be installed on the internal RAM or on a PCMCIA card. The modules do not appear in the Extras Drawer, nor will they take up a slot in the Extras Drawer. The modules can be removed via the remove software function. Since each of the optional modules can operate independently, the user has the

flexibility to save space by installing only those modules that are desired.

OVERVIEW OF FUNCTIONALITY:

NewtonMail Extension 1.1 (Size 7.5K)

This extension, which should be installed in the Internal RAM, is required as a base for the additional modules. It may also be installed without any additional modules, in which case it will serve to greatly reduce mail truncation problems and provide a simple "Copy" button to allow the user to copy basic text notes to the NotePad.

Newton Mail 1.2 (Size 16K)

Newton Mail 1.2 provides additional functionality via a new action envelope within the in and out boxes. The following are the main functions that were added:

- Integrates Copy Text to Notes button for documents In/Outbox (including mail header information).
- Allows received items to be easily forwarded.
- Allows mail messages to be readdressed while still in the Outbox.
- Allows mail messages to be printed from the In/Outbox.
- Allows the item's text to be faxed from the In/Outbox.
- Leaves additional space to write in the reply message area.
- Offers automatic save the sender's address to names file feature.

GroupMail 1.0 (Size 16K)

GroupMail adds a "Group Mail" button to the routing slip.

- Enables users to send messages to a set of people in the name card file that have Email addresses.
- Provides selection of multiple names by check boxes.
- Offers automatic creation of mailing lists as Name Card Items.

Mail Many 1.0 (Size 12K)

Mail Many allows users to mail multiple NotePad items.

- Offers a list of all the notes in your NotePad via an additional "Mail Many" option on the NotePad action envelope.
- Provides selection of multiple items by check boxes, beginning with most recently created notes.

Tymnet/MCI 1.1 (Size 12K)

A Newton Connection Kit is required to install the module.

Tymnet/MCI 1.1 is a Mail network script that allows users to connect to NewtonMail via Tymnet/MCI networks.

- Offers Tymnet option as a diamond under Network choices in Mail

Preferences.

- Changes between version 1.0 and 1.1, include a revision to the script to succesfully connect in Europe as well as the US.

Macintosh Performa: How Do I Use the ARA CCL? (11/95)

Revised: 11/27/95
Security: Everyone

Macintosh Performa: How Do I Use the ARA CCL? (11/95)

=====

Article Created: 27 November 1995

TOPIC -----

I have a Macintosh Performa computer. I have an Apple Remote Access (ARA) file called ARA CCL on my hard drive. When I double-click it, I get a message telling me to put it in my Extensions folder. Even if I place it in my Extensions folder and restart, I get the same message. What is Apple Remote Access? How do I use this software?

DISCUSSION -----

Apple Remote Access software provides an easy way to connect a desktop Apple Macintosh or PowerBook computer to another Macintosh computer at a remote location over telephone lines.

Some modem equipped Macintosh Performa computers have an ARA modem script (also known as a CCL file) installed on the hard drive. The file is used to configure your modem to work with the Apple Remote Access software.

Your Performa computer does not include the Apple Remote Access software that uses this CCL file. The file is included on your hard drive so it is available if you decide to purchase ARA. Leaving the file in your System Folder or on your hard drive will not affect the operation of your computer.

You can purchase the Apple Remote Access Client software from your Apple-authorized dealer.

CLW 12/600 PS: Use Printer Pantone Files For Correct Color 10/96

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Use Printer Pantone Files For Correct Color 10/96

Article Created: 28 November 1995
Article Reviewed/Updated: 23 October 1996

TOPIC -----

I'm printing to a Color LaserWriter 12/600 PS from Quark Xpress using Pantone colors. Unfortunately, my printouts DO NOT match some hard copy Pantone swatches that I have. I have printed out the raw PostScript file that came on the "Pantone files for the Color LaserWriter 12/600" disk, and the colors that printed more or less match my Pantone swatches.

Why can I not get my Quark Xpress files to match? Can I change the density settings in the back of my Color LaserWriter 12/600 PS so I get a better match?

DISCUSSION -----

Quark Xpress, like most of the other high-end graphic applications, have their own Pantone color tables you can use. These color selections SHOULD NOT be used when printing to the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printers since they are "tuned" only for monitors. The application-specific files provided on the Pantone disk for the Color LaserWriter 12/600 PS are the correct files to use since they provide Color LaserWriter 12/600 PS-specific CMYK values.

With regard to any changes that can be made in the Color LaserWriter 12/600 PS for color, with the exception of the Density Control Panel at the back of the printer, there are none. We would suggest leaving all of the colors as neutral, unless as the manual says:

"There are always small variations in color between different printers. If you have two Color LaserWriter printers on the same network, you can use the density control panel to make subtle changes to match the two printers."

Article Change History:
23 Oct 1996 - Added Color LaserWriter 12/660 PS to the discussion.

Personal Internet Solution: Description & Specifications 4/97

Revised: 5/1/97
Security: Everyone

Personal Internet Solution: Description & Specifications 4/97

=====

Article Created: 28 November 1995

TOPIC -----

This article describes the Personal Internet Solution Bundle, part of the Apple Education Series.

DISCUSSION -----

The Personal Internet Solution Bundle offered to education customers is intended to provide librarians, administrators, students and individual teachers easy access to the Internet.

Features And Benefits
=====

Feature - Power Macintosh 5200/75 LC or Macintosh LC 580 computer.

Benefit - Apple latest education computers offer expandability, compatibility and high performance including a CD ROM drive.

Feature - Internet software package.

Benefit - Offers some of the most popular Internet applications including Netscape Navigator for Web browsing, Eudora by Qualcomm for electronic mail, and an Internet serial line connection package with custom configuration script.

Feature - Reference CD Collection

Benefit - Four of the best known reference CDs available to bring the world of information into the classroom. Allows users to begin research locally and then venture out into the Internet for additional data and insight.

Feature - Global Village 14.4 external Data and Fax Modem

Benefit - Without additional modem purchase, allows connection to Internet and online services. Allows faxing from the computer.

Feature - Getting Started Guide

Benefit - Give users an easy-to-follow and complete guide to setup of the bundle.

Feature - Portal Information Network Internet provider connection.

Benefit - Up to \$75 connect time credit, no setup fee, and up to three monthly maintenance fees waived from this popular Internet access provider with more than 1100 local access numbers servicing up to 95% of the US.

Feature - Discount coupons for educational reference materials.

Benefit - Savings on even more relevant resources.

Bundled Items

=====

The AES Personal Internet Solution Bundles include the following software and miscellaneous items:

- Personal Internet Solution CD
 - Netscape Navigator by Netscape Communications 1-800-NET-SITE (638-7483)
 - Eudora by Qualcomm 1-800-2-EUDORA (383672)
 - InterSlip by Intercon

Reference CD Collection

- 3D Atlas by Electronic Arts 1-415-572-2787
- Grolier Multimedia Encyclopedia by Mindscape 1-415-883-5157
- INFOPEDIA by Future Vision Multimedia 1-914-426-0400 ext. 4
- Time Almanac: Reference Edition by Compact Publishing 1-404-428-0008

Other

- Global Village 14.4 Data and Fax Modem 1-415-390-8200
- Getting Started Guide
- Portal Information Network 1-408-973-9111
- Other coupons
 - 20% discount coupon National School Board Association special report "Telecommunications and Education: Surfing and the Art of Change."
 - 25% discount coupon toward the book "Education on the Internet."
 - Free 3-month subscription to "Classroom CONNECT," a monthly guide to the Internet.

System Requirements

- System software 7.1 or later
- Macintosh with a 68030 processor or later*
- At least 8MB of RAM
- CD-ROM drive
- 13" monitor or larger

* The Personal Internet Solution Bundle is not compatible with the Power Macintosh 7200, 7500, 8500 or 9500 computers.

Ordering Information

=====

Part No. Description

B2424LL/D Macintosh LC 580 Personal Internet Solution Bundle

- Includes Macintosh LC 580 8MB Hard Disk 800 w/CD-ROM CPU and AppleDesign Keyboard (M3964LL/B) and Personal Internet Solution Accessory Kit

B2423LL/F Power Macintosh 5200/75 LC Personal Internet Solution Bundle

- Includes PowerMacintosh 5200/75 LC 8MB Hard Disk 800 w/CD-ROM CPU AppleDesign Keyboard (M3947LL/C) and Personal Internet Solution Accessory Kit

T1646LL/C Personal Internet Standalone Solution

- Supports Macintosh with 030 processor or better**, 8MB RAM and CD-ROM Drive

** The Personal Internet Solution Bundle is not compatible with the Power Macintosh 7200, 7500, 8500 or 9500 computers.

Power Macintosh: Startup Failure Tone (11/95)

=====

Article Created: 29 November 1995

TOPIC -----

Whenever I attempt to start up my Power Macintosh computer, the computer plays a "car crash" sound. What is causing this?

DISCUSSION -----

The "car crash" sound is the startup failure tone on the Power Macintosh series computers. Such a failure could be caused by either software or hardware problems. To troubleshoot this error tone, see the Tech Info Library article, "System 7.x: Troubleshooting Startup Problems".

PowerBook & PowerBook Accessories:Serial Number Locations(11/95)

Revised: 11/29/95
Security: Everyone

PowerBook & PowerBook Accessories:Serial Number Locations(11/95)

=====

Article Created: 29 November 1995

TOPIC -----

This article describes where serial numbers are located on various PowerBook computers and PowerBook accessories. The serial number is printed underneath a barcoded number and is normally 10 or 11 digits.

DISCUSSION -----

On the Back of the Computer Under the Ports

The serial numbers for the following PowerBook computers are located on the back of the unit where the ports are found. There is a small I/O door on the back that must be opened in order to gain access to this area of the computer.

- Most PowerBook 100 Series (140, 145, 145b, 160, 165c, 170, 180, 180c)
- PowerBook 500 Series

On the Bottom of the Computer

The serial numbers for the following PowerBooks are located on the bottom of the unit in the center.

- PowerBook 100, 150
- PowerBook Duo Series (210, 230, 250, 270c, 280, 280c, 2300c)*
- PowerBook 190 Series (190, 190cs)
- PowerBook 5300 Series (5300/100, 5300cs/100, 5300c/100, 5300ce/117)

Other Serial Number Locations

Other Portable units and accessories:

- Macintosh Portable: Orient the Macintosh Portable computer so it is standing vertically on its back (where the ports are located). The serial number is on the bottom of the machine, in the upper right corner.
- Mini Dock, Duo Floppy Drive, Battery charger, Duo Floppy Adapter: The serial number is located on the bottom in the center.
- Duo Dock, Duo Dock II, Duo Dock Plus: The serial number is located on the back (where the ports are located) in the center.

* Note: the serial numbers for PowerBook 200 series computers (Duos) are not visible while they are attached to a docking device or accessory.

A/UX or AWS 95: Copy Complete Contents Of A Partition (11/95)

Revised: 11/29/95
Security: Everyone

A/UX or AWS 95: Copy Complete Contents Of A Partition (11/95)

=====

Article Created: 29 November 1995

TOPIC -----

I'm trying to copy the UNIX drive from my Apple Workgroup Server (AWS) 95 to another UNIX drive, in the same computer. How do I do this?

DISCUSSION -----

NOTE:

This is a long response, please read it in its entirety before attempting to follow the steps outlined below.

CAUTION:

There are steps in this procedure that will destroy the data on a disk. Please make sure the disk is backed up, and the correct parameters are used because loosing data in this fashion would be non-recoverable.

We do not have a clear understanding of what, "copying the UNIX drive," means. We will assume you are trying to move the data from your AWS 95 root disk to a second hard disk, in other words, creating a copy of the AWS 95 A/UX partition. If this is not correct, the procedure below should work for any partition you want to copy, that is, you could us the same process to copy other A/UX partitions.

Example and Procedure

The internal drive, to be copied, is connected to the PDS card with its SCSI address set to 0. Since the root volume is assigned Slice 0, the device name to access this drive would be /dev/dsk/c300d0s0.

The target drive is connected to the external port of the PDS card with its SCSI ID set to 5. Since we are trying to copy the root file system, it should have a partition with Slice 0 assigned to it. The device name to access this drive would be /dev/dsk/c405d0s0.

Also, be certain the partition of the target drive is large enough to contain all of the data in the source partition.

When we refer to using a command, we mean typing the command in a CommandShell window.

Make sure AppleShare Pro is not running.

Step 1

Since we are going to copy ONLY the contents of the root partition, make sure you unmount all other partitions, you can use the command:

```
umount -a
```

Step 2

Run Apple HDSC Setup WHILE IN A/UX -- this is important. If this step is done while in the Mac OS, the disk will be partitioned but the UNIX partitions will not contain a file system. Below are three ways for creating UNIX partitions -- the first is recommended:

- If you use the Apple HDSC Setup program while in A/UX, the program will ask you for a mount point for the file system being created. Since we are assuming you are copying the root drive and volume, mount the drive on a directory called "/s0".
- If the disk was formatted and partitioned while in the Mac OS, a file system can be created on the UNIX partitions with the command:

```
newfs /dev/dsk/cX0Yd0sZ  (## This erases all data in the partition ##)
```

Where X = SCSI BUS (1, 2, 3 or 4)

Y = SCSI ID of the drive (0, 1, 2, 3, 4, 5 or 6)

Z = Slice where the file system will be created (0 for root volume)

The value for Z is chosen when partitioning the drive and creating a UNIX partition.

- If Apple HDSC Setup will not be used, create a directory called /s0 and mount the partition using the commands:

```
mkdir /s0
```

```
mount /dev/dsk/c405d0s0 /s0
```

Step 3

Copy the data to the target drive. The following commands will copy the contents of the complete file system preserving access privileges, access times and modification dates:

```
cd /  
find . -print | grep -v /s0 | cpio -pdlmuv /s0
```

Step 4

Unmount the target partition and run fsck on it with the following commands:

```
umount /s0  
fsck /dev/dsk/c405d0s0
```

The target drive now contains a copy of the source drive's file system.

If you are planning on using this drive as a complete replacement for the internal drive, special care should be taken that the drive contains the following partitions:

- A Macintosh Volume that contains a copy of the contents of the MacPartition
- A Swap partition that is at least the same size as the amount of RAM in the AWS 95.

AplShare Windows Client: Unsupported Network Adapters (11/95)

Revised: 11/29/95
Security: Everyone

AplShare Windows Client: Unsupported Network Adapters (11/95)

=====

Article Created: 29 November 1995

TOPIC -----

This article explains how to install the AppleShare Client for Windows if it does not come with the driver for your particular network adapter.

DISCUSSION -----

Windows for Workgroups 3.11 and Unsupported Network Adapters

If you are using Windows for Workgroups 3.11, use your Windows for Workgroups installation disks to install your network adapter. Once the network adapter is working in Windows, you can install the AppleShare Client for Windows software using the normal installation procedures.

Windows 3.1 and 3.11 and Unsupported Network Adapters

If you are using Windows 3.11 or Windows 3.1 without Windows networking software, and you have a vendor supplied ODI driver for an unsupported network adapter, you may be able to use the procedures in this section to install AppleShare Client for Windows.

CAUTION:

Installing your system for networking requires that you manually install the network adapter driver and edit your driver configuration file and your DOS startup batch files. Performing these procedures incorrectly can cause your computer to fail.

Before performing the following procedures, you should locate the software and documentation that came with your network adapter. As you perform the procedures, you will need information from the documentation.

Step 1

If your network adapter is not already installed, install and test it, following the instructions in your network adapter documentation.

Step 2

Restart your computer and run Windows.

Step 3

Run the INSTALL.EXE program on the AppleShare Client for Windows Disk 1.

Step 4

In the Installation Options dialog box, choose the Standard Installation option and click Continue.

The Select Adapter dialog box appears.

Step 5

Select the line at the end of the adapter list that reads "[Other] Unlisted Adapter Option," and click OK.

The Network Adapter Settings dialog box appears.

Step 6

Enter the configuration settings for your network adapter.

If possible, select values that match the adapter configuration settings you used in completing step 1 above. If no matching settings are displayed, simply continue with step 7. If you are already running ODE-based networking software, AppleShare Client for Windows Installer will use your existing network adapter configuration settings.

Step 7

Complete the AppleShare Client for Windows installation.

Step 8

Exit Windows and restart your computer as instructed by the Installer.

If your computer was not already running ODE-based networking software, continue with step 11.

Step 9

If your computer was already running ODE-based networking software using your network adapter card, edit the file ATDRIVER.BAT (by default in the C:\APPLE\A_SHARE directory). Remove the word "REM" from the beginning of the last line so that it reads "C:\APPLE\A_SHARE\ODI.EXE".

Step 10

Restart your computer.

AppleShare Client for Windows is completely installed and should run when you start Windows. Skip the rest of this procedure.

Step 11

Use DOS to copy the ODI driver and any supporting files for your network adapter to your AppleShare Client for Windows directory. The default directory path is C:\APPLE\A_SHARE.

Step 12

Edit the NET.CFG file in the C:\APPLE\A_SHARE directory.

First, replace all strings of four consecutive X characters (that is, XXXX) with the file name of your driver, excluding the .COM extension for the file.

Next, change any parameters that do not match your adapter configuration settings. Check the values for the following parameters:

- the interrupt request level, a one- or two-digit number preceded by INT #1
- the I/O port number, a 3-digit value such as 300, preceded by PORT #1
- the direct memory access channel, a value of 1 or 2 preceded by DMA
- the memory access address, a data address value such as D8000, preceded by MEM

You should consult your network adapter card documentation to determine if other parameters are required for your system.

Finally, save the NET.CFG file.

Step 13

Edit the file ATDRIVER.BAT (by default in the C:\APPLE\A_SHARE directory).

First, remove the word "REM" from the beginning of every line. Next, replace the string "XXXX" in the second line of the file with the filename of your network adapter driver. Be sure to include the filename extension.

Step 14

Save the ATDRIVER.BAT file.

Step 15

Restart your computer by turning it off and on.

AppleShare Client for Windows is completely installed and should run when you start Windows.

If you experience any problems after completing these instructions, see the file C:\APPLE\A_SHARE\PROBLEMS.WRI.

LaserWriter 16/600 PS: Supports HPGL/2 Through PCL5 (11/95)

Revised: 11/29/95
Security: Everyone

LaserWriter 16/600 PS: Supports HPGL/2 Through PCL5 (11/95)

Article Created: 28 November 1995

TOPIC -----

We have a Power Macintosh 6100/66 DOS Compatible Macintosh and are trying to print to a LaserWriter 16/600 PS. The application we are using is DOS-based, and outputs HPGL. I've heard that the LaserWriter 16/600 PS printer supports HPGL/2, but I'm unable to get any output when I send HPGL to the printer. What's wrong? Also, is HPGL/2 backward compatible with the original HPGL language?

DISCUSSION -----

The LaserWriter 16/600 PS does support the HPGL printing language. This Support for HPGL is provided though the PCL5 emulation, which inherently has HPGL/2 support. Tests on our LaserWriter 16/600 PS using HPGL/2 were successfully. Your problem is likely with the initial escape sequences used by the MS-DOS-based program to set the printer into HPGL/2 mode, or in the HPGL/2 drawing commands themselves.

The problem you are seeing is not related to the DOS Compatibility Card or the LaserWriter 16/600 PS printer since:

- Print jobs from the MS-DOS environment are sent without modification of the output. All of the output data is sent directly to the printer.
- HPGL/2 data we downloaded to the LaserWriter 16/600 PS prints without problem.

Depending on which input port, and mode it is set to: PCL, or PostScript, of the LaserWriter 16/600 PS you are using, you may need to send a line of PostScript code to the printer prior to all HPGL/2 and PCL5 print jobs. The following command places the PostScript interpreter into PCL5 mode:

```
%=====
% Begin PostScript code
%
```

```
currentfile /LaserJetIII statusdict /emulate get exec
%
% End PostScript code
%=====
```

Once the printer is placed into the PCL5 emulation, you need to use the following escape sequence to place the printer into the HPGL/2 mode:

To go from PCL5 to HPGL/2: <esc>%#B

To return from PCL5 from HPGL/2: <esc>%#A

HPGL/2 Compatibility

=====

Regarding the question about backward compatibility of HPGL/2 with the original HPGL language, we contacted Hewlett-Packard technical support and they cited only the following differences:

MISSING HPGL/2 COMMANDS

The HP LaserJet III, IIID, 4, 4Si, 4L, and 4P printers do not have every command that is available in HPGL or HPGL/2. The following is a list of some of the known commands that are not available with the printers mentioned.

- XT and YT (X-Tick and Y-Tick)

This command allows plotters to automatically print an x and y axis on printed plots. This command is a HPGL command and is not found in HPGL/2.

- RP (Replot)

This command allows a plotter to automatically recreate a plot without having to send new data to the plotter. When using the HP LaserJet III and 4, family printers, the only method of obtaining multiple plots is to send the copy command before entering HPGL/2 followed by the exit HPGL/2 command at the end of the file.

- PG (Page Advance)

This command tells the plotter to eject a plot. This was disabled on the HP LaserJet III and 4 printers so PCL and HPGL/2 could be mixed on the same page without any page eject problems.

AppleShare, Alias Manager Issue Fixed (4/96)

Revised: 4/3/96
Security: Everyone

AppleShare, Alias Manager Issue Fixed (4/96)

Article Created: 29 November 1995
Article Reviewed/Updated: 3 April 1996

TOPIC -----

This article describes an AppleShare and Alias Manager issue, and how it has been fixed with System 7.5.3 and AppleShare Workstation 3.6.2.

DISCUSSION -----

Summary of the Issue

The first issue was with the Alias Manager returning the wrong error message when a client tried to connect to an AFP server with an expired password. Instead of receiving the message to the effect "Your password has expired. Please enter a new one," the user received the message "The volume <name> could not be found on the network." The proper message appeared when connecting through the AppleShare Chooser, PowerTalk Catalog, or KeyChain, but not with the Alias Manager.

The second issue was if the user received the correct error message, there was no option for changing the password from the login panel from both the Alias Manager and PowerTalk. Logging in from the Chooser presents the user with a "Set Password" option.

The Fix in Two Parts

PART 1

System 7.5.3 (installed with System 7.5 Update 2.0) includes code changes to present the correct error message from both the Alias Manager and the PowerTalk Catalog or KeyChain. This solves the first issue above. System 7.5.3 also includes code to enable the fix in PART 2 below. System 7.5 Update 2.0 is available as a free upgrade for any 68030-based or later Macintosh computer running System 7.5 or later.

PART 2

AppleShare 4.2.1 includes a new version of the AppleShare Workstation, version 3.6.2, that presents a user with the "Set Password" option from the Chooser, the Alias Manager Login Window, and the PowerTalk Catalog or KeyChain Login Window. This fix requires the code changes in System 7.5.3 mentioned above. AppleShare Workstation 3.6.2 is compatible with earlier versions of the Mac OS, but will not fix the password expiration issue unless it is used in conjunction with System 7.5.3.

IMPORTANT NOTE:

Because System 7.5.3 and System 7.5 Update 2.0 were completed before AppleShare 4.2.1 was completed, AppleShare Workstation 3.6.2 is not part of System 7.5.3 (AppleShare Workstation 3.6.1 is in System 7.5.3). AppleShare Workstation 3.6.2 is distributed with AppleShare 4.2.1 and will also be posted to various online services and the Internet.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

03 Apr 1996 - Change distribution and updated article.

PowerBook 500 Series: Frequently Asked Questions (5/96)

Revised: 10/14/96
Security: Everyone

PowerBook 500 Series: Frequently Asked Questions (5/96)

=====

Article Created: 29 November 1995
Article Reviewed/Updated: 9 May 1996

TOPIC -----

This document contains the answers to the following frequently asked questions (FAQ) about PowerBook 500 series computers.

- 1) I recently purchased a new battery for my 500 series PowerBook. My PowerBook isn't charging/recognizing this battery. What should I do?
- 2) My PowerBook does not always eject floppy disks, what's the problem?
- 3) My PowerBook display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?
- 4) My external monitor is not displaying an image when I start up my PowerBook.
- 5) I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen.
- 6) I'm trying to connect my PowerBook as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.
- 7) Sometimes I can't seem to use my internal modem and print at the same time. Why is this?
- 8) Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?
- 9) Sometimes when I try to use the Trackpad, the cursor jumps around uncontrollably. What causes this?
- 10) Will my RAM and internal modem still be compatible after I upgrade my PowerBook 500 series computer to the PowerPC 603e processor?

11) I want to use an external modem with my PowerBook 500 series. According to the manual that came with my PowerBook, I need to check Normal in my PowerBook Setup control panel. I open the control panel, and the setting is not there. What's wrong?

12) I have a PowerBook 500 series with a Global Village PowerPort Mercury modem. Can you tell me how to send and receive faxes?

13) I've hooked up an external CD-ROM drive to my PowerBook 500 series and I'm playing an audio CD. When I bring up the AppleCD Audio Player I can see the numbers moving but there is no sound coming through the speakers, although I can hear the sound of regular multimedia CD's fine. Can I play an Audio CD through the internal speakers?

14) Will the Apple PlainTalk microphone work with the PowerBook 500 series?

15) How can I use an external microphone?

16) I am trying to record a sample of an audio CD with the Sound control panel. The sound comes out non-existent or weak. The CD player is running through the audio input port on the back of the computer. What's the problem?

17) Where else can I go for answers?

DISCUSSION -----

1) Question: I recently purchased a new battery for my 500 series PowerBook. My PowerBook isn't charging/recognizing this battery. What should I do?

Answer: Try running the Intelligent Battery Update on your battery. This will update and fix the battery if needed, or let you know that the battery needs to be replaced. The Intelligent Battery Update can be found at the path
US -> Macintosh -> Powerbook -> Other PB SW.

If the Intelligent Battery Update does not alleviate the symptoms, try resetting the power manager on the PowerBook by following these steps:

Step 1

Shut down the PowerBook using the Special menu.

Step 2

Press the Command-Option-Control-Power On keys simultaneously and let go. Pressing the keys will not appear to do anything.

Step 3

Press the Power On key to start up the PowerBook. Your brightness and contrast settings may be reset and you may need to adjust them in order to see the screen.

If the symptom is still not resolved, the battery may need replacement. You can contact the Apple Assistance Center at 800-SOS-APPL (800-767-2775) or contact the Apple Referral Center at 800-538-9696 to

2) Question: My PowerBook does not always eject floppy disks, what's the problem?

Answer: The drive may not be properly aligned. If you can see the metal frame sticking up more than a couple of centimeters behind the floppy drive door, you should contact the Apple Assistance Center at 800-SOS-APPL (800-767-2775) to arrange for repair at our repair center or contact the Apple Referral Center at 800-538-9696 to obtain a phone number for an Apple-authorized service provider in your area.

3) Question: My PowerBook display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?

Answer: The technology used on the passive-matrix displays is susceptible to shadowing and ghosting, since it does not individually address each pixel on the display. Gray-scale passive-matrix displays are particularly susceptible to the symptoms. The PowerBook 100, 140, 145, 145B, 150, 160, 165, 210, 230, 520, 190, and 5300/100 all use a gray-scale passive-matrix display.

Some suggestions to reduce the effects of the shadowing:

- * Adjust the brightness and contrast settings of the display. Usually a lighter contrast setting will look better.

- * Use a darker desktop pattern. The effects of the shadowing will not be as apparent with the darker background.

- * Open the Monitors control panel and select "Black & White" instead of 16 Shades of Gray.

Although these tips can help mitigate the effects of the shadowing, some amount of screen anomalies will always be present on gray-scale passive-matrix displays.

4) Question: My external monitor is not displaying an image when I start up my PowerBook.

Answer: Follow this procedure:

Step 1

Shut down the PowerBook.

Step 2

Make sure the video cable connected to both the PowerBook video port and the

Monitor video port is secure.

Step 3

Make sure the PowerBook is plugged into the AC adapter, which is required to use an external monitor.

Step 4

Start up the PowerBook and open the Monitors control panel. You should see images of two monitors, representing the PowerBook display and the external monitor. If you don't see the image of the external monitor, repeat steps 1 and 2.

Step 5

In the Monitors control panel, click (and hold) the "Identify" button. A large 2 should be displayed on the external monitor icon.*

*Tip: If you wish to use the external monitor as your primary monitor, open the Monitors control panel and drag the menu bar from the top of the internal display (labeled 1) to the top of the external monitor (labeled 2).

5) Question: I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen.

Answer: You are most likely using the wrong SCSI cable. You should be using the HDI-30 SCSI System Cable (M2538LL/A), which is a light gray color and only has 29 pins (there is a pin missing). You are most likely using the HDI-30 SCSI Disk Adapter cable (M2539LL/A) which is dark gray and has all 30 pins.

6) Question: I'm trying to connect my PowerBook as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.

Answer: You may have the wrong cable. Use the Apple HDI-30 SCSI disk adapter cable, part number M2539LL/A, in conjunction with an Apple SCSI System Cable appropriate to your other Macintosh along with proper SCSI termination.

7) Question: Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook models that have only one serial port (200's, 2300's, 190's, 5300's), the serial port is mapped as a modem port. Under normal conditions this isn't a problem - the internal modem can be used at the same time as a serial device such as a printer is being used.

The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control

panel to Internal, Compatible, or "Use internal modem instead of modem port".

The location of this setting will depend on what version of the modem and system software you have. When the PowerBook is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there's an update.

8) Question: Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

Answer: As discussed in the previous question, a PowerBook with a single serial port (200's, 2300's, 190's, 5300's) introduces some variables to serial printing. Three things must be true to print to a serial printer with a single serial port PowerBook:

Step 1

AppleTalk must be set to inactive in the Chooser or something other than LocalTalk must be selected in the Network control panel.

Step 2

If you have an internal modem you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to External, Normal, or uncheck "Use internal modem instead of modem port" (see above). The location of this setting will depend on what version of the modem and system software you have.

Step 3

When selecting the serial printer in the Chooser, you must select the modem port or the combined printer/modem port. Do not select the printer port.

9) Question: Sometimes when I try to use the Trackpad, the cursor jumps around uncontrollably. What causes this?

Answer: The Trackpad works on a principal called coupling capacitance. As your finger moves over the surface, the Trackpad evaluates the change in capacitance between two layers of measurement electrodes built into the surface of the Trackpad.

The most common cause of a jumping Trackpad cursor is moisture interference. If you have sweaty hands or if moisture collects on the pad, this may confuse the Trackpad. Wiping off the Trackpad with a cloth or tissue will usually fix this problem. If you find that it continues to get wet you may want to consider purchasing a teflon or mylar pad to fit over the pad to prevent the moisture from having direct contact with the pad. Before installing the pad, make sure the Trackpad is clean. You can use a mild glass cleaner sprayed onto the cloth, not onto the Trackpad itself.

Make sure only one part of your finger is touching the pad. You will not be able to use a pen or other object, it is designed to work with your finger. Also make sure that you are not resting your wrist on or very close to the pad. The Trackpad may interpret this as your wrist touching it and make the cursor move in that direction. If you suspect either of these is causing the cursor's behavior, try raising your wrist in the air and only touch the pad with the tip of your finger. If the symptom goes away then you know that one of the above is the cause and you should adjust the position of your wrist and or finger.

Oil or lotion can cause the same problem. Either do not use hand lotion, or consider purchasing a teflon or mylar pad to protect the pad. Before installing the teflon pad, make sure the Trackpad is clean.

Jewelry may also cause interference. Try removing rings or bracelets and see if the jumping or erratic behavior disappears.

10) Question: Will my RAM and internal modem still be compatible after I upgrade my PowerBook 500 series computer to the PowerPC 603e processor?

Answer: The existing RAM card and internal modem should be compatible with the PowerPC 603e upgrade. All Apple products are.

11) Question: I want to use an external modem with my PowerBook 500 series. According to the manual that came with my PowerBook, I need to check Normal in my PowerBook Setup control panel. I open the control panel, and the setting is not there. What's wrong?

Answer: If you do not have an internal modem, this setting will not appear in the PowerBook Setup control panel. If you want to use an external modem with your PowerBook 500 series, simply make certain AppleTalk is inactive in the Chooser and select the modem port in your communications software. You can leave AppleTalk active if you select something other than LocalTalk in the Network control panel.

12) Question: I have a PowerBook 500 series with a Global Village PowerPort Mercury modem. Can you tell me how to send and receive faxes?

Answer: Instructions for sending a fax are detailed on pp. 77-89 of your PowerPort 500 Series User's Guide.

Sending a fax is a lot like printing. You can follow these instructions to send your first fax:

Step 1

Open whatever document you would like to fax. You could fax from within the application SimpleText, for example.

Step 2

Hold down the Option key on your keyboard, and choose the command Fax from your File menu.

Step 3

The Send Fax Setup dialog box will appear. Here you can enter your Station Name and Station Fax Number. Click OK when you are done.

Step 4

The GlobalFax dialog will appear. Enter the number you wish to call in the Fax field, and enter the recipient's name in the To field. You can also choose a cover sheet at this window.

Step 5

Once you've entered the fax number and name of the recipient, click the Send... button. Your software should image and fax the document.

Instructions for receiving a fax are detailed on pp. 99-105 of your PowerPort 500 Series User's Guide.

You can configure your PowerBook to receive faxes automatically. Of course, it will have to be connected to an analog phone line. To set your PowerBook up to receive faxes automatically, follow these steps:

Step 1

Open the "Global Village Fax Center" under the Apple menu.

Step 2

Under the Fax menu, choose Setup and Receiving.

Step 3

In the Receive Fax Setup dialog box, put an X next to Receive Fax... Click OK when done.

After this, the Global Village Fax Center will answer incoming calls to receive faxes.

13) Question: I've hooked up an external CD-ROM drive to my PowerBook 500 series and I'm playing an audio CD. When I bring up the AppleCD Audio Player I can see the numbers moving but there is no sound coming through the speakers, although I can hear the sound of regular multimedia CD's fine. Can I play an Audio CD through the internal speakers?

Answer: There is not a direct connection between the SCSI port and the speakers,

so direct play-through of audio CD's is not readily possible. Typically, only Macintosh computers which have an internal CD-ROM drive can play-through audio CD sound to the internal speakers. You will need to connect external speakers to the external CD-ROM drive to hear the audio CD sound.

14) Question: Will the Apple PlainTalk microphone work with the PowerBook 500 series?

Answer: No, the PlainTalk microphone is only supported with most Power Macintosh computers and the Quadra 840AV and 660AV.

15) Question: How can I use an external microphone?

Answer: The audio input port on the PowerBook 500 series computer is a line-level input. This means that it requires an audio signal with a strength of at least 1 volt peak-to-peak. If you want to use an external microphone, you will need to run it through a stereo system or a pre-amp that outputs a line-level signal, and you must be using a program capable of using this type of signal (see the next question).

16) Question: I am trying to record a sample of an audio CD with the Sound control panel. The sound comes out non-existent or weak. The CD player is running through the audio input port on the back of the computer. What's the problem?

Answer: The PowerBook 500 series uses an audio input port that requires a line-level signal, which your CD player is most likely providing. The problem is that the Sound control panel does not read this type of signal, and will not record it correctly. The Sound control panel is only designed to record sounds from the internal microphone on the PowerBook 500 series computers. To record sound from any device running through the external audio input on a PowerBook 500 series computer, you will need to use an application program such as Opcode Audio Shop that has an "auto-gain" option or some similar feature.

17) Question: Where else can I go for answers?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Technical Information Library (TIL). This library contains thousands of technical articles which are easily searchable using boolean search strings.

Security: Everyone

PowerBook 100 Series: Frequently Asked Questions (11/95)

=====

Article Created: 29 November 1995

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about PowerBook 100 series computers.

Questions Answered in This FAQ:
=====

1) When I press the power button, my PowerBook does not start up, or flashes the display momentarily. What is wrong?

2) Since I installed a modem on my PowerBook 150, the battery seems to get depleted very quickly. What can I do to save battery power?

3) My PowerBook does not always eject floppy disks, what's the problem?

4) My PowerBook display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?

5) I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen. Why is this?

6) I'm trying to connect my PowerBook as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number. What's wrong?

7) My battery lasts only a very short time. What can I do?

8) When starting up, my PowerBook with Express Modem displays the Fax Modem extension icon with an "X" through it. I can't use my modem to send a fax. What's wrong?

9) My external monitor is not displaying an image when I start up my PowerBook.

10) Do PowerBook 190 computers support external video?

11) Why does my PowerBook trackball sometimes appear to "stick" or "jump" when rolled?

12) How do I back up the files on my PowerBook 145B or 150?

13) I made a backup of the information on my PowerBook 145B/150 hard drive. Now I would like to restore just one of my control panels. Can I restore a single file from the backup?

14) I did not make a backup of the system software on my PowerBook 145B (or PowerBook 150), and now I think I need to reload the operating system. I do not want to upgrade to System 7.5. Where can I get a new copy of the software that came with my PowerBook?

15) I am upgrading my PowerBook with Express Modem to System 7.5. What version of the Express Modem software should I be using?

16) Can the PowerBook 5300/190 use two batteries simultaneously?

17) Where else can I go for answers?

DISCUSSION -----

1) Question: When I press the power button, my PowerBook does not start up, or flashes the display momentarily. What is wrong?

Answer: First try plugging in the AC Adapter. If the computer starts with the AC Adapter, but not with the battery in the battery compartment, you either need to charge the battery, or you may need to replace the battery.

If that doesn't help, try resetting the power management circuitry. Please see the document titled "PowerBook Power/Batteries: Frequently Asked Questions" for instructions on resetting the power manager.

2) Question: Since I installed a modem on my PowerBook 150, the battery seems to get depleted very quickly. What can I do to save battery power?

Answer: Apple released the PowerBook 150 Update to correct this problem. When the PowerBook 150 has an internal modem, the modem continues to draw power when not in use. This shortens the battery life. The update is available at the path U.S.A. Apple Software Updates -> Macintosh -> System Software -> Other System Software. The update is not required with system software version 7.5 or later.

3) Question: My PowerBook does not always eject floppy disks, what's the problem?

Answer: The drive may not be properly aligned. If you can see the metal frame

sticking up more than a couple of centimeters behind the floppy drive door, you should contact the Apple Assistance Center at 800-SOS-APPL (800-767-2775) to arrange for repair at our repair center or contact the Apple Referral Center at 800-538-9696 to obtain a phone number for an Apple-authorized service provider in your area.

4) Question: My PowerBook display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?

Answer: The technology used on the passive-matrix displays is susceptible to shadowing and ghosting, since it does not individually address each pixel on the display. Gray-scale passive-matrix displays are particularly susceptible to these symptoms. The PowerBook 100, 140, 145, 145B, 150, 160, 165, 210, 230, 520, 190, and 5300/100 all use a gray-scale passive-matrix display.

Some suggestions to reduce the effects of the shadowing:

- * Adjust the brightness and contrast settings of the display. Usually a lighter contrast setting will look better.

- * Use a darker desktop pattern. The effects of the shadowing will not be as apparent with the darker background.

- * Open the Monitors control panel and select "Black & White" instead of 16 Shades of Gray.

Although these tips can help mitigate the effects of the shadowing, some amount of screen anomalies will always be present on gray-scale passive-matrix displays.

5) Question: I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen. Why is this?

Answer: You are most likely using the wrong SCSI cable. You should be using the HDI-30 SCSI System Cable (M2538LL/A), which is a light gray color and only has 29 pins (there is a pin missing). You are most likely using the HDI-30 SCSI Disk Adapter cable (M2539LL/A) which is dark gray and has all 30 pins.

6) Question: I'm trying to connect my PowerBook as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number. What's wrong?

Answer: You may have the wrong cable. Use the Apple HDI-30 SCSI disk adapter cable, part number M2539LL/A, in conjunction with an Apple SCSI System Cable appropriate to your other Macintosh along with proper SCSI termination.

NOTE: SCSI Disk Mode is NOT supported on the following PowerBook models: 140, 145, 145B, 150, and 170.

7) Question: My battery lasts only a very short time. What can I do?

Answer: Follow the procedure detailed below.

Step 1

Reset the power manager, following the procedure detailed in the document titled "PowerBook Power/Batteries: Frequently Asked Questions".

Step 2

Let the battery charge for 8 hours. This procedure should resolve the problem.

Step 3

A few words about ongoing battery care: Completely discharge the battery after approximately 15 to 20 recharges. Here's how to do this:

Let the battery discharge completely until the PowerBook goes into sleep mode. You'll see three battery warning dialog boxes before this occurs. This process will "recycle" the nickel cadmium (NiCad) battery and eliminate a "memory effect," which makes the battery appear depleted when it is not.

Note: Do not attempt to fully discharge or recondition a PowerBook 100 lead-acid battery. If the battery life has significantly diminished on a lead-acid battery, then it probably needs to be replaced.

8) Question: When starting up, my PowerBook with Express Modem displays the Fax Modem extension icon with an "X" through it. I can't use my modem to send a fax. What's wrong?

Answer: Open the Preferences folder inside your System Folder and trash the Fax Preferences file, empty the Trash, and restart your PowerBook. The Fax Preferences file can be corrupted due to a system error or screen freeze, disabling the Fax Modem extension as a result.

9) Question: My external monitor is not displaying an image when I start up my PowerBook.

Answer: Follow this procedure:

Step 1

Shut down the PowerBook.

Step 2

Make sure the video cable connected to both the PowerBook video port and the Monitor video port is secure.

Step 3

Make sure the PowerBook is plugged into the AC Adapter, which is required to use an external monitor.

Step 4

Start up the PowerBook and open the Monitors control panel. You should see images of two monitors, representing the PowerBook display and the external monitor. If you don't see the image of the external monitor, repeat steps 1 and 2.

Step 5

In the Monitors control panel, click (and hold) the "Identify" button. A large 2 should be displayed on the external monitor icon.

Tip: If you wish to use the external monitor as your primary monitor, open the Monitors control panel and drag the menu bar from the top of the internal display (labeled 1) to the top of the external monitor (labeled 2).

10) Question: Do PowerBook 190 computers support external video?

Answer: External video on the PowerBook 190 computers is optional. The PowerBook 190 implements a PDS slot in the rear of the computer that can be filled with an Apple or third-party video card. Apple's video card, model number M3743LL/A, provides 8-bit color at resolutions up to 832x624 using 512k VRAM.

11) Question: Why does my PowerBook trackball sometimes appear to "stick" or "jump" when rolled?

Answer: Most PowerBook trackball problems are due to contamination of the rollers. The trackball is just like the standard Apple mouse in that dust and debris can accumulate on the rollers and impede smooth movement of the trackball.

Symptoms of a Dirty Trackball

=====

Symptoms that your trackball is dirty are:

- * The trackball appears to "stick" or "jump" when rolled.
- * The cursor will not track horizontally or vertically.
- * It sometimes seems like the cursor is "hitting a wall."
- * The movement of the cursor on the screen isn't smooth.
- * The trackball is physically difficult to roll.

How to Clean the Trackball

=====

Step 1

Remove the trackball retaining ring by turning it counterclockwise until it pops out (about 1/4 turn). You don't need tools for this; you can just press against the two small ridges on the ring with your fingernails.

Step 2

Lift the retaining ring and trackball out of its cavity.

Step 3

Locate the small rubber rollers at the left and bottom sides of the trackball cavity. Depending on your model, they may look like small rings or wheels.

Step 4

Use any reasonably clean, blunt object (such as your finger or a cotton swab) to wipe off the rollers. Do not use any liquid, including any amount of cleaning fluid or water, inside the computer.

Step 5

Locate the three bearings located at approximately clockwise 4:00, 7:00, and 11:00 in all PowerBooks except the PowerBook 100, which has three black posts instead of bearings. Using a fingertip, dry cotton swab, or other blunt object, clean them of any debris.

Step 6

Replace the trackball and the retaining ring.

In addition, on a PowerBook 140 or 170, reseating the cables on the trackball and keyboard may solve the problem. This is very effective if the failure is related to the computer heating up. These cables are located inside the PowerBook, so your authorized service provider or Apple must do this.

12) Question: How do I back up the files on my PowerBook 145B or 150?

Answer: Instructions for backing up the information on the PowerBook 145B or PowerBook 150 are available in the online Apple Technical Information Library. Use the search string "PowerBook 145B and backup" to locate the article "PowerBook 145 & 150: Backup and Restore Instructions." The instructions are also detailed in the User's Guide that comes with both computers.

13) Question: I made a backup of the information on my PowerBook 145B/150 hard drive. Now I would like to restore just one of my control panels. Can I restore a single file from the backup?

Answer: No. The PowerBook 145B and 150 backup does not allow for restoring single files.

14) Question: I did not make a backup of the system software on my PowerBook 145B (or PowerBook 150), and now I think I need to reload the operating system. I do not want to upgrade to System 7.5. Where can I get a new copy of the software that came with my PowerBook?

Answer: You can order a pre-made backup of the operating system for a PowerBook 145B and 150 by contacting Apple at 800-767-2775. A shipping and handling fee will apply.

15) Question: I am upgrading my PowerBook with Express Modem to System 7.5. What version of the Express Modem software should I be using?

Answer: You should upgrade your Express Modem software to at least version 1.5.3. Earlier versions may not work properly with System 7.5.

16) Question: Can the PowerBook 5300/190 use two batteries simultaneously?

Answer: Yes, the PowerBook 5300/190 expansion bay (where the floppy disk drive normally is) can accept a battery. BTI (800-982-8284) is in the process of releasing such a battery as of this writing. Since the expansion bay does not pass AC power through, any battery used through the expansion bay will require its own power supply for charging.

17) Question: Where else can I go for answers?

Answer: If you haven't done so already, check the other PowerBook FAQ documents. Also, depending on where you found this FAQ, you should have access to Apple's Technical Information Library (TIL). This library contains thousands of technical articles which are easily searchable using boolean search strings.

AppleSearch 1.5: Work with Network Firewalls (11/95)

Revised: 11/30/95
Security: Everyone

AppleSearch 1.5: Work with Network Firewalls (11/95)

=====

Article Created: 30 November 1995

TOPIC -----

This article describes getting AppleSearch 1.5 to work with network firewalls.

DISCUSSION -----

You may be having problems getting AppleSearch Server v1.5 to work properly with network firewalls. Since the AppleSearch Server v1.5 does WAIS communications, it should be set it up as a WAIS connection when configuring the network firewall.

About Firewalls

Firewalls are not as static and immutable as the name suggests. They are essentially filters that look for particular types of network traffic and allow or disallow the packets to proceed, accordingly. Internet services identify themselves by a port or socket number which is attached to each packet. These packets are usually what firewalls look at with their filters. WAIS operates on socket 210, so when the network administrators configure the firewall, they can allow 210 traffic to pass. This allows WAIS and the AppleSearch Server v1.5 to work correctly within network firewalls.

LaserWriter Driver 8.3.2: Requirements (11/95)

Revised: 11/30/95
Security: Everyone

LaserWriter Driver 8.3.2: Requirements (11/95)

=====

Article Created: 30 November 1995

TOPIC -----

What Macintosh models and version of the Mac OS can the LaserWriter 8.3.2 printer driver software be used with?

DISCUSSION -----

The LaserWriter 8.3.2 software, which was included with the System 7.5.2 Printing Update v1.1, can be used in place of any version of the LaserWriter 8.x software. The LaserWriter 8.3.2 driver is supported on any Macintosh computer using System Software 7.1 or greater.

The Read Me file for the LaserWriter 8.3.2 driver mentions it corrected issues on new PCI-based Power Macintosh computers, however these issues could have occurred (in extremely rare cases) on previous Macintosh computer too.

Macintosh: Unimplemented Trap Error Message Explained (11/95)

Revised: 12/1/95
Security: Everyone

Macintosh: Unimplemented Trap Error Message Explained (11/95)

=====

Article Created: 30 November 1995

TOPIC -----

This article describes what a trap is in the Mac OS. It also explains why you might occasionally get an "Unimplemented Trap" error message.

DISCUSSION -----

The Macintosh operating system (Mac OS) operates by using a series of interrupts to perform an operation. When an application draws a line, for example, it sends a specially encoded instruction to the microprocessor. The microprocessor decides if this is one of the 200+ fundamental instructions that are part of the microprocessor, if it is not, it calls a software routine called a "trap dispatcher". This routine then calls a software routine (usually in ROM) which draws the line.

If the instruction received by the microprocessor is improperly formatted, but appears to have the characteristics of a trap, it still sends it to the trap dispatcher. If the trap dispatcher cannot handle it, then you get an unimplemented trap message.

While unimplemented trap errors can be spurious and caused by software. If you get this error message consistently performing a function on your Macintosh, it could be a real software related error. When you consistently get unimplemented trap errors, you should look at the software on your hard disk since it could be corrupted, or incompatible. Software issues can result from the use of incompatible or corrupt third-party drivers, control panels, or extensions. But, these errors are not limited to third-party products, they can also result from the use of corrupted system software.

To correct these problems, you should remove the third-party extension, control panel, or application, or reinstall your system software.

DOS Compatibility Card: What is APPLEPC.EXE? (11/95)

Revised: 11/30/95
Security: Everyone

DOS Compatibility Card: What is APPLEPC.EXE? (11/95)

=====

Article Created: 30 November 1995

TOPIC -----

I have a DOS Compatibility Card, and noticed there is something called APPLEPC.EXE that is loaded in my AUTOEXEC.BAT file. What does APPLEPC.EXE do?

DISCUSSION -----

APPLEPC.EXE, in conjunction with WINCLIP.EXE, lets you copy-and-paste between Microsoft Windows and the Mac OS. APPLEPC.EXE normally loads in AUTOEXEC.BAT, and WINCLIP.EXE is located in the Startup group in Windows.

If you want this functionality and do not have it, reinstall from the disk labelled "DOS Compatibility Card Installer Disk for DOS Environment".

If you do not want this functionality, you can remove both of these items.

Newton Keyboard: Auto-Capitalization Disabled (12/95)

Article Created: 30 November 1995
Article Reviewed/Updated: 15 December 1995

TOPIC -----

When I have the Newton Keyboard attached to my Apple MessagePad 120 with the Newton OS 2.0 installed, I have found that fields that would automatically capitalize, do not with the keyboard attached. Why?

DISCUSSION -----

This is actually the way it is supposed to work. The soft keyboard does not always reflect what the Newton keyboard types. If you press the caps lock key on the Newton keyboard, the soft keyboard does not change and the Newton keyboard types upper case letters while the soft keyboard types lower case letters. The MessagePad cannot set the state of the caps lock, or shift keys on the Newton keyboard.

Apple MessagePad: Trouble-Shooting the Newton Print Pack (4/97)

Revised: 4/18/97
Security: Everyone

Apple MessagePad: Trouble-Shooting the Newton Print Pack (4/97)

=====

Article Created: 1 December 1995
Article Reviewed/Updated: 18 April 1997

TOPIC -----

When using the Apple MessagePad and the Print Pack Cable, I either get the message that no printer is connected, or I am unable to select one of the printer drivers when trying to print. What should I do?

DISCUSSION -----

The Newton print pack cable is a "smart cable". The cable contains both a serial to parallel cable converter and a ROM that stores printer drivers for Epson FX/LQ, HP LaserJet, Canon BubbleJet, and HP DeskJet printers. When the MessagePad is powered on, the print pack cable and the MessagePad communicate and transfer the drivers from the ROM to MessagePad's system memory. When the MessagePad is turned off and on again, without the cable attached, the drivers are flushed from system memory.

Most of the problems with the Print Pack cable involve the loading of the drivers from the ROM in the cable. To ensure that the MessagePad and cable are initialized and configured correctly, follow these steps:

Step 1

Turn the MessagePad and the printer off.

Step 2

Attach the cable between the MessagePad and the printer

Step 3

Turn MessagePad on. Wait 10 seconds. During this wait time, the LED on the print pack cable should flash twice - the first flash is short, the second flash is longer.

Step 4

Turn the printer on.

Step 5

Try to print.

If you still have problems printing, reset the MessagePad and try again. If the MessagePad powers off unexpectedly while printing or immediately after being turned on, try fresh batteries, or use an AC adapter. The Print Pack cable draws a lot of power at start up. This is when the Apple MessagePad is downloading the drivers. The Print Pack cable also draws a lot of power while printing.

You should repeat these steps anytime the MessagePad is turned off or disconnected from the cable and printer and reconnected.

IMPORTANT:

You need to attach the Apple MessagePad to the cable with both the printer and Apple MessagePad off, then power the devices on. These are outlined in steps (3) and (4).

Sometimes, if the printer is turned on while turning the MessagePad on, the cable gets confused and does not transmit the drivers to the Apple MessagePad. This only happens with some printers. If you follow the steps listed earlier, you will get a good connection between printer and Apple MessagePad.

LaserWriter 8.2.2: Read Me File (12/95)

Revised: 12/1/95
Security: Everyone

LaserWriter 8.2.2: Read Me File (12/95)

=====

Article Created: 1 December 1995

TOPIC -----

This article contains the ReadMe file from the LaserWriter 8.2.2 printer software.

DISCUSSION -----

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference.

The software on this disk includes version 8.2.2 of the Apple LaserWriter 8 printer driver, which works with many Apple LaserWriter printers. This document includes information about the software, as well as about several of the printers.

What's new in version 8.2.2

=====

With version 8.2, some applications could cause documents to be faxed instead of printed to printers installed with PostScript fax options. With version 8.2, printers on an multi-zone Ethernet network sometimes failed to appear in the Chooser. Both problems are fixed in version 8.2.2.

Installing the Printer Driver Software

=====

The manual that comes with your printer contains detailed installation instructions. You cannot install the software and fonts by dragging their icons; you must use the Installer program as described in the printer manual.

Please note: before installing the printer software, you should restart your system with all Extensions turned off. To do this, hold down the Shift key while

you restart your computer.

The Installer does not remove versions of the LaserWriter printer driver that are older than version 8.0. You may remove these files from your System Folder if you no longer need them.

The Installer does remove older versions of the LaserWriter 8 driver (for example, LaserWriter 8.0) and replaces the PPD files for Apple LaserWriter printers with the latest versions.

When you choose Easy Install, the Installer places the following files in the System Folder on your hard disk. LaserWriter 8 and LaserWriter GX are placed in the Extensions folder. The PPD files which are used by LaserWriter 8 are in a folder called Printer Descriptions also located in the Extensions folder. TrueType fonts are installed in the Fonts folder if you have System 7.1 or later; they are installed in the System file if you have System 7.0. The Apple Printer Utility and LaserWriter Utility are placed in the System Folder.

Please note: if the Installer is unable to remove old files from your hard disk, it will terminate the installation procedure. If this happens, please remove old copies of the LaserWriter 8 driver and the PPD files. Then move your Fonts folder from the System Folder to the desktop. Run the installer again. Once completed, move the fonts from the Fonts folder on the desktop back to the new Fonts folder in your System Folder.

About PPD Files

=====

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, click the Setup button in the Chooser when selecting your printer for the first time, or after installing an additional option. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

About Creating EPS Files

=====

You can create an Encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, an extremely large file may be created.

- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.
- When you create EPS files with preview information included, other applications that create their own PostScript code may not display the EPS file accurately on the screen.

About the LaserWriter Utility and the Apple Printer Utility

Installing the LaserWriter 8 driver and printer software places the Apple Printer Utility program in your System Folder. The Apple Printer Utility program is designed to work with the LaserWriter 16/600 PS printer and succeeding releases of new printers.

To configure and work with previously released LaserWriter models, use the LaserWriter Utility that came with your printer. The LaserWriter Utility is also provided on your printer software disks. You can install the LaserWriter Utility on your computer's hard disk by using the Custom install option of the Installer.

Using the LaserWriter 8 Driver With LaserWriter Printers

=====

When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers

- The LaserWriter 8 driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text in some documents reflows or is clipped to fit the new imageable area. To maintain your document format when printing to different printer models, deselect the Larger Print Area option in the Page Setup Options dialog box.
- Some older printers with small amounts of memory will not print documents containing large numbers of fonts unless the Unlimited Downloadable Fonts option is selected in the Page Setup Options dialog box. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup Options dialog box and print again.
- Printing multiple documents with the Finder may not work if the documents have been created by different application programs.
- If you encounter a time-out (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.

LaserWriter IIg and IIx

..TIL19003-LaserWriter_8-2-2-Read_Me_File_12-95.pdf

- When you select paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.
- The US Legal paper size has been changed on some LaserWriter II^f/II^g printers to be more compatible with other Apple LaserWriter printers. If your legal-sized documents no longer fit on the page, select Larger Print Area in the Page Setup Options dialog box.
- Some form-printing applications cannot print forms using the Layout settings in the Page Setup dialog box.

LaserWriter II NT and II NTX

- If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.
- Do not use the B5 tray to print envelopes on a LaserWriter II NT. Use the letter tray instead.

LaserWriter Pro 600 and 630

- You cannot use Auto Select as the Paper Source in the Print dialog box to print envelopes from the optional envelope feeder.
- When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

LaserWriter Pro 810

- With some graphics applications, bitmapped graphics will be reduced by 25% in size when printed with the Precision Bitmap Alignment option in the Page Setup Options dialog box.
- When you create a PostScript file with a LaserWriter Pro 810 selected as the printer and send the file to a printer that uses PostScript Level 1, a PostScript error will occur.

LaserWriter 16/600 PS

- If Tray Switching is turned on and you have installed the optional 500-sheet feeder, and it contains the same paper size as the 250-sheet feeder, you should set up the driver to use the 500-sheet feeder as the preferred paper source for optimal printing performance. See Chapter 5 in the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

Using the LaserWriter 8 Driver With the Kanji System

=====

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.1.1 or later.

Using the LaserWriter 8 Driver With Application Programs

=====

Some application programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

- With many applications, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.

Aldus Freehand 4.0

- Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- EPS files created using the LaserWriter 8 driver from within Freehand cannot be used in other programs.

Aldus PageMaker 5.0

- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

Canvas 3.5

- When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if fonts Geneva, New York or Monaco are used.

CricketDraw III 2.01

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, underlined TrueType fonts may not print.

CricketPresents 2.1

- You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

FileMaker Pro 2.1

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Informed Manager 1.4

- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

Lotus 1-2-3 1.1

- Text printed with the Outline or Shadow text style appears filled with gray.

MacDraft 3.01 and earlier versions

- When you print using the Cut Marks option, a PostScript error results.

Microsoft PowerPoint 3.0

- Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

- Printing documents that have rotated objects with rounded corners results in a PostScript error.

Painter 2.0

- When you print using the Invert option, images do not print inverted correctly.

PixelPaint Pro 3.0

- When printing using the Invert option, images do not print inverted correctly.

QuarkXPress 3.3

- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

RagTime 3.2

- You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

- Use ReadySetGo! version 6.0 with the LaserWriter 8 printer driver; earlier versions will not work.

- You cannot print documents that use pen patterns.

Studio/8 & Studio/32

- When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.

WordPerfect 3.0

- When you select the Unlimited Downloadable Fonts option and print rotated text in Watermark, the entire document rotates when printed.

How to Get Updated Printer Software

=====

If you need to update your printer software and you have an AppleLink account, you can obtain the latest versions of the LaserWriter 8 software from AppleLink.

Follow this path to locate the LaserWriter 8 software:

Apple Products
Apple Software Updates
Macintosh
Printing Software

The latest LaserWriter 8 software is also available from Apple's ftp site on the Internet. The path is:

/ftp/dts/mac/sys.soft/laserwriter.8.2/

Macintosh Performa: Error Type 2012 (12/95)

Revised: 12/1/95
Security: Everyone

Macintosh Performa: Error Type 2012 (12/95)

Article Created: 1 December 1995

TOPIC -----

When I start up my Macintosh Performa computer, I get an error message with a number 2012. What should I do?

DISCUSSION -----

The 2012 error is generated by the Global Village software, and occurs if the Global Village software preferences are corrupted.

To resolve the issue, perform the following steps:

Step 1

Open your System Folder.

Step 2

Open your GlobalFax Personal folder.

Step 3

Throw away the following two files:

- Queue Temp
- GlobalFax Preferences

The Global Village software recreates the Queue Temp and GlobalFax Preferences files. However, certain preferences, such as your preferred local Zip Code and registration information, are lost. You may need to reconfigure this information, but you do not need to re-register your computer. Also, your address book will be left intact; there is no risk of loss of that data.

If these steps do not resolve this error, reinstall your system software. To do

..TIL19004-Macintosh_Performa-Error_Type_2012_12-95_(TA34786).pdf

this, start your computer using your Macintosh Performa CD and choose the "Restore All Software" option. This process is fully described in your Macintosh Performa User's Guide.

Newton 2.0 OS: Handwriting Recognizers Explained (5/96)

Revised: 5/7/96
Security: Everyone

Newton 2.0 OS: Handwriting Recognizers Explained (5/96)

Article Created: 1 December 1995
Article Reviewed/Updated: 7 May 1996

TOPIC -----

In the release of Newton 2.0 OS, Apple included a new handwriting recognizer. This article explains when the new recognition technology is used, and how it differs from the previous handwriting recognition technology.

DISCUSSION -----

With the release of the Newton 2.0 OS, the Newton 1.x OS the paragraph recognizer is now the cursive recognizer in the Newton 2.0 OS. The cursive recognizer learns how to adapt to your handwriting, but the printed recognizer does not.

There are several word lists in the Newton OS. These include names, cities, states and others. The only word list that can be modified by the user is the personal word list and it is imported when upgrading to the Newton 2.0 OS. All other word lists are not imported.

The printed recognizer still searches dictionaries, but considers letter-by-letter possibilities as well treating non-words as less probable.

The basic difference is that the printed recognizer does not does not learn and the letters each need to be separated buy pen lifts.

The cursive recognizer has new algorithms which have been improved for better recognition and speed.

Article Change History:
07 May 1996 - Added additional information on printed recognizer.

CLW 12/600 PS: Toner Cartridges Don't Fit or Make Noise (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Toner Cartridges Don't Fit or Make Noise (10/96)

Article Created: 1 December 1995
Article Reviewed/Updated: 23 October 1996

TOPIC -----

I am installing the toner cartridges in a Color LaserWriter 12/600 PS printer, and one of cartridges does not slide all the way into the toner bay. This toner cartridge stops and leaves about 1/8-in. extending from the toner bay. This cartridge also does not make a click sound like the other cartridges. When I try to remove the cartridge the cartridge release lever makes a noise. One time, I was able to get the cartridge into the bay, but now the toner carousel is stuck between cartridges and the printer is making a grinding noise. How can I correct this?

DISCUSSION -----

The Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS printers have four toner cartridges: black, cyan, magenta, and yellow. Each cartridge is "keyed" so that you do not accidentally put the wrong cartridge into the wrong bay. For example, putting the yellow cartridge in the black cartridge bay.

These keys can be pulled out of place, so you need to be careful when installing and removing the cartridges. The Color LaserWriter 12/600 PS User's Manual says:

"gently rock toner back and forth" in a rolling motion, not side to side (page 22).

This chart shows you where the individual key plugs belong. The cartridges are viewed label side down, with an imprint number at the bottom:

Begin_Graphic

Black
() (0)

```
( )      ( )  
---imprint #---
```

```
      Cyan  
( )      ( )  
( )      (0)  
---imprint #---
```

```
      Magenta  
(0)      ( )  
( )      ( )  
---imprint #---
```

```
      Yellow  
( )      ( )  
(0)      ( )  
---imprint #---
```

End_Graphic

When a cartridge gets stuck in the printer, use the teal colored toner carousel knob by pressing it in and rotating it clockwise until the cartridge lines up in the open bay area (you can not rotate it the counter-clockwise). Slowly pull the toner release lever out as far as it goes.

IMPORTANT: Do not force the toner release lever, doing so can damage the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printer.

NOTE:

If the toner carousel does not rotate freely, service is required.

Article Change History:

23 Oct 1996 - Added Color LaserWriter 12/660 PS to discussion.

Apple MessagePad: Trouble-Shooting Power Related Issues (12/95)

Revised: 12/1/95
Security: Everyone

Apple MessagePad: Trouble-Shooting Power Related Issues (12/95)

Article Created: 1 December 1995

TOPIC -----

This article describes some trouble-shooting techniques you can use when your Apple MessagePad will not power on.

DISCUSSION -----

When your Apple MessagePad will not power on, first check your batteries. Make sure you have good batteries, typically this problem will happen after putting in fresh batteries or removing a PC-card.

Here are some steps you can try to get the Apple MessagePad to power on. Start with step one and continue following the steps until your Apple MessagePad powers on.

WARNING:

The earlier Apple MessagePad devices (the Original MessagePad, MessagePad 100, MessagePad 110) have all data internally in SRAM, so backup your Apple MessagePad BEFORE removing all the batteries in the MessagePad.

The MessagePad 120 has user data stored in "Flash RAM", which is persistent, and the system in SRAM which needs to have power. If you have to remove all power, will NOT lose your data. However, you will have to reset Date & Time, and a few other minor settings.

Step 1

Reset the Apple MessagePad

Step 2

Plug the Apple MessagePad into AC power if you have the Newton Power Adaptor, then reset the unit.

Step 3

Remove the batteries and reset the Apple MessagePad with AC power only.

Step 4

Remove all power, including the backup battery, for at least 15 minutes. Then replace the batteries and repeat step one through three.

If after following these steps, your Apple MessagePad still does not power on, you need to have your unit serviced.

Notes:

- Resetting is always a good thing to try first on the Apple MessagePad. It is like restarting a Macintosh computer (Newton PDA devices are always sleeping, not being shut down!).
- When you take out the backup battery, the little screw is set into the metal plate so you will not lose it.

Newton 2.0 OS: Serial 9600 Package Explained (12/95)

Revised: 12/1/95
Security: Everyone

Newton 2.0 OS: Serial 9600 Package Explained (12/95)

=====

Article Created: 1 December 1995

TOPIC -----

When I tap on the Serial 9600 icon in the Newton 2.0 OS Extras Drawer, a message appears that reads: "Packages: Tapping this does nothing." I looked for a reference to the Serial 9600 package, but couldn't find anything. What does this package do?

DISCUSSION -----

The Serial 9600 package is only used when communicating with older Windows-based computers. The Serial 9600 package is a standard package that is loaded at the factory. It adds one item to the "Connection" popup (Windows - 9600). Allowing Windows users to reduce the serial speed to 9600 bps. This option was added because some older Windows-based computers cannot communicate at 38.4 Kbps.

Macintosh Performa 5300CD: Specifications (4/97)

Revised: 5/1/97
Security: Everyone

Macintosh Performa 5300CD: Specifications (4/97)

Article Created: 01 December 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article gives the technical specifications for the Macintosh Performa 5300CD computer.

DISCUSSION -----

Processor

- PowerPC 603e processor running at 100 MHz

Memory

- 16 MB of RAM minimum, installed in one of the SIMM sockets
- Two 72-pin SIMM sockets; RAM can be expanded to 64 MB (80 nanoseconds)
- 4 MB read-only memory (ROM)
- 256K Level 2 cache
- 1 MB DRAM frame buffer on board (for video support)

Storage

- Apple SuperDrive 1.4 MB high-density floppy disk drive
- Internal 1.2 GB IDE hard disk drive (1/3-height)
- Internal SCSI 4x CD-ROM player

Video

- 15" flat square shadow mask CRT
- 0.28 mm dot pitch

- Resolutions:

Begin_Table

Resolution	Max. Bit Depth	Max. Number of Colors	Frequency (Hz)
-----	-----	-----	-----
640 x 480	16	32,768	67 (60 VGA)
800 x 600	8	256	60, 72
832 x 624*	8	256	75

*Does not support video input

End_Table

• Using the optional external video connector kit, video mirroring is supported on the following external displays:

Begin_Table

External Monitor	Supported resolutions		
	640 x 480	800 x 600	832 x 624
-----	-----	-----	-----
Macintosh 13" Color Display	X		
Apple Color Plus 14" Display	X		
Macintosh Color Display	X		
Apple Performa Plus Display	X		
Apple Multiple Scan 14 Display	X	X	
Apple Multiple Scan 15 Display	X	X	X
Apple Multiple Scan 17 Display	X	X	X
Apple Multiple Scan 20 Display	X	X	X
SVGA monitors (may need adapter)	X	X	

End_Table

Sound

- 16-bit monophonic sound input
- 16-bit stereophonic sound output
- Integrated microphone for monaural sound input
- Sound input port for microphone or line input (port accepts stereophonic input, but sound is combined into monophonic sound for play-through or recording)
- Two stereophonic sound output ports, level nominally 0.5 volts RMS into 39 ohms
- Internal stereo speakers, muted whenever a plug is inserted into either sound output port

Clock/calendar

- CMOS custom chip with battery

Keyboard

- Includes AppleDesign keyboard
- Supports all Apple Desktop Bus (ADB) keyboards

Expansion & Ports

- ADB port for keyboard, mouse, and other input devices using a low-speed, synchronous serial bus
- Two serial port for printers and other serial devices*
- SCSI port for a chain of up to seven SCSI devices
- LC-compatible 68030 processor-direct slot (96/114-pin)
- Communication slot with included internal Global Village 14.4 modem.
- Built-in video capture card providing real-time video display, video capture, and overlay (60-pin)
- Built-in internal TV tuner card
- Optional monitor-out port for video mirroring (using external video connector kit, purchased separately)

*Note: The Macintosh Performa 5300CD includes an internal Global Village 14.4 modem which disables one of the external serial ports. In order to use both serial ports, the internal modem must be removed.

Additional features

- All-in-one enclosure
- Tilt from -5 degrees to +15 degrees, swivel 360 degrees
- Support for optional infrared remote control
- Front panel push-button controls for volume
- Front panel stereo headphone jack
- Power on and off from keyboard and optional remote control

Environment

- Operating temperature: 10° C to 40° C (50° F to 104° F)
- Storage : -40° C to 47° C (-40° F to 116.6° F)
- Relative humidity: 5% to 95% noncondensing
- Altitude: Works below 3048 m (10,000 ft.)

Weight

- 21.15 kg (47 lbs)

Height and Weight

- Height: 17.5" (44.5 cm)
- Width: 15.1" (38.3 cm)
- Depth: 16.0" (40.6 cm)

Apple Desktop Bus power requirements

- Maximum current draw for all ADB devices is 500 milliamperes (mA)
- Mouse draws up to 10 mA
- Keyboard draws 25-80 mA (varies with model)

Note: The maximum number of ADB devices recommended in a daisy chain connected to the ADB port is three.

AC line input

- Line voltage: 100-240 volts AC, RMS, single phase, nominal
- Frequency: 50-60 hertz (Hz)
- Power consumption: 125 watts

System Software

- Mac OS 7.5.1 with Apple Guide, AppleScript, and PC Exchange included.

Software bundle

AppleShare Client for Windows 1.0.2 Read Me File (4/97)

=====

Article Created: 1 December 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article contains the ReadMe file from AppleShare Client for Windows v1.0.2.

DISCUSSION -----

This document provides late-breaking news about AppleShare Client for Windows. It contains the following sections:

For more information

Bugs fixed

- Duplicate AppleTalk node IDs
- Cisco router incompatibility
- Incorrect default group access privileges

Disk space requirements

Installing from a hard disk

Network adapter support

- Windows for Workgroups 3.11 and unsupported network adapters
- Windows 3.1 and 3.11 and unsupported network adapters

Changing the location of print spool files

Viewing Mac OS-formatted files from Windows and DOS applications

Text-file differences between Mac OS and Windows

Saving the battery charge on your portable computer

Supported printer drivers

Obtaining updated LaserWriter printer drivers

Useful network utilities

Obtaining information about Apple products for DOS and Windows

Removing the Farallon PhoneNET PC product

WinZip incompatibility

Using Open Transport

Documentation Errata

For more information

=====

Refer to the following documentation for more information:

"Getting Started With AppleShare Client for Windows"-- This printed manual describes how to install the AppleShare Client application.

AppleShare Client Installer Help--This file describes installing, uninstalling, and re-installing the AppleShare Client application. AppleShare Client Installer Help is available through the AppleShare Client Installer.

AppleShare Client Help--This file describes the features of the AppleShare Client application and how you use it to share network resources. AppleShare Client Help is available through the AppleShare Client application.

PROBLEMS.WRI--This file describes potential problems you might encounter while installing and using the AppleShare Client application, describes possible causes for those problems and provides suggested solutions to those problems. PROBLEMS.WRI is stored on the AppleShare Client for Windows Disk 1. During installation, it is copied into the C:\APPLE\A_SHARE directory by default.

USERINST.WRI--This file, located on the AppleShare Client for Windows Disk 2, describes how to install the AppleShare Client application. This file is provided to allow the system administrator to modify the installation instructions for site-specific purposes and distribute them to users. During installation, it is copied into the C:\APPLE\A_SHARE directory by default.

Bugs fixed

=====

This version 1.0.1 of AppleShare Client for Windows includes fixes for a few bugs found in version 1.0. They are as follows:

Duplicate AppleTalk node IDs

In version 1.0, particularly with large networks, it was possible for a client computer to assume an AppleTalk node identifier that was already being used. This problem could be represented by an apparent inability to see any nodes in a particular zone, or by a general slowdown in network performance.

Cisco router incompatibility

Cisco model 7000 routers are incompatible with AppleShare Client for Windows, version 1.0. These routers are supported by AppleShare Client for Windows, version 1.0.2, but may take longer to connect to a file server.

Incorrect default group access privileges

AppleShare Client for Windows, version 1.0.2, automatically sets the group access privileges of a newly created folder to those of the enclosing folder. In version 1.0, group privileges for such new folders were incorrectly set to None by default.

Disk space requirements

=====

To install and run AppleShare Client for Windows, you should have a minimum of 3.5 MB of free space on your hard disk. To use the Uninstall option of the Installer to remove AppleShare Client for Windows, you need to have 1.5 MB of free space.

Installing from a hard disk

=====

You can run the Installer from a local (non-network) hard disk drive to install or remove the AppleShare Client for Windows software. To do so, create a directory on your hard disk and copy all the files from both AppleShare Client for Windows floppy disks into that directory. Then, run the INSTALL.EXE program from that directory, and follow the installation instructions in the online help or the printed book Getting Started with AppleShare Client for Windows.

IMPORTANT! Do not run the INSTALL.EXE program from a connected AppleShare server to perform an upgrade.

Note that if a previous version of AppleShare Client for Windows is already installed on your computer, you will first have to remove the old version (by using the Uninstall option of the Installer) before installing the new version. After your computer has been restarted, run the INSTALL.EXE program again to install the new version.

Network adapter support

=====

Before installing AppleShare Client for Windows, you should determine whether you are using supported network adapter hardware. If your network adapter is not in the following list, you may still be able to use AppleShare Client for Windows. For more information, see the section "Windows for Workgroups 3.11 and Unsupported Network Adapters" or "Windows 3.1 and 3.11 and Unsupported Network Adapters," as appropriate for your version of Windows.

Windows for Workgroups 3.11 and unsupported network adapters

If you are using Windows for Workgroups 3.11, use your Windows for Workgroups installation disks to install your network adapter. Once the network adapter is working in Windows, you can install the AppleShare Client for Windows software using the normal installation procedures.

Windows 3.1 and 3.11 and unsupported network adapters

If you are using Windows 3.11 or Windows 3.1 without Windows networking software, and you have an a vendor-supplied ODI driver for your unsupported network adapter, you may be able to use the procedures in this section to install AppleShare Client for Windows.

WARNING:

Installing your system for networking requires that you manually install the network adapter driver and edit your driver configuration file and your DOS startup batch files. Performing these procedures incorrectly can cause your computer to fail.

Before performing the following procedures, you should locate the software and documentation that came with your network adapter. As you perform the procedures, you will need information from the documentation.

1. If your network adapter is not already installed, install and test it, following the instructions in your network adapter documentation.
2. Restart your computer and run Windows.
3. Run the INSTALL.EXE program on the AppleShare Client for Windows Disk 1.
4. In the Installation Options dialog box, choose the Standard Installation option and click Continue.

The Select Adapter dialog box appears.

5. Select the line at the end of the adapter list that reads "[Other] Unlisted Adapter Option," and click OK.

The Network Adapter Settings dialog box appears.

- 6 Enter the configuration settings for your network adapter.

If possible, select values that match the adapter configuration settings you used in completing step 1 above. If no matching settings are displayed, simply continue with step 7. If you are already running ODI-based networking software, AppleShare Client for Windows Installer will use your existing network adapter configuration settings.

7. Complete the AppleShare Client for Windows installation.
8. Exit Windows and restart your computer as instructed by the Installer.

If your computer was not already running ODI-based networking software, continue with step 11.

9. If your computer was already running ODI-based networking software using your network adapter card, edit the file ATDRIVER.BAT (in the C:\APPLE\A_SHARE directory by default). Remove the word "REM" from the beginning of the last line so that it reads "C:\APPLE\A_SHARE\ODI.EXE".
10. Restart your computer.

AppleShare Client for Windows is completely installed and should run when you start Windows. Skip the rest of this procedure.

11. Use DOS to copy the ODI driver and any supporting files for your network adapter to your AppleShare Client for Windows directory. The default directory path is C:\APPLE\A_SHARE.
12. Edit the NET.CFG file in the C:\APPLE\A_SHARE directory.

First, replace all strings of four consecutive X characters (that is, XXXX) with the file name of your driver, excluding the .COM extension for the file.

Next, change any parameters that do not match your adapter configuration settings. Check the values for the following parameters:

- the interrupt request level, a one- or two-digit number preceded by INT #1
- the I/O port number, a 3-digit value such as 300, preceded by PORT #1
- the direct memory access channel, a value of 1 or 2 preceded by DMA
- the memory access address, a data address value such as D8000, preceded by MEM

You should consult your network adapter card documentation to determine if other parameters are required for your system.

Finally, save the NET.CFG file.

13. Edit the file ATDRIVER.BAT (in the C:\APPLE\A_SHARE directory by default). First, remove the word "REM" from the beginning of every line. Next, replace the string "XXXX" in the second line of the file with the filename of your network adapter driver. Be sure to include the filename extension.
14. Save the ATDRIVER.BAT file.
15. Restart your computer by turning it off and on.

AppleShare Client for Windows is completely installed and should run when you start Windows.

If you experience any problems after completing these instructions, see the file C:\APPLE\A_SHARE\PROBLEMS.WRI.

Changing the location of print spool files =====

You may want to change the location of the spool files used by the AppleShare Client to store PostScript print jobs until they can be sent to the networked LaserWriter printer. For example, you may want to store these files in their own directory or on a disk with more free space. Do not change the spool file location to a floppy disk or to a CD-ROM disc. It is recommended that you do not change the spool file location to a removable cartridge drive or a network drive unless you are certain that it will be available at all times.

To change the location of the spool files, you must edit the [ports] section of the WIN.INI file. There are three spool files, each on its own line, in the form C:\LWx.prn=. Edit each line to change the pathname of the file. Do not change the filename itself (LWx.prn). Also be sure to retain the equal sign (=) at the end of the line. Do not add a colon before the equal sign; it is a special identifier only for ports such as LPT1: and COM1:.

Viewing Mac OS-formatted files from Windows and DOS applications

=====

AppleShare Client for Windows hides Macintosh files that contain resource forks to prevent their being damaged by an incompatible application or operating system. See the section "Macintosh File Formats" in AppleShare Client Help for additional information.

AppleShare Client for Windows can be prevented from marking these files as hidden, thereby allowing access to the portions of these files that Windows applications might be able to use. To prevent hiding these files, add the following lines to the ASHARE.INI file (C:\WINDOWS\ASHARE.INI):

```
[FileRedir]
HIDERESFILES=FALSE
```

Warning:

Changing this value does not change the format of Macintosh files; you should use these files only with great care.

Text file differences between Mac OS and Windows

=====

A Mac OS-formatted text file contains a single character to indicate the end of a line of text. Windows text files contain two characters for this purpose. Some Windows-based text-viewing programs like NOTEPAD and WRITE require text files to contain the DOS/Windows two-character ASCII combination (line feed and carriage return) to indicate the end of a line. Consequently, an entire text file created on the Macintosh may appear as a single line of text to such applications.

If a text file that you create under Windows is opened and then saved (even as a text file) by a Mac OS-based application, the file will be formatted for the Mac OS. Many word processing applications can process multiple file formats. Other low-cost file- and text-translation utilities are readily available for converting text files and other types of documents.

Saving the battery charge on your portable computer

=====

Most portable computers minimize battery drain by running the hard disk only when necessary. To provide timely printing of your files, the AppleShare Client print spooler checks the disk every five seconds for pending print jobs. This level of disk activity can significantly shorten the battery charge time. If your computer is not printing to a network printer, you may want to disable the print spooling temporarily.

One easy way to disable the print spooler is to disconnect all assigned network printers. To disconnect printers, click the print services button in the main AppleShare Client window, select each printer, and click Disconnect.

Supported printer drivers
=====

Drivers for some of the newest LaserWriter printers may not work yet with AppleShare Client for Windows. If the driver for your printer does not seem to work, try setting printer driver options as described in the file PROBLEMS.WRI, or install a supported driver. The supported drivers should work for your printer, but may not support the advanced features of that printer.

Note that the Apple LaserWriter printer driver disks do not come with your AppleShare Client for Windows, Version 1.0.2, product if you purchased it as an upgrade. The installation process does not affect installed printer drivers. If you need to reinstall Apple printer drivers, you can use the driver disks that came with your printer or with AppleShare Client for Windows, Version 1.0.

Provided with Windows installation disks:

Apple LaserWriter
Apple LaserWriter Plus
Apple LaserWriter II NT
Apple LaserWriter II NTX

Drivers provided with AppleShare Client for Windows, Version 1.0:

Adobe Default Printer
Apple LaserWriter 16/600 PS
Apple LaserWriter Pro 600
Apple laserWriter Pro 630
Apple LaserWriter Select 320

Obtaining updated LaserWriter printer drivers
=====

Windows LaserWriter drivers available for the following printers can be obtained from the sources listed below.

LaserWriter Pro 810
LaserWriter Select 360
LaserWriter Select 310
Personal LaserWriter NTR
LaserWriter Pro 600/630

Useful network utilities
=====

The PC Exchange utility from Apple computer allows you to use your Macintosh computer to format floppy disks for PC computers and to store PC-formatted files on your floppy disks and SCSI hard drives. PC Exchange can be purchased at Apple dealers, and it is included for free in the Mac OS System 7.5.

The PC Net Exchange utility associates a PC icon with PC files stored on a Macintosh server. If you have PC Exchange installed, adding PC Net Exchange allows you to specify document-to-application and document- to-icon mapping based on the filename extension. PC Net Exchange can be downloaded for free from the following sources:

Removing the Farallon PhoneNet PC product
=====

Farallon PhoneNET PC cannot be used on the same computer with AppleShare Client for Windows. To avoid disabling your existing network services, the AppleShare Client for Windows Installer currently will not run if PhoneNET PC is already installed. If you want to replace PhoneNET PC with AppleShare Client for Windows, you must first remove PhoneNET PC from the system. At the time this

Read Me file was written, no commonly available utility is known to successfully remove the entire PhoneNET PC. This section details how to remove the product so that you can install AppleShare Client for Windows. (You must perform steps 2 and 5 at a minimum to install AppleShare Client for Windows successfully.)

IMPORTANT:

Before you remove any network software, you should ensure that no important application depend on that software.

The files that you will change or delete are located in four directories:

C:\
C:\PHONENET
C:\WINDOWS
C:\WINDOWS\SYSTEM

To remove the PhoneNET PC product, perform the following steps:

1. Back up all PhoneNET PC files and all system files that contain references to them:

In the directory C:\
CONFIG.SYS
AUTOEXEC.BAT

In the directory C:\PHONENET
All files. Especially important are the NET.CFG file and the network adapter driver file. You can recognize the driver by the .COM extension of its filename. When you install AppleShare Client for Windows, you will re-install the driver, and you may need to enter the settings for your network adapter card that are contained in the NET.CFG file.

In the directory C:\WINDOWS
SYSTEM.INI
WIN.INI
PROGMAN.INI
DOSAPP.INI
PHONENET.INI
PHONENET.GRP
TIMBUKTU.BMP
TIMBUKTU.HLP

In the directory C:\WINDOWS\SYSTEM
ADSP.DLL
PNTPROTO.DLL
PNTDATA.DLL
FPRINT.386
PNTALK.DRV

2. Delete or "remark out" any command lines in the AUTOEXEC.BAT file that reference or call PhoneNET PC batch files. For example, if your system is configured to start PhoneNET PC when your system boots, your AUTOEXEC.BAT probably contains the following command line, which must be deleted:

```
CALL C:\PHONENET.BAT
```

You should delete or remark any command lines calling the following batch files and executables:

```
AARP.COM  
ABOTH.BAT  
AFILES.BAT  
APRINT.COM  
APRNT.BAT  
ASHARE.COM  
ASP_WS.COM  
ATALK.COM  
EXTEND.BAT  
PNTVDD.EXE
```

3. Edit the C:\CONFIG.SYS file.

In the command line beginning "LASTDRIVE=" set the drive letter to P.

4. Delete the C:\PHONENET directory and all the files in it. These files are as follows:

```
3C509.COM  
AARP.COM  
ABOTH.BAT  
AFILES.BAT  
ANET.EXE  
APRINT.COM  
APRNT.BAT  
ASHARE.COM  
ASP_WS.COM  
ATALK.COM  
ATNET.DLL  
CHOOSER.EXE  
CHOOSER.HLP  
COMPAT.COM  
DA.DTA  
DA.EXE  
DA.HLP  
DESPOOL.EXE  
EXTEND.BAT
```

LSL.COM
MAKECFG.EXE
MINSES.EXE
NET.CFG
PAP_WS.COM
PHONENET.BAT
PHONENET.WRI
PNSN
PNTVDD.EXE
QIAO.DLL
README.DOC
REDIR.EXE
ROUTE.COM
SETUP.LOG
SPOOL (a subdirectory)
TB2.EXE
TB2RECPB.DLL
TB2TOOLS.DLL
TIMBUKTU.WRI

5. Edit the C:\WINDOWS\SYSTEM.INI file.

In the [boot] section, change
"network.drv=pntalk.drv" to "network.drv="

In the [boot.description] section, change
"network.drv=PhoneNET PC" to
"network.drv=No Network Installed"

In the [386Enh] section, remove the following lines:
"device=fprint.386"
"PhoneNETMemoryPool=n" (where n is any number)

Remove the entire [fprint] section

6. Edit the C:\WINDOWS\WIN.INI file.

In the [windows] section, delete the following line:

"load=PNNOTIFY.EXE"

Delete the entire [MacintoshToPC] section
Delete the entire [PCToMacintosh] section

7. Edit the C:\WINDOWS\PROGMAN.INI file.

In the [Groups] section, find the following line:

"Group(n)=C:\WINDOWS\PHONENET.GRP"

Make a note of the group number (n).

In the [Settings] section, edit the line beginning "Order=" to delete the group number (n) that you noted.

In the [Groups] section, delete the Group line:
"Group(n)=C:\WINDOWS\PHONENET.GRP"

8. Edit the C:\WINDOWS\DOSAPP.INI file.

In the [DOS Applications] section, delete all lines that refer to the C:\PHONENET directory. These include the following:

```
C:\PHONENET\ANET.EXE=1
C:\PHONENET\ASHARE.COM=1
C:\PHONENET\APRINT.COM=1
```

9. From the C:\WINDOWS directory, delete the following files:

```
PHONENET.INI
PHONENET.GRP
TIMBUKTU.BMP
TIMBUKTU.HLP
```

10. From the C:\WINDOWS\SYSTEM directory, delete the following files:

```
ADSP.DLL
PNTPROTO.DLL
PNTDATA.DLL
FPRINT.386
PNTALK.DRV
```

WinZip incompatibility

=====

The shareware compression/decompression utility WinZip is not completely compatible with AppleShare Client for Windows, Version 1.0.2. The WinZip Open Archive dialog box includes a Network button for connecting to a network drive. If you use this button with AppleShare Client for Windows installed, you receive an error message. To connect to a network drive, use the network connection item in the Disk menu from the File Manager.

Using Open Transport

=====

If you are running Open Transport, you must use the latest version available to ensure compatibility with AppleShare Client for Windows.

Documentation errata

=====

Your documentation may refer to this product as AppleShare Client for Windows version 1.0.1. AppleShare Client for Windows 1.0.2 includes a recently developed change to ensure correct installation on systems running NetWare. This minor improvement is the only difference between the two versions.

Password Security Control Panel (12/95)

=====

Article Created: 2 December 1995
Article Reviewed/Updated: 8 December 1995

TOPIC -----

I want to use the Password Security control panel, which came on my new Macintosh Powerbook, on my desktop Macintosh too. Can I do this?

DISCUSSION -----

The Password Security control panel is part of the PowerBook System 7.5.2, and only works on a limited number of Powerbook computers. Here is a list of PowerBook computers the Password Security control panel currently works with.

- PowerBook 190 series
- PowerBook Duo 2300 series
- PowerBook 5300 series

The components of System 7.5.2 do not function on earlier Macintosh systems. However, many of the new technologies included in System 7.5.2 will be rolled into future operating system updates.

Newton Backup Utility: Only Performs Backup with 1.3 OS (12/95)

Revised: 12/4/95
Security: Everyone

Newton Backup Utility: Only Performs Backup with 1.3 OS (12/95)

=====

Article Created: 4 December 1995

TOPIC -----

I downloaded the Newton Backup Utility from an online service, and I am having problems using it with my Apple MessagePad 100 with Newton 1.3x OS. When I establish a connection with my Macintosh computer, Newton Backup Utility only allows me to backup my Newton. Once the backup is performed, the connection is dropped. When I establish the connection again, I still only have the option to backup my Apple MessagePad. Why?

DISCUSSION -----

The Newton Backup Utility is designed for use with the Newton 2.0 OS. Using the Newton 1.3 OS on an original MessagePad, the MessagePad 100, MessagePad 110, or MessagePad 120, only the ability to backup your data is allowed. The only reason to use the Newton Backup Utility with the Newton 1.3 OS is if you are upgrading an Apple MessagePad 120 to Newton 2.0 OS. When upgrading, you need to use the Newton Backup Utility to backup your Apple MessagePad, then once the Newton 2.0 OS upgrade is performed, restore your data using the Newton Backup Utility. You only get the additional options of installing packages, and restoring your Apple MessagePad with the Newton 2.0 OS installed.

Newton 2.0 OS: Package Activation Issues (2/96)

Revised: 2/5/96
Security: Everyone

Newton 2.0 OS: Package Activation Issues (2/96)

=====

Article Created: 4 December 1995
Article Reviewed/Updated: 5 February 1996

TOPIC -----

This article discusses package activation issues with the Newton 2.0 OS.

DISCUSSION -----

Getting Rid Of Undeleteable Apps
=====

Here's a tip to help you deal with incompatible applications - even ones that mess the system up so badly you cannot delete them.

The procedure is quite simple. The first section should be enough to get you going. The rest is for people who want more details.

Previously, if you had a package on the internal store that caused trouble at startup your only option was to completely erase the internal store (reset with the power switch down). Similarly, if you had a package on a card that interfered with mounting the card you had to force the card to be erased (insert the card with Prefs open).

In Newton 2.0 OS it is possible to suppress package activation. This allows the unit to start up, or a card to be inserted without running any of the packages' code. This gives you a chance to delete the problem package instead of having to completely erase the store it is on. Macintosh users will find it reminiscent of starting up with the shift key down to keep extensions from loading.

Suppressing Package Activation on Internal Store
=====

To suppress package activation on the internal store:

Step 1

Reset the Apple MessagePad

Step 2

Turn the Apple MessagePad over and hold the pen down in the left 1/4-in. of the screen. Keep the pen down until you see a message asking if you want to activate the packages on the internal store.

Step 3

Select "No."

When you open the extras drawer you will see X's over some of the icons. This indicates those packages are not active. This procedure does not affect the packages that are built into the ROM. Only the packages you have loaded, or that were pre-loaded onto the unit at the factory can be disabled in this way.

The only "trick" is that you can put the pen down too far to the left - resting against the raised edge of the plastic case. There is a small "dead" area at the border of the screen and the case that you need to avoid.

Note:

If you are using a PIN number, you should wait until the PIN number box appears on the screen before pressing down on the left side of the screen.

The message comes up before the splash screen disappears, so if the splash screen disappears, you need to try again - holding the pen a little further in from the edge.

Activating a Package Once It Has Been Deactivated

=====

Tapping on an icon with an X causes the package to be activated. Activate them one at a time until you identify the package giving you trouble. For example, if the symptom is the Names application will not open anymore, tap on an icon with an X, and once the X disappears see if the Names application works.

If at this point you can delete the icon, do so. If it messes up the extras drawer, you'll have to reset again suppressing package activation. This time you should just delete the icon without first activating it.

When searching for the offending apps remember to look in the extensions folder (or show "All Icons"). In 1.X systems there were some packages that did not have a corresponding icon in the extras drawer. In 2.0, every package has at least one icon.

Storage Cards

=====

The same procedure can be applied to cards. Insert the card. After you lock it, hold the pen down near the left edge of the screen. You will be asked if you want to activate the packages on the card.

Resetting Orientation and Backdrop Application - A More Advanced Trick =====

If you reset the unit and hold down the pen near the top edge of the screen (instead of the left edge), in addition to suppressing package activation, the unit's orientation and backdrop app will be reset to their defaults - portrait orientation and Notepad as backdrop.

This is useful if you have some application that seems to be working fine - until you make it the backdrop.

The top edge only has these additional features when you reset the unit. When inserting storage cards, you can use the top or left edge to suppress package activation.

Other Times Icons are X'd Out =====

An icon with an X indicates its package is inactive. Even if you don't suppress package loading, there are other circumstances when you might run into inactive packages. The most common would be if you have two copies of the package installed. For example, package "foo" is on the internal store and a card containing "foo" is inserted. The icon for "foo" on the card will have X over it.

There might be other odd circumstances where you briefly see an X. For example, moving a package between stores causes it to be deactivated, moved, then reactivated. We try not to show the X in this situation because the package is only temporarily inactive, but in some circumstances the X is briefly visible.

If you see an inactive icon, go ahead and tap on it. The system will attempt to activate and launch it. If there is a problem you will get an error message. The message should be an informative one like: "The package "foo" (on store "my card") was not activated because a package by the same name (on store "internal") is already in use."

Package Freezing =====

If you do not know what frozen packages are, you probably will soon.

** There are a variety of third party developers providing utilities that turn on this latent feature of the Extras Drawer.**

Frozen packages are inactive packages. The difference is that they are purposely made inactive by the user and stay inactive until the user taps on them. Suppressing package activation as described above only deactivates packages

temporarily. If you reset the unit (or reinsert the card), the icons that were X'd out won't be anymore.

Activating packages uses up some of the system's working memory and takes time. Cards with a large number of packages can take a long time to mount and can cause you to run low on memory.

A way to work around this is to selectively "Freeze" (deactivate) the packages you don't use very often. You freeze a package or group of packages by selecting them in the Extras Drawer and choosing freeze from the action button. Its icon will turn into a snowflake indicating that it's frozen. You thaw (activate) a frozen package by simply tapping on it.

The package freezing feature in the Extras Drawer is not available by default. You need to get a utility package to turn it on.

Multiple Scan 1705 Display: Use Included Cable (12/95)

Revised: 12/5/95
Security: Everyone

Multiple Scan 1705 Display: Use Included Cable (12/95)

=====

Article Created: 4 December 1995

TOPIC -----

I am replacing an existing monitor with the Apple Multiple Scan 1705 Display. I left the cable from my previous monitor connected to my Macintosh computer, and used the included adapter to connect the other end of the existing cable to the Multiple Scan 1705 Display. When I power on the computer and display, the power light on the display remains amber, and I do not get any video. What is happening?

DISCUSSION -----

The Multiple Scan 1705 Display uses a different connector than previous monitors. You must use the cable that shipped with the Multiple Scan 1705 Display. The adapter that shipped with the display is required for only for PC-compatible computers. The adapter should not be used with any Macintosh cable.

Connecting to a Macintosh Computer

=====

To connect the Multiple Scan 1705 Display to the built-in video on a Macintosh computer, connect one end of the included video cable into your Macintosh and the other end into the monitor. Do NOT use the PC adapter.

Connecting to a PC-Compatible Computer

=====

To connect the Multiple Scan 1705 Display to a PC-compatible computer, connect one end of the included video cable into the display. Next, connect the PC adapter to your computer's video card. Then connect the other end of the included cable into the PC adapter.

At Ease: Trouble When Sharing a Floppy Disk? (12/95)

Revised: 12/4/95
Security: Everyone

At Ease: Trouble When Sharing a Floppy Disk? (12/95)

=====

Article Created: 1 December 1995

TOPIC -----

I have my At Ease lab set up so two students store their documents on one floppy disk.

The problem I am encountering is the first student will access his documents on the disk, eject it and hand it to the second student to access his documents on another workstation. When the first student gets the disk back, the computer does not recognize the disk. It displays the message: "Please insert the Disk named 'Disk Name'" even though that is the disk that is in the floppy drive. What is wrong?

DISCUSSION -----

The problem you are encountering is not related to At Ease, but the way the Finder handles floppy disk operations.

When a disk is ejected from your computer, you will notice an unhighlighted disk image remains on the desktop. This is the Finder retaining the disk's contents in RAM. When the disk is inserted into another computer, information about the floppy disk called the checksum value is changed. When the disk is returned to the first computer, the operating system, does not recognize it as being the disk stored in RAM because of the different checksum value.

If you drag the disk image to the Trash before taking it to the second computer, the disk information is not saved in RAM, the unhighlighted image does not stay on the desktop, and when you return the disk to the first computer it mounts and is recognized. The problem with this workaround is if a file on the disk is still in use, you cannot drag the disk to the Trash.

At Ease handles ejected disks as if they are ejected not trashed and thus retains the disk information causing the problem you are experiencing with students sharing the same disk. There are two options for you to resolve this.

1. The best solution is to provide each student with their own floppy disk. If two students share disks, they both have access to the other student's work, which is usually not desirable anyway.

2. If student's accessing each other's work is not a concern, and you have hard drive storage space, setup At Ease so the students save to the Shared Folder on the hard drive or At Ease disk and avoid using floppies entirely. Follow these steps to setup a Shared Folder:

Step 1

Open the At Ease Setup program.

Step 2

Double-click the Setup you want to modify.

Step 3

Click the Locations icon (it looks like a floppy disk) to access the Locations panel.

Step 4

In the "Store user documents on:" section, click to select "Setup location volume"

Click to select "Allow access to shared folder"

Step 5

Click "OK".

HyperCard 2.3: Specifying Operands for Picture XCMD (12/95)

Revised: 12/5/95
Security: Everyone

HyperCard 2.3: Specifying Operands for Picture XCMD (12/95)

=====

Article Created: 4 December 1995
Article Reviewed/Updated: 5 December 1995

TOPIC -----

In HyperCard 2.3.x the Picture XCMD will not work correctly if the "clipboard" option is used. For example, in the script:

```
picture "Test", clipboard, roundrect
```

In HyperCard versions previous to 2.3, the above command works fine. When the above command is used in HyperCard 2.3 and 2.3.3, the program opens a dialog asking you to find the file called "Test". It seems as though the word "clipboard" is not being recognized correctly.

DISCUSSION -----

In HyperCard 2.3, "clipboard" (command to get/set the text contents of the clipboard) was added to HyperTalk. You now need to quote the word "clipboard" when you pass it to the Picture XCMD.

In versions of HyperCard prior to 2.3, "clipboard" did not have a special meaning, so when the parser saw an unquoted "clipboard" that was not already used as a variable, it passed the string "clipboard" to the XCMD.

You should quote "roundrect", also. In general, it is good practice not to rely on unquoted literals, if possible.

AppleVision 1710AV: Proper Setup for Microphone (12/95)

=====

Article Created: 05 December 1995

TOPIC -----

How can I properly set up the microphone on my AppleVision 1710AV Display?

DISCUSSION -----

To verify that the AppleVision 1710AV Display is properly set up, follow these steps:

Step 1

Make sure that the audio cables are plugged into the correct places on the computer. An easy way to check this is to verify that the icon on the cable matches the icon on the computer's port.

Step 2

Use Macintosh Guide to properly set up the software. The setup varies depending on which computer the display is connected to.

Step 3

Set the microphone to the highest quality sample rate (44 kHz) and bit depth (16-bit).

Macintosh: Free Space Available on Floppy Disks (12/95)

Revised: 12/5/95
Security: Everyone

Macintosh: Free Space Available on Floppy Disks (12/95)

=====

Article Created: 05 December 1995

TOPIC -----

I have two floppy disks of the same size, but each one has a different amount of free space available even after initializing them. What is causing them to be different?

DISCUSSION -----

Beginning with system software version 7.0, the Disk Initialization Manager tries to initialize a disk even if it contains some bad blocks; this feature is called bad block sparing.

Without bad block sparing, the Disk Initialization Manager considers a disk unusable even if just one block is bad. With bad block sparing, however, the Disk Initialization Manager attempts to work around the bad block by removing it from the pool of available free blocks. This prevents the File Manager from allocating the block to a file.

The bad block sparing occurs during the disk-zeroing phase of disk initialization - with the only visible sign of the sparing process being an additional dialog box containing the message "Re-verifying Disk."

Except in cases involving critical blocks on a disk, the Disk Initialization Manager can usually initialize a disk that would previously have been rejected as invalid. However, if more than 25 percent of the disk is found to contain bad blocks, if the I/O errors appear to be due to hardware failure rather than media failure, or if certain critical sectors are bad then the disk initialization fails just as it would have without the bad block sparing.

Critical sectors of a disk that must be good even on a spared disk include the boot blocks, the master and alternate master directory blocks, the volume bitmap, and the initial extents for the catalog and extents B-Tree files of the volume.

Note: This information is taken from Inside Macintosh: Files.

LaserWriter 16/600 PS Fax: Windows 95 Compatibility (6/96)

Revised: 9/4/96
Security: Everyone

LaserWriter 16/600 PS Fax: Windows 95 Compatibility (6/96)

=====
Article Created: 6 December 1995
Article Reviewed/Updated: 26 June 1996

TOPIC -----

I am trying to send a fax with my LaserWriter 16/600 PS fax printer using Microsoft Windows 95. The Windows driver I downloaded from online services does not work. Is the driver compatible with the printers fax feature?

DISCUSSION -----

Apple does not provide a PostScript fax compatible driver for Microsoft Windows 95. There may be some third-party options available, but we do not know of any. In order to use the fax capabilities of the LaserWriter 16/600 PS printer, you must use a PC-compatible running Windows 3.1 upon which to install the Windows PS Fax software, or a Macintosh computer and the LaserWriter 8.2.3f driver.

Windows Clients on AppleShare Servers

IMPORTANT: Be sure to review this entire document. It contains important information about your Workgroup Server and system software. You may want to print this document for reference.

About Your System and Server Software

=====

About System Software Version 7.5.1

- Your Workgroup Server contains all improvements and new features for system software version 7.5 plus all enhancements and features included in the System 7.5 Update, version 1.0, and the Network Software Installer (NSI) version 1.4.5.

IMPORTANT: Be sure to check the Fixes folder, in the Extras folder, on the Workgroup Server Software CD-ROM disc for any late-breaking software fixes that you might want to add to your system.

- MacTCP network connection software is included with System 7.5 and users may ask you for help with it. The MacTCP control panel provides a way for users to connect to networks that use the TCP/IP protocol, such as the Internet. However, after setting up the MacTCP control panel, users still need one or more network applications to use TCP/IP. Example network applications include client software for the World Wide Web, terminal emulators, and Email programs. For information on MacTCP and TCP/IP in general, see the MacTCP Administrator's Guide version 2.0 in the Electronic Library folder on your Workgroup Server Software CD-ROM disc.

System Software Exceptions for Workgroup Servers

- Starting with System 7.5 Update 1.0, the Power On key can also function as a Power Off key—but not for Workgroup Servers. To prevent accidental disruption of network services, this functionality has been removed.
- Although the CPU Energy Saver control panel is included in the Apple Extras folder on the server's hard disk, it is not recommended for use with servers. Moreover, this control panel only works with Workgroup Servers 8150 (80 MHz) and 9150 (80 MHz).

Workgroup Server Warnings

- Do not turn on virtual memory

The virtual memory option in the Memory control panel does not improve the performance of server applications. Some server applications, such as the Apple Internet Router, can't run with virtual memory turned on. To improve performance, install additional memory. The Technical Information booklet for your server describes how much memory can be added.

- About installing more memory (DRAM SIMMS)

As you add more server applications, control panels, extensions, fonts, etc., you may want to add memory to the server. To avoid damage to your server, Apple Computer recommends that only an Apple-authorized dealer or service provider install additional memory packages, called DRAM SIMMS. The SIMMS must be the correct type for your server, added in same-size pairs, and installed in paired slots. Incorrect installation of DRAM SIMMS can result in errors, unpredictable results, and damage to your equipment and data.

Re-creating a Factory-Installed Startup Disk

If your server's startup disk should become damaged, see the instructions for re-creating a factory-installed startup disk in the "About This CD" document on the Workgroup Server Software CD-ROM disc. If you need to re-install AppleShare after re-creating your startup disk, see the AppleShare Installation and Upgrade Guide.

NOTE: If you want to use the server's startup disk with Apple RAID Software, see the instructions for reformatting the disk in the Apple RAID Software Administrator's Guide.

About PowerTalk and QuickDraw GX

These optional programs are not recommended for use on a server, but if you want to use them, you can find the appropriate Installers in the System Software Installers folder on the Workgroup Server Software CD-ROM disc.

Order of Installing and Starting Up Server Software

Check Before Installing

If you plan to install server application software such as AppleShare, AppleSearch, or Apple Remote Access, the order in which you install and start these programs is important. Be sure to review the documentation for all the server application programs that you plan to use before installing and running them. Note that the order in which you install is dependent on whether you are using the server for file, print, or database applications. For example, AppleSearch uses the AppleShare File Server to transmit its reports, so AppleShare must start up before AppleSearch.

Use the Correct Versions

Be sure to use these (or later) versions of server software with your Workgroup

Server:

- AppleShare File and Print Server 4.1
- AppleTalk Internet Router 3.0.1
- Apple Remote Access 2.0.1
- AppleSearch Server 1.5

Tips

====

Using the Auto Power On/Off Control Panel

Starting with System 7.5, you can use the Auto Power On/Off control panel to set the WS 8150 and WS 9150 to automatically restart after a power failure. You can also use this control panel to set a time when the server automatically shuts down and starts up. Due to its hardware design, the WS 6150 cannot use this feature.

Using the Energy Saver Control Panel

You can use the Energy Saver Control Panel to set how long the server can remain idle before the system dims the monitor screen.

Using the Shutdown Items Folder

The Shutdown Items folder in the System Folder allows you to specify scripts or programs that automatically run during shutdown. This folder works much like the Startup Items folder. To specify an item to run during shutdown, put the item into the Shutdown Items folder and then choose Shut Down or Restart from the Special menu. (Do not choose Shut Down from the Apple menu. It will not launch items in the Shutdown Items folder.)

Reconnecting to a Server

When connection to a server is unexpectedly lost, the server's icon remains dimmed on the screen. If you double-click the dimmed icon or choose the server from the Recent Servers item in the Apple () menu, you see a message telling you that the disk could not be opened because you do not have the required access privileges. Before you can reconnect to the server, you must close any open files, and then drag the server's dimmed icon to the Trash. If you need to save your work on an open file, use Save As to save it on a different disk.

Cleaning a DAT Drive

The Workgroup Server DDS-2 DAT drive option is approved for use with the Apple cleaning cassette P/N 654-0002. This cleaning tape is the "dry" type cleaner. Don't use the "wet," alcohol style cleaning tapes. Note that, in general, cleaning tapes that work with DDS-2 drives also work with (the original) DDS drives, but DDS cleaning tapes should not be used with newer DDS-2 drives.

Troubleshooting

=====

IMPORTANT: Be sure to review the Troubleshooting chapter of your Workgroup Server Administrator's Guide.

Problems Starting Up on a Network

Sometimes during heavy network traffic a server may not start up correctly. You may hear a prolonged "beep" during this process. Try disconnecting the Ethernet cable before startup, and reconnecting it after startup. You'll also need to switch back to EtherTalk in the Network control panel.

Problems Rebuilding the Desktop

Some Apple and non-Apple extensions may interfere when you need to rebuild the server desktop. To prevent problems, turn off all extensions except Macintosh Easy Open before you rebuild. After rebuilding, turn the extensions you want to use back on.

To rebuild the desktop, follow these steps:

- 1) First, use the Extensions Manager to save a record of extensions that you use.
 - Open the Extensions Manager control panel.
 - Open the Sets pop-up menu, and choose Save Set.
 - When the Save Set dialog box opens, type a name (for example, 'My Extensions').
- 2) Turn off current extensions by choosing All Off in the Sets pop-up menu.
- 3) Turn on Macintosh Easy Open by clicking to put a checkmark beside it.
- 4) Restart your computer while holding down the Command and Option keys.
- 5) When you see the dialog box alerting you to the loss of your Info window comments, release the keys and click OK.
- 6) When the desktop is rebuilt, open the Apple menu and choose Control Panels.
- 7) Open the Extensions Manager control panel.
- 8) Turn extensions back on by selecting the set you saved in step 1.
- 9) To activate your extensions, restart the computer .

QuarkXPress Problems

To use QuarkXPress with System 7.5 on a Workgroup Server, you must upgrade to QuarkXPress version 3.3.1 or later. For upgrade information contact Quark, Inc., at 1-800-788-7835.

ISO 9660 and High Sierra CD-ROM Disc Problems

Discs in the ISO 9660 and High Sierra formats have version numbers attached to filenames. Some application programs need these version numbers in order to use the files. If you have problems using an ISO 9660 or High Sierra CD-ROM with a program, follow the instructions below to make the version numbers available to the program:

- 1) Make sure the application program you want to use with the CD-ROM is active.
- 2) Drag the CD-ROM icon to the Trash to eject the disc.
- 3) Hold down the Option key while you reinsert the disc. Keep holding down the Option key until the disc is in the player. The program should now be able to locate the filenames on the CD-ROM disc.

If You Need to De-Install PowerTalk

Follow the steps below if you need to remove PowerTalk software from the server.

- 1) Restart with all extensions off by holding down the Shift key during startup.
- 2) Open the System Folder and drag the PowerTalk Data folder to the Trash.
- 3) Open the Apple Menu Items folder, in the System Folder, and drag the Mail and Catalogs folder to the Trash.
- 4) Open the Control Panels folder and drag PowerTalk Setup to the Trash.
- 5) Open the Extensions folder in the System Folder and drag these to the Trash:
 - AppleTalk Service (the PowerTalk extension)
 - Catalogs Extension
 - Mailbox Extension
 - PowerTalk Extension
 - PowerTalk Guide (Apple Guide document)
 - PowerTalk Manager (system extension)
- 6) Open the Preferences folder, in the System Folder, and drag these to the Trash:
 - AppleMail Letterheads (folder)
 - PowerTalk Setup Pref (PowerTalk Manager preferences document)
 - PowerTalk Startup Pref (PowerTalk Manager preferences document)
- 7) Close the System Folder.
- 8) Drag the PowerTalk folder, in the Apple Extras folder, to the Trash.
- 9) Choose Empty Trash from the Special menu.
- 10) To complete the de-installation, restart the server.

About Macintosh PC Exchange and DOS-Formatted Media

=====

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with PC Exchange and should not be used while PC Exchange is installed. Version 2.0 of PC Exchange contains an easier and more intuitive method for accessing DOS and Apple II ProDOS disks on a Macintosh.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option.

ClarisWorks Version 1.0v2 or Earlier

Some versions of ClarisWorks cannot read or write files on DOS-format floppy disks. To open a PC document in ClarisWorks, you must first copy the document to your computer's hard disk. Always save ClarisWorks documents on your Macintosh hard disk. You can then copy the documents to a DOS-format floppy disk. Contact Claris to obtain version 1.0v3 or later of ClarisWorks.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other MS-DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Macintosh, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With PC-Format Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the Macintosh-, DOS-, or ProDOS-format partitions as individual logical drives on the Macintosh desktop. If the disk contains both Macintosh and DOS-format partitions, however, PC Exchange will only recognize the Macintosh partition. In addition, PC Exchange will only recognize ProDOS-format partitions on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Macintosh-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Macintosh, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working With DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize SCSI removable media devices, you must turn on the device and eject any cartridges before you turn on your Macintosh system.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply re-insert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on an

PC-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. Do not use the MS-DOS Fdisk command to initialize a removable media cartridge. In addition, you should use the MS-DOS Format command to format the disk before you copy DOS files to a newly initialized removable media cartridge on a PC.

When you initialize a removable media cartridge on an PC-compatible computer, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working With DOS-Format SCSI Hard Disk Drives

In order for PC Exchange to recognize SCSI hard disk drives, you must turn on the drive before you turn on your Macintosh.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

For initializing an external SCSI hard disk on a PC-compatible computer, use the MS-DOS Fdisk command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. Use the MS-DOS Format command to format the disk before you copy DOS files to a new SCSI hard disk on a PC.

Macintosh PC Exchange Tips and Problems

-
- A "Sad Mac" error may occur on your Macintosh if a removable media cartridge is left in the drive during startup. To keep this problem from occurring, manually eject removable media cartridges from the drive before you turn on your Macintosh.
 - PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Windows Clients on AppleShare Servers

=====

Mac OS and DOS/Windows systems store and maintain files differently. Use caution when sharing files on an AppleShare server accessible to DOS/Windows users. Follow these basic rules to avoid problems:

- Store your Mac OS files, especially applications, in different folders than your DOS/Windows files.

Opening, moving, copying, or duplicating Macintosh files on the server can damage those files. Separating the two types of files, especially applications (which can only work on one system) minimizes accidental damage. A DOS/Windows client can easily determine where a file originated.

- Set access privileges to prevent unauthorized use.

An innocent mistake by a DOS/Windows user, such as accidentally placing a DOS/Windows folder in a Mac OS folder, can cause damage.

- Inform users about how to avoid problems.

If your Mac OS and DOS/Windows clients need to share files, tell them to copy those files to their own system, modify them if necessary, and save them to the server under another name. They should not change the original file. Many files can be opened by applications other than those that were used to create them; once changed by a different application, a file could be permanently damaged.

- Use the more limited DOS/Windows conventions for naming shared files whenever possible.

The DOS/Windows file system supports filenames of eight or less characters with an optional extension consisting of a period and three or less characters. Most special characters (spaces, asterisks, brackets, and so forth) are not allowed; letter case is insignificant.

The server processes names of files that do not conform to DOS/Windows naming conventions so that DOS/Windows clients can view them. For your convenience, clicking the filename in an Info window for the file displays the filename that the DOS/Windows clients will see. (To display the Info window, select the file in the Finder and choose Get Info from the File menu.) Names that result from this processing begin with an exclamation mark (!).

Workgroup Server ReadMe Additions (1/96)

Revised: 1/5/96
Security: Everyone

Workgroup Server ReadMe Additions (1/96)

=====

Article Created: 6 December 1995
Article Reviewed/Updated: 5 January 1996

TOPIC -----

This article is the WS Read Me Additions file.

DISCUSSION -----

About These Additions

This document contains some last minute information that didn't make it into the Workgroup Server Read Me. You may want to print this document for future reference.

Adobe Acrobat Low Memory Problems

The Adobe Acrobat Reader 2.0.1 needs a bit more than 3 megabytes of memory to work properly. If there is not enough memory available, the program asks that you reinstall Adobe Type Manager (ATM). This is usually not necessary. Instead, free up memory by quitting applications and try opening Acrobat Reader again. To avoid low memory problems, consider having an Apple-authorized service provider install more memory in your server.

NOTE: If you agree to the terms of the Electronic End User License Agreement (in the Adobe Acrobat 2.0 folder), you can distribute Adobe Acrobat Reader 2.0.1 to as many clients as you like. Doing this allows those client systems to read files in the Portable Document Format (pdf).

Installing Adobe Acrobat from the Workgroup Server Software CD-ROM

The Acrobat Installer is in the Adobe Installers folder in the Electronic Library folder on the Workgroup Server Software CD-ROM disc. During installation, the Adobe Acrobat Installer tries to put the ATM Font Database file in the startup disk's System Folder. Thus, if you start up from the Workgroup Server Software CD-ROM and then try to install Acrobat on your hard

disk, the installation will fail (Error -44). If you want to install Acrobat on the server's internal disk, startup from the hard disk. After installation you can move the application to a more convenient location.

Problems Ejecting a CD-ROM Disc

The Workgroup Server 6150/66, 8150/110 and 9150/120 use the new AppleCD 600i drive. This CD-ROM drive offers twice the performance of previous models. It also uses new CD-ROM driver software.

When the Workgroup Server starts up, if a CD-ROM disc with a startup System Folder is inserted in the drive, the server uses the driver software on the disc rather than its own driver. As of March 1995, very few startup CD-ROM discs contain driver software that is completely compatible with the AppleCD 600i drive.

If the server starts up using older CD-ROM drive software, one known problem occurs: the server may not be able to eject the CD-ROM disc as expected. To eject the disc, restart the server and push the open/close button on the CD-ROM drive as soon as possible.

To avoid this problem, insert a CD-ROM disc AFTER the server starts up.

Retrospect Remote Memory Problems

Workgroup Servers that include a DAT drive also include Retrospect Remote 2.1Ai backup software.

The Retrospect 2.1B Updater in the Fixes Folder on the Workgroup Server Software CD-ROM disc solves a problem in Retrospect 2.1Ai that occurs in the following rare circumstance: When your startup volume has between 2 and 3 gigabytes of available space, Retrospect reports that it does not have enough free hard disk space to launch.

Note: This problem in Retrospect 2.1A only occurs with a startup volume. Retrospect 2.1A has no problem backing up other volumes that are larger than 2 gigabytes.

If you encounter this problem with Retrospect 2.1A, use the 2.1B Updater in the Fixes Folder on the Workgroup Server Software CD-ROM disc.

SerialDMA & Serial Port Arbitrator Compatibility Issue (12/96)

Revised: 12/3/96
Security: Everyone

SerialDMA & Serial Port Arbitrator Compatibility Issue (12/96)

=====

Article Created: 6 December 1995
Article Reviewed/Updated: 3 December 1996

TOPIC -----

This article describes a compatibility issue when using a PCI-based Power Macintosh computer with the 7.5.2 Printing Fix 1.1 and Apple Remote Access (ARA) with some telecommunication applications, or Fax software.

DISCUSSION -----

System 7.5 Update 2.0
=====

The newer architecture of the SerialDMA included in System 7.5 Update 2.0 does not have the same problem, therefore you should install this update which upgrades your system to version 7.5.3. Also, the next version of ARA (Personal Server and Client) will have a new Serial Port Arbitrator that no longer exhibits this problem (there is no known date when a newer version of ARA will be available).

Explanation and Workaround for System 7.5.2
=====

Users of PCI-based Power Macintosh (7200, 7500, 8500, or 9500) computers and the 7.5.2 Printing Fix 1.1 may encounter problems. There appears to be a compatibility issue between the Serial Port Arbitrator extension (part of ARA) and the SerialDMA 2.0.2 extension (part of the printer update) if both load at start up. This issue may appear at computer start up or when attempting to dial out to an online service or using a telecommunication application.

This issue may also affect Global Village Fax features. As mentioned above the SerialDMA 2.0.2 extension conflicts with the Serial Port Arbitrator extension, which inhibits the ability to Fax when ARA is set to answer calls in the Remote Access Setup control panel. In addition, users should rename the SerialDMA 2.0.2

extension (for example, place a space in front, " SerialDMA 2.0.2") so this extension loads before the GlobalFax extension. Global Village is working on a solution to correct this, however, no date is known when this solution will be available.

Workaround

To avoid this conflict, try one of the following:

- Remove the Serial Port Arbitrator extension from the System Folder.
- If you are using Global Village Fax features, turn off the Fax Receive feature in the Global Village Fax Center whenever dialing out with online service software or telecommunication software.

For more information on the Serial Port Arbitrator and ARA, please refer to the Tech Info Library article titled, "Serial Port Arbitration and Apple Remote Access". Use the search string "Serial Port Arbitrator and ARA".

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:

- 03 Dec 1996 - Corrected spelling.
- 02 Jul 1996 - Added Fax Doc word
- 14 May 1996 - Added System 7.5 Update 2.0 information.

Power Macintosh 5200/75 LC: Flashing Question Mark (12/95)

Revised: 12/11/95
Security: Everyone

Power Macintosh 5200/75 LC: Flashing Question Mark (12/95)

=====

Article Created: 06 December 1995
Article Reviewed/Updated: 11 December 1995

TOPIC -----

I have a Power Macintosh 5200/75 LC computer, and I am getting a flashing question mark at startup. What could be causing this?

DISCUSSION -----

There are a number of possible causes to the flashing question mark symptom that you are experiencing. Follow these steps to resolve this issue:

Step 1

Rule out causes such as: damaged or missing system software, SCSI configuration problems, third-party software conflict, or corrupted PRAM. If you need assistance with this, see Tech Info Library article, "Flashing Question Mark on the Screen: Causes and Cures."

If the symptom persists, perform step 2.

Step 2

Download the latest version of Drive Setup, which is available on the online services. Make sure you are using at least version 1.0.3. Copy it to a floppy disk or external volume.

Step 3

Start up from the system software CD-ROM disc and use Disk First Aid to check the hard disk. If Disk First Aid reports problems and can repair them, repair them and continue to step 4.

If Disk First Aid reports problems that it is unable to repair, take necessary recovery steps and reformat hard drive with Drive Setup 1.0.3.

IMPORTANT: If you reformat the hard drive, you will lose all the data on the disk. Be sure to make a complete backup of any data you wish to keep before reformatting.

Step 4

Quit Disk First Aid. Open Drive Setup 1.0.3 from a floppy disk or external volume.

Step 5

Select the internal IDE drive and select Update driver from the Functions menu.

Step 6

Perform a clean installation of the system software. If you need assistance with this, see Tech Info Library article, "System 7.5: Clean Install Procedure".

Step 7

If you continue to experience the flashing question mark at startup, contact an Apple-authorized service provider for additional assistance.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Drive Setup 1.0.3: Read Me (12/95)

=====

Article Created: 06 December 1995
Article Reviewed/Updated: 11 December 1995

TOPIC -----

This is the Read Me file for Drive Setup 1.0.

DISCUSSION -----

What's New in Drive Setup 1.0.3?

- No changes to SCSI driver. This is the same SCSI driver that is included with Drive Setup 1.0.2.
- Installs updated IDE driver (ATA v1.12) for systems that were previously supported by previous versions of Drive Setup.
- Some Apple IDE hard drives require extra time to flush its caches at shut down and restart. This new IDE driver insures that the drive's caches are properly flushed.
- Corrects an issue with the PowerBook 190, 2300 and 5300 series of computers where, in some cases, the system will freeze after wake up.

Drive Setup 1.0.3 requires System Software 7.5 (or later) and is only supported for use with the following systems:

- Power Macintosh systems (including PowerPC-based Performa systems)
- Macintosh 580- and 630-series systems
- PowerBook 190, 2300, and 5300

Drive Setup does not currently support the Macintosh Processor Upgrade. If the upgrade is installed in a Macintosh 580- or 630-series system, use the "601 Processor Upgrade" control panel to turn the card off before using Drive Setup.

Power Macintosh 7200 & 7500: Difficulty Mounting CDs (12/95)

Revised: 9/23/96
Security: Everyone

Power Macintosh 7200 & 7500: Difficulty Mounting CDs (12/95)

Article Created: 07 December 1995

TOPIC -----

I have a Power Macintosh 7200 series computer. When I hold down the C key and try to start up the computer using the system software CD-ROM disc, I get a flashing question mark. I am also having difficulty mounting other CD-ROM disks.

DISCUSSION -----

The Power Macintosh 7200 and 7500 series computers have a "kickstand" or bracket which prevents the internal component cage from opening. However, if this bracket is not secure, it can cause enough tension on the internal SCSI ribbon cable to pull it from the SCSI connector. This is the likely cause of the difficulties you are experiencing with CD-ROM discs.

To resolve this, snap the bracket securely into place and then reconnect the internal SCSI ribbon cable.

Power Macintosh 7500 and 8500: Technical Info Update (12/95)

Revised: 5/21/96
Security: Everyone

Power Macintosh 7500 and 8500: Technical Info Update (12/95)

=====

Article Created: 07 December 1995

TOPIC -----

This article contains an update to the Technical Information booklet that came with your Power Macintosh 7500 or 8500 series computer.

DISCUSSION -----

The following table replaces the table in the section titled, "Assigning SCSI ID Numbers":

Begin_Table

SCSI bus	SCSI ID	Device
-----	-----	-----
Internal*	0	factory-installed hard disk
	1	available
	2	available
	3	factory-installed CD-ROM drive (optional)
	4	available
	5	available
	6	available
	7	Power Macintosh computer
External	0	available
	1	available
	2	available
	3	available
	4	available
	5	available
	6	available
	7	Power Macintosh computer

End_Table

*Although five or six SCSI ID numbers are available for assignment, only one other SCSI device can be connected to the internal SCSI chain because of space limitations.

The following table replaces the table in the section titled, "Audio and Telecommunication Devices":

Begin_Table

Device	Voltage	Current	Power
-----	-----	-----	-----
Microphone	+5 V	20 mA	100 mW
GeoPort telecom adapter	+5 V	500 mA	2.5 W
S-video input connector	+12 V	250 mA	3.0 W

Performa & PowerBook: Global Village Modem Too Loud (4/96)

Revised: 4/15/96
Security: Everyone

Performa & PowerBook: Global Village Modem Too Loud (4/96)

=====

Article Created: 7 December 1995
Article Reviewed/Updated: 15 April 1996

TOPIC -----

I have a Macintosh Performa computer with a built-in Teleport Gold 11v modem, and I cannot disable the modem sound. I turned it off in the Teleport control panel and turned down the sound volume in the Sound control panel. However, when the modem dials, it is still loud. The same thing happens with my PowerBook 5300 series computer and PowerPort Mercury PC Card. What can I do?

DISCUSSION -----

In the Teleport (or PowerPort) control panel, there is a volume slider that you can use to adjust the speaker volume when the GlobalFax software is sending a fax. However, volume slider affects the modem volume for faxing only. If you are using another telecommunications program, you will have to adjust the modem volume in it. If you need assistance in configuring these settings, contact the software publisher.

If the communications application supports AT commands, then you can use them to modify the initialization or hangup strings. AT commands are a way of communicating directly with the modem. ATM0 turns off the modem sound; ATM1 turns it back on. The Ln commands set the volume from very low (L0) to loud (L3).

If the application supports an initialization string suggest that the customer use the ATM0 or ATL0 commands to turn off or turn down the speaker, respectively. If it also supports a "hangup string," use an ATM1 or ATL1, L2, or L3 command to re-enable the speaker.

Elementary Reference Bundle: Dinosaur Adventure Trouble (1/96)

Revised: 1/29/96
Security: Everyone

Elementary Reference Bundle: Dinosaur Adventure Trouble (1/96)

=====

Article Created: 7 December 1995
Article Reviewed/Updated: 29 January 1996

TOPIC -----

I have the Apple Elementary Reference bundle. I am having difficulty with the Dinosaur Adventure CD-ROM disc that came with my bundle.

When I launch the Dinosaur Adventure application, I get a message, "Could not find file 'KA Icons'. Please reinstall Dinosaur Adventure." There is no installer and the instructions state I can run the program from the disc directly without installing anything on to my hard drive.

The application launches fine if I double-click the Dinosaur Adventure application right after starting my computer. What is wrong?

DISCUSSION -----

You will receive this error message if you try to run the Dinosaur Adventure application while File Sharing is turned on in your Sharing Setup control panel. It takes a few minutes for file sharing to turn on when you first start your computer which is why you are able to launch the application right after turning on your computer.

Use the following procedure to make sure File Sharing is turned off before launching the Dinosaur Adventure application:

Step 1

Choose Control Panels under the Apple Menu.

Step 2

Double-click on the Sharing Setup control panel.

Step 3

If the button in the File Sharing section of the Sharing Setup control panel reads Start, go to Step 4.

If the button in the File Sharing section of the Sharing Setup control panel reads Cancel, click Cancel. Go to Step 4.

If the button in the File Sharing section of the Sharing Setup control panel reads Stop, click Stop. Go to Step 4.

Step 4

Close the Sharing Setup control panel.

Step 5

Open the Preferences Folder in the System Folder. If there is a file called KA Dino CD D Prefs in the Preferences Folder, drag it to the Trash and empty the Trash.

Step 6

Launch the Dinosaur Adventure application.

Macintosh Quadra 950: ROM Socket (12/95)

Revised: 12/7/95
Security: Everyone

Macintosh Quadra 950: ROM Socket (12/95)

=====

Article Created: 07 December 1995

TOPIC -----

The Macintosh Quadra 950 logic board has ROMs that are soldered to the board, but the logic board also has a ROM socket. Why is this. Should I have something in the ROM SIMM socket?

DISCUSSION -----

The ROM socket is available so that an updated set of ROMs could be added. Many Apple logic boards have an empty ROM socket for possible ROM updates. However, if the ROMs are already soldered to the board, you do not need anything in the ROM socket.

FWB Hard Disk Toolkit: System 7.5.2 Incompatibility (6/96)

Revised: 6/5/96
Security: Everyone

FWB Hard Disk Toolkit: System 7.5.2 Incompatibility (6/96)

=====

Article Created: 08 December 1995
Article Reviewed/Updated: 04 June 1996

TOPIC -----

I have a PCI-based Power Macintosh computer which uses System 7.5.2. Recently, I've noticed that my hard disk has become locked, and I'm unable to write anything to the disk. I am using FWB Hard Disk Toolkit to mount an external drive. What could be going on?

DISCUSSION -----

Versions earlier than 1.8 of FWB Hard Disk Toolkit are incompatible with System 7.5.2 and higher. FWB does have a solution for users who are experiencing this problem. This solution is described in the Read Me included with the FWB utility, Unlock Volume.

Contact FWB's technical support center for additional assistance.

LaserWriter 16/600 PS: TCP/IP Configuration Guide (4/96)

Revised: 4/29/96
Security: Everyone

LaserWriter 16/600 PS: TCP/IP Configuration Guide (4/96)

Article Created: 8 December 1995
Article Reviewed/Updated: 29 April 1996

TOPIC -----

This article describes configuring TCP/IP communications to a LaserWriter Pro 16/600 PS.

DISCUSSION -----

To Find the IP Address and Other TCP/IP Configuration Information

The IP Address

To find the IP address use one of the choices below:

- Print a test page.
- Apple Printer Utility1.
- TELNET to printer and display the current configuration information.

Subnet and Default Gateway Displayed

To find the subnet and default gateway use one of the choices below:

- Use the Apple Printer Utility to display the Configuration Page.
- Use TELENET (option x) and connect to the printer to display the Configuration Page.

RARP and BOOTP

On startup, if the IP address is set to 0.0.0.0 (or has never been set), the LaserWriter 16/600 PS will issue BOOTP and RARP requests roughly every 5 seconds. If your printer has ROM version 1.0, these requests seem to be

continuous, while ROM version 2.0.x these requests seem to stop after 64 seconds, or 12 broadcasts.

Verifying the IP Address when using RARP or BOOTP

The Apple Printer Utility will correctly display the current IP address. Network management software may also display the current IP address.

Since the "permanent" address is still 0.0.0.0, printing a test page by restarting the printer will not display the served IP address. The test page will still report, "IP address: 0.0.0.0".

Configuration Switch and RARP or BOOTP

Does the configuration switch on the printer affect RARP and BOOTP? No, RARP or BOOTP work if the switch is set in up or down position.

How do I Manually Assign the IP Address

=====

If the "permanent" address at 0.0.0.0 can I use gleaning?

If the IP address has been set permanently, how do I change it?

You can use one of the following:

TELNET and use option x
apple printer utility

NOTE: RARP, BOOTP and IP gleaning do not work here.

Turning IP Off

=====

There is no way to completely turn off all IP functions on the printer. However, customers who ask, "How do I turn IP off," are actually asking for two different configurations.

1) Disable network configuration protocols (RARP, BOOTP, DHCP)

To prevent the printer from requesting network configurations from network servers with RARP, BOOTP, or DHCP, you should manually assign an address to the printer.

2) Keep IP hosts from printing to the printer

If you want to hide your printer from the TCP/IP network, and not let other hosts print to the printer, assign an IP address to the printer that is not in use. This will cut off all printing from outside the subnet. Local LPR clients will still be able to use the printer.

Support Issues

=====

Acquires Wrong Address

Because the printer is using a BOOTP or RARP server, the printer is in glean mode when the address is 0.0.0.0, some users may see this issue. Subnets with heavy ARP traffic or malfunctioning systems may accidentally configure the printer. The printer may accept the wrong configuration method. For example, the network administrator wanted the printer configured with RARP, but a BOOTP server responded more quickly. A user's printer unintentionally "steals" a number from a BOOTP server.

BOOTP Client Using Another Client's BOOT Address

This is a known problem. The BOOT client on the LaserWriter 16/600 PS may configure itself to the IP address assigned to another client. This issue is being investigated.

BOOTREQUEST Packet Is Interpreted as DHCPDISCOVER by a DHCP Server

This may be an issue with the BOOTREQUEST sent by the printer. The most likely cause is the DHCP server does not properly conform to RFC 1534. If you do a network trace, check for DHCP option 53 (message type). If the printer's BOOTREQUEST uses option 53, then the printer is out of specification.

Apple Internet Connection Kit and Static IP Address (12/95)

Revised: 12/8/95
Security: Everyone

Apple Internet Connection Kit and Static IP Address (12/95)

=====

Article Created: 8 December 1995

TOPIC -----

This article describes the procedure to use a static IP address with the Apple Internet Connection Kit (AICK).

DISCUSSION -----

Step 1

Configure the dialer to use your Internet Service Provider (ISP) with the define/modify provider menu command, then close the dialer WITHOUT dialing and connecting.

Step 2

If your Macintosh is running TCP/IP, open the TCP/IP control panel, select the Advanced command in the User Mode menu, then fill in the requisite information. Close the control panel.

Step 3

Open the dialer and connect to the ISP. The changes to the TCP/IP control panel will stay, as they are written to a part of the TCP prefs that the dialer does not overwrite.

Things to Avoid

Never have the MacTCP or TCP/IP control panel and the dialer open at the same time. Never have ConfigPPP and the dialer open at the same time.

Either of these combinations of operations will cause system and preferences corruption. Make sure you have quit one process before starting the next.

QuickTime Conferencing: H.320 ISDN NuBus Card Read Me (2/96)

Revised: 2/15/96
Security: Everyone

QuickTime Conferencing: H.320 ISDN NuBus Card Read Me (2/96)

Article Created: 8 December 1995
Article Reviewed/Updated: 14 February 1996

TOPIC -----

This article contains the ReadMe file for the QuickTime Conferencing H.320 ISDN Nubus Card.

DISCUSSION -----

QuickTime Conferencing H.320/ISDN NuBus Card

H.320/ISDN Software

This interface software delivers full H.320/ISDN support to QuickTime Conferencing via a dedicated NuBus expansion bus card installed in a Power Macintosh 7100AV series or 8100AV series computer. This provides compatibility and interoperability with the worldwide ISDN network of videoconferencing centers and video-phones.

System Requirements

-
- Power Macintosh 7100AV series, 8100AV series computers, or 7100 series and 8100 series with AV card upgrade
 - System software version 7.5 or newer
 - 16 megabytes of DRAM (memory)
 - PlainTalk Microphone
 - Network ISDN connection
 - Handset

IMPORTANT NOTE: Some of Apple's newest computers utilize the PCI Expansion Bus and are not compatible with NuBus Expansion Bus cards.

Installing H.320/ISDN Software and Related Software

=====

- Install Macintosh System software, version 7.5 (or newer) or J-7.5.
- Install Network Software Installer, version 1.5 or newer.
- Install QuickTime Conferencing software.
- Install H.320/ISDN software.

Getting Help and Information

=====

The Apple Media Conference program includes the Apple Media Conference Guide, an Apple Guide help system that answers common questions about setting up and using Apple Media Conference. When you first open Apple Media Conference, you can also open Apple Media Conference Guide by clicking the Guide (question mark) button in the startup dialog. You can also choose Apple Media Conference Guide from the Guide menu at any time while you are using Apple Media Conference.

For detailed troubleshooting information, and tips on improving the performance of Apple Media Conference, refer to the Troubleshooting topic in Apple Media Conference Guide.

Troubleshooting

=====

- Local Macintosh sounds are disabled while in hands-free mode

When Hands-Free mode is selected, only audio from the remote connection is played. The Macintosh will not be able to play any local sounds or system beeps or sounds unless you switch to Handset mode or end the call.

- Audio is distorted when in hands-free mode

The H.320/ISDN card is optimized to process 22 kHz audio information. Verify that the sound output rate in the sound control panel is set to 22 kHz.

- Cannot hear audio when broadcasting

If other users cannot hear audio from your machine, open the Sound Settings dialog box and verify that Built-in is selected as your sound source device.

- Handset sound gain will not adjust with slider control

The sound gain control slider located in the Self View Window will only adjust the volume level of the computer's internal or external speakers. It has no affect on the handset sound gain.

- Making a LAN (Local Area Network) connection with PowerTalk and H.320

Although you are able to make a LAN connection through PowerTalk when the connection type selected is H.320 (for Wide Area Networks) it is highly recommended you switch your connection type from H.320 to MovieTalk Protocol before you attempt a LAN connection. Placing a LAN call when the connection type selected is H.320 may cause memory allocation problems with your computer. To change your connection type from H.320 to MovieTalk Protocol choose Preferences/Conference from the Settings menu and set "Connection type:" to MovieTalk Protocol.

- Formatting a floppy disk during a conference connection

Formatting a floppy disk will disconnect you from your conference connection. Do not format floppy disks during a conference connection.

- PowerTalk Catalog Browser with TCP/IP and H.320

The PowerTalk Catalog Browser does not operate in TCP/IP and H.320 environments. To place calls to TCP/IP and H.320 users through PowerTalk you must create business cards for those users. For assistance in creating PowerTalk business cards refer to the Using PowerTalk topic in Apple Media Conference Guide. Read the Getting Help and Information section of this document for information on Apple Media Conference Guide. To bypass PowerTalk hold down the option key when you choose Call from the File menu. You will then be presented with a dialog box for entering the information needed to place your TCP/IP or H.320 call.

- Turning off sound during a conference connection

If you turn off the sound in the Media Setup dialog box you may get a dialog box stating there has been an unexpected error System Error: -223. Click the button located in the dialog box to continue. The error will not affect your computer or your conference connection.

- Installing H.320 software and folder names

When you installed the QuickTime Conferencing software on your hard drive a folder named "QuickTime Conferencing" was created and several items were placed within it. If the name of this folder is changed before you install the H.320 software the H.320 software installer will place the Apple Media Conference Guide document in a new folder named "QuickTime Conferencing." Before you install the H.320 software make sure the name of the folder created by the QuickTime Conferencing software installer is "QuickTime Conferencing."

- Sound compression and ISDN, 1 channel connections

It is not recommended to select the Best Quality (G.722) compressor if you have selected ISDN, 1 channel or ISDN, 1 channel, 56k adaptation. The reduced

bandwidth capacity of ISDN, 1 channel may not have the ability to operate with Best Quality sound compression. Select the Best Efficiency (G.728) compressor if only one ISDN channel is available.

- H.320 software and Macintosh computers equipped with the PCI expansion bus

Some of the newest Macintosh computers have replaced the NuBus expansion bus with a faster expansion bus named PCI (Peripheral Component Interconnect). The H.320 software should not be installed on these computers. Installing the H.320 software may cause these computers to crash during boot up. Booting the computer while holding down the shift key and removing the "~H.320 Extension" file from the Extensions folder in the System Folder will allow the computer to boot properly.

- Typing below the bottom of the Shared Window in Apple Media Conference

When the bottom of the Shared Window is at or below the bottom of the screen do not type text below the bottom-visible edge of the Shared Window. Text which falls below the bottom-visible edge of the Shared Window may be lost.

- Record button appears in Self View window when connection type selected is H.320

Record does not operate when the connection type selected is H.320. If the sound source has been manually changed from "H.320 Card" to "Built-in" the record button will appear in the Self View window but will not operate. Changing the sound source back to "H.320 Card" will remove the record button.

- Error when disconnecting video or audio cables during a connection

Avoid 'hot plugging' video and audio cables while you have an active connection. This can temporarily confuse the QuickTime software and display error messages.

- Inconsistent behavior when using WindowShade product

Do not use the Windowshade option to hide windows in the Apple Media Conference application. The software may not realize that the window has been hidden and display error messages.

- Increasing memory allocated for the Apple Media Conference application

The system is optimized for ISDN connections and small LAN connections. If you receive low-memory warnings in Apple Media Conferencing you should increase the amount of memory allocated for the Apple Media Conferencing application. To do this, click once on the Apple Media Conferencing icon, choose the Get Info command from the File menu, and increase the value in the Preferred Size box.

- Calling TCP/IP users who use dynamic server-based addresses

If you are connecting using TCP/IP from a machine using a static IP address to a machine using MacIP (KIP) server supplied addresses, you must have a clear TCP/IP pathway between the Mac with the static address and the MacIP (KIP) server.

If you plan to use a MacIP server to allocate TCP/IP addresses, the MacIP requires a clear AppleTalk pathway from all Macs requiring an IP address to the MacIP server.

- Video image is distorted

Check that the Apple Media Conference software is configured for the video format supplied by your camera (NTSC, PAL, or SECAM). To change this setting, choose "Video Settings" from the "Settings" menu, switch to the page marked "Source", and select the video format from the "Format" pop-up menu.

- Audio and Video freezes when pasting images during a 1B connection

With a 1B channel connection (56K/64K), outgoing video and audio may stop during a shared window transfer. To restart video and audio, wait for the shared window transfer to complete, open up media settings, disable video and audio, press OK, then open up media settings again and re-enable video and audio.

- Pausing self-view window temporarily disables incoming video

If you pause the outgoing video and audio from your machine, your remote window may temporarily freeze. To recover from this problem, simply click anywhere inside the remote window and the video from the remote site will resume.

Article Change History:

14 Feb 1996 - Added additional troubleshooting steps.

QuickTime Conferencing: H.320 ISDN NuBus Card Troubleshoot 2/96

Revised: 2/14/96
Security: Everyone

QuickTime Conferencing: H.320 ISDN NuBus Card Troubleshoot 2/96

Article Created: 8 December 1995
Article Reviewed/Updated: 14 February 1996

TOPIC -----

This article contains common troubleshooting information taken from the Read Me for the QuickTime Conferencing software included with the H.320/ISDN Card.

DISCUSSION -----

- Local Macintosh computer sounds are disabled while in hands-free mode

When Hands-Free mode is selected, only audio from the remote connection is played. The computer will not be able to play any local sounds or system beeps or sounds unless you switch to Handset mode or end the call.

- Audio is distorted when in hands-free mode

The H.320/ISDN card is optimized to process 22 kHz audio information. Verify that the sound output rate in the sound control panel is set to 22 kHz.

- Cannot hear audio when broadcasting

If other users watching your broadcast cannot hear audio from your machine, open the Sound Settings dialog box and verify that Built-in is selected as your sound source device.

- Handset sound gain will not adjust with slider control

The sound gain control slider located in the Self View Window will only adjust the volume level of the computer's internal or external speakers. It has no affect on the handset sound gain.

- Making a LAN (Local Area Network) connection with PowerTalk and H.320

Although you are able to make a LAN connection through PowerTalk when the connection type selected is H.320 (for Wide Area Networks) it is highly recommended you switch your connection type from H.320 to MovieTalk Protocol before you attempt a LAN connection. Placing a LAN call when the connection type selected is H.320 may cause memory allocation problems with your computer. To change your connection type from H.320 to MovieTalk Protocol choose Preferences/Conference from the Settings menu and set "Connection type:" to MovieTalk Protocol.

Before you install the H.320 software make sure the name of the folder created by the QuickTime Conferencing software installer is "QuickTime Conferencing."

- Sound compression and ISDN, 1 channel connections

It is not recommended to select the Best Quality (G.722) compressor if you have

selected ISDN, 1 channel or ISDN, 1 channel, 56k adaptation. The reduced bandwidth capacity of ISDN, 1 channel may not have the ability to operate with Best Quality sound compression. Select the Best Efficiency (G.728) compressor if only one ISDN channel is available.

- H.320 software and Macintosh computers equipped with the PCI expansion bus

Some of the newest Macintosh computers have replaced the NuBus expansion bus with a faster expansion bus named PCI (Peripheral Component Interconnect). The H.320 software should not be installed on these computers. Installing the H.320 software may cause these computers to crash during boot up. Starting up the computer while holding down the shift key and removing the "~H.320 Extension" file from the Extensions folder in the System Folder will allow the computer to boot properly.

- Typing below the bottom of the Shared Window in Apple Media Conference

When the bottom of the Shared Window is at or below the bottom of the screen do not type text below the bottom-visible edge of the Shared Window. Text which falls below the bottom-visible edge of the Shared Window may be lost.

- Record button appears in Self View window when connection type selected is H.320

Record does not operate when the connection type selected is H.320. If the sound source has been manually changed from "H.320 Card" to "Built-in" the record button will appear in the Self View window but will not operate. Changing the sound source back to "H.320 Card" will remove the record button.

- Error when disconnecting video or audio cables during a connection

Avoid 'hot plugging' video and audio cables while you have an active connection. This can temporarily confuse the QuickTime software and display error messages.

- Inconsistent behavior when using WindowShade product

Do not use the Windowshade option to hide windows in the Apple Media Conference application. The software may not realize that the window has been hidden and display error messages.

- Increasing memory allocated for the Apple Media Conference application

The system is optimized for ISDN connections and small LAN connections. If you receive low-memory warnings in Apple Media Conferencing you should increase the amount of memory allocated for the Apple Media Conferencing application. To do this, click once on the Apple Media Conferencing icon, choose the Get Info

command from the File menu, and increase the value in the Preferred Size box.

- Calling TCP/IP users who use dynamic server-based addresses

If you are connecting using TCP/IP from a machine using a static IP address to a machine using MacIP (KIP) server supplied addresses, you must have a clear TCP/IP pathway between the Mac with the static address and the MacIP (KIP) server.

If you plan to use a MacIP server to allocate TCP/IP addresses, the MacIP requires a clear AppleTalk pathway from all Macs requiring an IP address to the MacIP server.

- Video image is distorted

Check that the Apple Media Conference software is configured for the video format supplied by your camera (NTSC, PAL, or SECAM). To change this setting, choose "Video Settings" from the "Settings" menu, switch to the page marked "Source", and select the video format from the "Format" pop-up menu.

- Audio and Video freezes when pasting images during a 1B connection

With a 1B channel connection (56K/64K), outgoing video and audio may stop during a shared window transfer. To restart video and audio, wait for the shared window transfer to complete, open up media settings, disable video and audio, press OK, then open up media settings again and re-enable video and audio.

- Pausing self-view window temporarily disables incoming video

If you pause the outgoing video and audio from your machine, your remote window may temporarily freeze. To recover from this problem, simply click anywhere inside the remote window and the video from the remote site will resume.

QuickTime Conferencing: Troubleshooting (12/95)

Revised: 12/8/95
Security: Everyone

QuickTime Conferencing: Troubleshooting (12/95)

=====

Article Created: 8 December 1995

TOPIC -----

This article contains common troubleshooting information taken from the Read Me file which is included with the QuickTime Conferencing software.

DISCUSSION -----

Apple Media Conference Guide contains more detailed information about the problems listed here, and other problems you may encounter.

- You see low memory warnings while using Apple Media Conference

Increase the amount of memory allocated for the Apple Media Conference program. To do this, quit Apple Media Conference, go to the Finder, click the Apple Media Conference program icon, choose Get Info from the File menu, and increase the value in the Preferred Size box. For more detailed instructions on increasing the memory allocated to a program, go to the Finder, open the Guide menu located in the upper-right-corner of your screen, choose Macintosh Guide, click the Topics button, click the Memory topic area, and double-click the "change a program's memory size" phrase.

- You see an error message when you plug or unplug video or audio cables during a connection

Do not plug or unplug camera, microphone, or other sound and video cables while you are connected to another caller, or viewing or sending a broadcast. This can temporarily disable the QuickTime software. You should always turn off your computer before you plug or unplug any cables.

- The video image is distorted

Make sure the settings are correct in the Video Settings dialog box. The

settings should specify the video format supplied by your camera (NTSC, PAL, or SECAM). To adjust the settings, choose Video Settings from the Settings menu, choose Source from the top pop-up menu in the Video Settings dialog box, and choose the correct video format (NTSC, PAL, or SECAM) from the Format pop-up menu.

Apple Media Conference Guide contains more detailed instructions on adjusting the video (and sound) settings.

If you are using a Power Macintosh 6100AV, 7100AV, or 8100AV computer, attach your display to the monitor port located on the AV video card instead of the monitor port located on the computer's logic board. (Shut down the computer and turn off the power before you change your display's connection.) See the manual that came with your computer for more information.

- Calling TCP/IP Users with Dynamic Server-Based Addresses

If you are connecting using TCP/IP from a machine using a static IP address to a machine using MacIP (KIP) server supplied addresses, you must have a clear TCP/IP pathway between the Macintosh computer with the static address and the MacIP (KIP) server.

If you plan to use a MacIP server to allocate TCP/IP addresses, the MacIP requires a clear AppleTalk pathway from all Macintosh computers requiring an IP address to the MacIP server.

- A Note Regarding Interoperability

QuickTime Conferencing is the foundation for a broad range of Apple and third-party video and document conferencing solutions.

QuickTime Conferencing supports open standards for interoperability, so developers can use it to create software that works with a variety of network transports, compression technologies, and media devices (cameras, microphones, and so forth). QuickTime Conferencing provides consistent standards that encourage software developers to create application programs that look and act the same from a user's point of view, regardless of the computer, network service, or devices being used.

For Power Macintosh 5200 LC and 5300 LC Users

Users of the Power Macintosh 5200 LC and 5300 LC series computers should note the following:

- Sound compression and sound sample rate

Sound compression is not available if the selected sound sample rate is 11.127 kHz. Sound compression is available if the selected sound sample rate is 22.255 kHz. The sound compression and sound sample rate settings are found in Sound

Settings under the Settings menu. For example, if the sound sample rate is set to 22.225 kHz and you wish to change it to 11.127 kHz you must make sure the sound compression is set to "None" or you will not be able to select 11.127 kHz.

- Large window sizes and low memory problems

You may encounter memory problems when using double size windows for the self view and remote view. Increasing the amount of application memory for Apple Media Conference from 3,000 kbytes to 4,000 kbytes will solve this problem. A description of changing the amount of memory for Apple Media Conference is described below in the Troubleshooting section of this document.

- PPCPlayThru extension conflict

If the PPCPlayThru extension is present in the Extensions folder of the System Folder the volume control in Apple Media Conference will not operate properly. Removing the PPCPlayThru extension will correct the problem.

- For At Ease 3.0 and At Ease Workgroups 2.0.3 Users

For QuickTime Conferencing to operate properly certain conditions under At Ease must be set properly.

- If the user is restricted to At Ease Panels, Apple Media Conference and MediaPlayer must be enabled under "Items for this User."

- File open and save privileges must be enabled under the "Security" setup. Both the user's folder and/or floppy should be set for these privileges. The user should also be allowed to perform screen captures.

- Apple Media Conference will not save preference settings based on individual users. Each individual user should check to make sure the settings are appropriate for their conferencing needs. To change the name of the user in Apple Media Conference choose Preferences/Conference from the Settings menu. Type your name in the user name box.

- Drag and Drop onto the desktop does not operate in the At Ease Panels level.

- You cannot share movies or sounds in the Shared Window in Apple Media Conference.

Apple LaserWriter: Printing From UNIX (1/96)

Revised: 1/4/96
Security: Everyone

Apple LaserWriter: Printing From UNIX (1/96)

Article Created: 8 December 1995
Article Reviewed/Updated: 4 January 1996

TOPIC -----

This article provides guidelines for printing from a UNIX workstation to an Apple LaserWriter printer over a serial connection.

DISCUSSION -----

Step 1: Create PostScript Files

If the applications you are using do not generate PostScript files, or if you want to print plain text files, you need a tool to translate plain text into PostScript. TranScript is one such application from Adobe Systems, Inc., which does this. The TranScript software converts non-PostScript language files such as Tek 4014, Diablo 630, troff, ntroff, plot and ASCII into PostScript language files. TransScript is distributed by the Qualix Group.

Step 2: Create a Printer Description

Once you have text to PostScript software installed, set up an entry in the /etc/printcap file for the PostScript printer. Sample printcap entries can be found on the internet. One anonymous ftp site is "ftp.unt.edu" which contains the file printcap-city located in the /pub/unix directory. The entry should look similar to:

Begin_Table

```
#LASERWRITER PLUS (GENERIC) -----
lp|lw|ps|PostScript|LaserWriter|laserwriter|postscript|Apple:\
    :lp=/dev/lw:br#9600:\
    :fc#0000374:fs#0000003:xc#0:xs#0040040:rw:\
    :if=/usr/lib/psif:of=/usr/doctools/lib/psof:\
    :gf=/usr/lib/psgf:nf=/usr/doctools/lib/psnf:\
    :tf=/usr/lib/pstf:\
```

```
:vf=/usr/lib/psvf:\n:sd=/usr/spool/lpd0:lf=/usr/spool/lpd0/log:\n:mx#0:sf:sb:
```

End_Table

Step 3: Make Connection

Connect the printer to the workstation. Adjust printer and port communications settings appropriately.

Step 4: Check the Connection

• Send data to the printer using the commands your UNIX workstation requires. Here is a generic example, you may need to use a different command. This command does not print anything, it only checks the connection.

```
echo "Hello" > /dev/port &
```

After sending the command you should see the lights on the printer flash as the data is received. If you do not see the lights flash, there may a problem with the physical connection. You should check the cable, UNIX system serial port setup, or LaserWriter setup.

Step 5: Printing a PostScript File

• The final step is to print a PostScript file. If you have a PostScript file available, you should be able to print it with the following command:

```
cat filename > /dev/port &
```

ARA 2.0.1 Client: LanRover/E or NetModem/E Issue (12/95)

Revised: 12/8/95
Security: Everyone

ARA 2.0.1 Client: LanRover/E or NetModem/E Issue (12/95)

=====

Article Created: 5 December 1995

TOPIC -----

I cannot connect to my LanRover/E v3.x or NetModem/E 3.5 using Apple Remote Access (ARA) v 2.0.1. Apple Remote Access v 2.0 connects fine. Do I need a special CCL file?

DISCUSSION -----

AppleTalk Remote Access 2.0.1 added a feature which lets remote Macintosh clients connect to ARA 1.0 and ARA 2.0 servers without setting the "ARA 1.0 compatibility" checkbox in the options window. The ARA 2.0.1 client identifies the type of server by sending two different link request packets, one for 2.0.x and one for 1.0, then decides the version by the server's response.

Because an ARA 1.0 link request packet is exactly the same as an error correction request packet, the modem on the Shiva Remote Access Server will reply positively to the ARA 1.0 link request. The client, seeing the positive reply, decides the server is set up for ARA 1.0 and begins to make an ARA 1.0 connection. Since the Shiva device is looking for an ARA 2.0 connection, the connection will fail.

Shiva is aware of this issue. Please contact Shiva's technical support staff for further assistance.

MessagePad 120: Hardware Handshake Isn't on PC Cables (12/95)

Revised: 12/11/95
Security: Everyone

MessagePad 120: Hardware Handshake Isn't on PC Cables (12/95)

=====

Article Created: 11 December 1995

TOPIC -----

Is the PC compatible cable that shipped with the Apple MessagePad 120 2.0 devices a hardware handshaking cable? Is hardware handshaking required?

DISCUSSION -----

The PC to Apple MessagePad cable is not a hardware handshake cable. There is no need for it to be since both the MessagePad and the PC are capable of handling communication at 57,600 baud. At this data rate, there should not be any data overflow.

The above situation is slightly different than modem communications where the modem speed is slower than the serial port speed. For example, if the port is set for 57,600 baud and the modem is communicating at 28,800, the modem has to be able to compress the data 2:1 to stay up with the computer. If the data cannot be compressed this much, the modem must tell the computer to stop sending the data to prevent overflow. This is why you must use a cable that supports hardware handshaking.

LaserWriter 16/600 PS: Lantastic Spooler Issues (12/95)

Revised: 12/11/95
Security: Everyone

LaserWriter 16/600 PS: Lantastic Spooler Issues (12/95)

=====

Article Created: 11 December 1995

TOPIC -----

I am having some difficulties with my LaserWriter 16/600 PS printer, which is connected to a MS-DOS Lantastic Server. When printing PCL (LaserJet emulation), the graphic information does not print, and the job either takes a long time to print, or does not print until a job is spooled.

DISCUSSION -----

When the Lantastic spooler gets corrupted, graphic information does not get sent to the printer. You need to contact Artisoft to get instructions on how to regenerate the spooler.

The LaserWriter 16/600 PS printer requires a CTRL-D at the end of a print job to flush the buffer and cause the job to print. The CTRL-D is not being placed at the ends of your print jobs, this is why it sometimes takes two tries to print. You can manually flush the printer but pressing the combination of CTRL-ALT-PRTSN keys.

AppleVision 1710AV Display: Timing, Sync & Pixel Freqs (12/95)

Revised: 12/11/95
Security: Everyone

AppleVision 1710AV Display: Timing, Sync & Pixel Freqs (12/95)

=====

Article Created: 11 December 1995

TOPIC -----

I have a completely configurarble video card for a workstation that I want to use with the AppleVision 1710AV Display. However, I need some additional parameters for the video card. I need: sync frequencies, pixel frequencies, and timing information.

DISCUSSION -----

Here are the parameters you need.

Begin_Table

Mode	13-in. Color	16-in. Color	19-in. RGB	21" Color Two-Page	Units
Resolutions					
Hactive	640	832	1024	1152	pixels
Vactive	480	624	768	870	lines
Sync Frequencies					
Fhonzontal	34.97	49.70	60.24	68.70	kHz
Fvertical	66.67	74.55	74.93	75.00	Hz
Sync polarity	negative	negative	negative	negative	
Pixel Frequencies					

+=====+						
Pixel Rate	30.24	57.28	80	100.0	MHz	
+=====+						
Timing						
Information						
+=====+						
HSync Delay	64	32	32	32	pixels	
HSync Width	64	64	96	128	pixels	
HBlank	224	320	304	304	pixels	
VSync Delay	3	2	3	3	lines	
VSync Width	3	3	3	3	lines	
VBlanking	45	43	36	45	lines	
+=====+						

End_Table

NOTE:

Apple reserves the right to change these specifications without notification at any time, and will not guarantee that this will address all of the issues that may be involved with configuring this video card.

QuickDraw 3D: Out of Memory Errors (12/95)

Revised: 12/11/95
Security: Everyone

QuickDraw 3D: Out of Memory Errors (12/95)

Article Created: 11 December 1995

TOPIC -----

Each time I attempt to open a QuickDraw 3D document I get an error message saying that there is not enough memory. However, based on the memory requirements for the application and the amount of memory being used by the system software, I should have enough memory available. What could be causing this error?

DISCUSSION -----

QuickDraw 3D is a shared library, which is a code fragment that can be used by any application. Because shared libraries can be used by different applications, they are loaded into the system heap. The result is that you need enough memory to open the application and to adjust for this increase in memory used by the system software. QuickDraw 3D requires a minimum of 16 MB of RAM.

Depending on the size of the document, the active system software heap may grow substantially in size. To prevent this error message, try reducing the preferred size of the application to the suggested size, or try reducing the size of the system software by turning off unused extensions and control panels using the Extensions Manager control panel.

Some applications which use shared libraries can get around this memory requirement by using virtual memory. However, using virtual memory with QuickDraw 3D is not recommended or supported; virtual memory will considerably decrease the performance of QuickDraw 3D.

Color StyleWriter 2400: Prints Only Graphics, No Text (12/95)

Revised: 12/11/95
Security: Everyone

Color StyleWriter 2400: Prints Only Graphics, No Text (12/95)

=====

Article Created: 11 December 1995

TOPIC -----

I have a Color StyleWriter 2400 printer and I can print graphics, but I cannot print text. If I go into SimpleText and try to print, the printer goes through the motions but nothing prints out. I can perform a Self Test on the Printer, and in Finder, use the Print Window option, and the Color StyleWriter 2400 prints. I reinstalled the Mac OS following clean install instructions I received, but that did not help.

DISCUSSION -----

There are two cartridges for the Color StyleWriter 2400, a color cartridge and a black cartridge. If you are using the color cartridge and run out of black ink, you will be able to print color graphics and the icons, but the text will not be printed since there is not any ink left in the black ink cartridge. The easiest way to verify that you are out of black ink is to perform a self-test. If the Color StyleWriter 2400 prints a picture of the printer, but does not have the text for the printer's name then you know that you are out of black ink.

Newton 2.0 OS: Trouble Beaming to 1.3 OS Device (12/95)

Revised: 12/11/95
Security: Everyone

Newton 2.0 OS: Trouble Beaming to 1.3 OS Device (12/95)

=====

Article Created: 11 December 1995

TOPIC -----

When attempting to Beam My Card (an option in the Routing button of the Names application), the MessagePad being beamed to presents a -48006 error if the MessagePad is using Newton 1.3 OS.

DISCUSSION -----

This is something that Apple is currently investigating. Here is a workaround, so you can beam cards between Newton 2.0 and 1.3 OS devices.

Step 1

On the Newton 2.0 OS device, open the Extras drawer and tap on Owner Info.

Step 2

Check the owner.

Step 3

Tap on the routing button, and then tap on "Beam". DO NOT tap on "Beam My Card."

Step 4

On the Newton 1.3 OS device, open the Extras drawer, and tap on "In Box".

Step 5

Tap the Receive button, then tap on "Beam".

Drive Setup 1.0.3: May Report Incorrect Version (1/96)

=====

Article Created: 8 December 1995
Article Reviewed/Updated: 2 January 1996

TOPIC -----

This article describes an incorrect version number being reported when using Drive Setup 1.0.3.

DISCUSSION -----

The Drive Setup 1.0.3 software that ships with the PowerBook 2300c, and may be included in other systems with IDE disk drives, may show an incorrect version number of "1.12e3" in the Get Info window of the IDE disk drive. This incorrect version number was inadvertently left in the final version of Drive Setup 1.0.3 which has no affect on the software's functionality.

CLW 12/600 PS: Windows 95 Problems w/ vecpd.386 (2/97)

Revised: 2/27/97
Security: Everyone

CLW 12/600 PS: Windows 95 Problems w/ vecpd.386 (2/97)

=====

Article Created: 11 December 1995
Article Reviewed/Updated: 27 February 1997

TOPIC -----

I have installed Windows 95 on my PC-compatible, and I am having some trouble printing to the Color LaserWriter 12/600 PS printer. I was able to print using Windows 3.11.

DISCUSSION -----

The Color LaserWriter 12/600 PS printer software for Windows 3.1x installs VECPD.386, a bidirectional parallel port driver that was not intended for Windows 95. If you upgrade to Windows 95, or install the Windows 3.1 printer software after installing Windows 95 the VECPD.386 file is installed. This file prevents the computer from being able to access the printer port properly. To prevent VECPD.386 from loading, remove the following line from the [386 enh] section of SYSTEM.INI and restart your computer:

```
device=vecpd.386
```

System 7.5: AppleScript Automated Tasks Time Out Error (12/95)

Revised: 12/11/95
Security: Everyone

System 7.5: AppleScript Automated Tasks Time Out Error (12/95)

Article Created: 11 December 1995

TOPIC -----

I am trying to run several of the Automated Tasks included with System 7.5. Each task seems to start up fine, but after a minute or two an error appears that says "Apple Event Timed Out" with the option to Edit or Quit.

If I click on the Edit option I see lots of strange codes such as <<class fshr>> and <<class fsup>>. I have done some AppleScript programming and have opened the automated task scripts before but I have never seen these commands.

AppleScript is turned on in the Extensions Manager and other scripts that I have written run fine.

DISCUSSION -----

You are getting this time out error because the Finder Scripting Extension is either turned off in the Extensions Manager or some part of AppleScript is corrupted.

Open the Extensions Manager control panel and make sure that the Finder Scripting Extension has a checkmark next to it. If it is already on, reinstall AppleScript from your original system software disks or CD-ROM disc.

The strange codes you see are AppleScript commands that were written when the Finder Scripting Extension was loaded. When the Finder Scripting Extension is not loaded, the commands lose the natural language format you saw before causing these class formatting commands to appear instead.

The scripts you wrote earlier work because they do not access the Finder Scripting Extension.

ImageWriter II & DOS Compatible Card: Condensed Print (1/96)

Revised: 1/3/96
Security: Everyone

ImageWriter II & DOS Compatible Card: Condensed Print (1/96)

Article Created: 12 December 1995
Article Reviewed/Updated: 3 January 1996

TOPIC -----

When I'm in the DOS environment on my DOS Compatible computer, and I print to the attached ImageWriter II as shown in the Read Me file, the printer prints in ultra-condensed mode with very thin characters. Why is this happening, and is there a workaround?

DISCUSSION -----

When printing from the DOS Compatibility Card, the information gets sent to the PC Print Spooler application on your Macintosh, and then on to the printer selected in Chooser. This condensed output occurs because of the way the ImageWriter II interprets the information it receives from the PC Print Spooler.

Workaround =====

Step 1 -----

In the PC Setup control panel, set COM1: to be the port where the printer is connected. This bypasses the PC Print Spooler and Chooser, and sends the data directly to the port you selected.

Step 2 (FOR MS-DOS ONLY) -----

Type the following at the command line:

```
MODE LPT1: = COM1:
```

Step 2 (FOR WINDOWS ONLY) -----

Go to the Printers control panel and set Epson LQ-2500 to COM1: instead of LPT1:

port.

IMPORTANT:

This workaround prevents you from printing in the Macintosh environment. In order to print from the Macintosh environment, you must go back to the PC Setup control panel and change COM1 back to None.

AppleVision 1710AV Display: Shortened Startup Tone (2/97)

Revised: 2/5/97
Security: Everyone

AppleVision 1710AV Display: Shortened Startup Tone (2/97)

Article Created: 12 December 1995
Article Reviewed/Updated: 5 February 1997

TOPIC -----

I have an AppleVision 1710AV Display connected to my Macintosh computer. When I startup my computer, I sometimes only hear part of the startup tone. If I disconnect the audio cable from the computer to the display, I hear the entire tone. Is there something I can do to hear the complete tone?

DISCUSSION -----

When the Macintosh audio is connected to the AppleVision 1710AV Display, there is nothing you can do, that will allow you to always hear the complete startup tone. Because of the additional features in the AppleVision 1710AV Display, there is a slight delay in power reaching all the components. Depending on how quickly the speakers in the monitor are able to power up, you may hear a partial startup tone, no startup tone, or the entire startup tone.

There is nothing wrong with your monitor or your computer. If you want to hear the startup chime, unplug the sound out cable that connects from your computer to the AppleVision 1710AV Display. Once this cable is removed, you hear the chime from the built-in speaker of your computer. Until you reconnect the sound cable, all sound goes through the internal computer speaker.

Article Change History:
05 Feb 1997 - Added paragraph about disconnecting sound cable.

Newton 2.0 OS: How to Move All Application Data (12/95)

Revised: 12/12/95
Security: Everyone

Newton 2.0 OS: How to Move All Application Data (12/95)

=====

Article Created: 12 December 1995

TOPIC -----

Is there a way to move all of the data, for instance my Names, from a PC-card to the internal memory, or to a particular folder?

DISCUSSION -----

Yes you can move the data. Here are the steps you need:

Note:

This procedure moves all of the data. Do Not use this procedure if you only want to move some of the data.

Step 1

Open the Extras Drawer

Step 2

Choose the Storage folder. Do this by tapping on the folder tab.

Step 3

Tap on the Names icon.

Step 4

Tap on the folder button.

A slip appears with several options. You can file all of your names data in the internal memory or on a PC-card. In either location, you can store this data in a folder of your choice. This feature is supported on all of the built-in application's data, with the exception of Time Zones.

To move only certain names, refer to the topic "Filing multiple items and cards" in the "Organizing and Finding Information" section of the Apple MessagePad Handbook.

Macintosh 5200 & 5300 Computers: Rattling Noise (12/95)

Revised: 12/14/95
Security: Everyone

Macintosh 5200 & 5300 Computers: Rattling Noise (12/95)

=====

Article Created: 14 December 1995

TOPIC -----

Recently my Macintosh Performa 5200 has started making a continuous rattling sound at startup. What could be causing this?

DISCUSSION -----

You likely have the Apple External Video Connector (M4099LL/A) installed in your computer. The ribbon cable of this connector can sometimes rise up and contact the exposed blades of the fan assembly, which causes this noise.

To resolve this issue, press the ribbon cable down flat, or (if the cable is long enough), fold it as recommended in the External Video Connector User's Guide.

Note that this symptom can occur in any of the following computers:

- Power Macintosh 5200/75 LC
- Power Macintosh 5300/100 LC
- Macintosh Performa 5200 series
- Macintosh Performa 5300 series

Color StyleWriter Pro: Using Non-Apple Ink Cartridges (12/95)

Revised: 12/14/95
Security: Everyone

Color StyleWriter Pro: Using Non-Apple Ink Cartridges (12/95)

=====

Article Created: 14 December 1995

TOPIC -----

This article contains information on using Non-Apple labeled ink cartridges in the Apple Color StyleWriter Pro printer.

DISCUSSION -----

Apple Service and Support has received some warranty claims for Color StyleWriter Pro printers which were not functioning correctly. Apple's analysis of these printers indicate that they were damaged due to ink spraying onto the printhead circuit and causing it to short. Further analysis indicates this was caused by customers using ink cartridges in their printer which have a vent hole design that causes the ink to spray downward onto the printhead circuit.

Apple's current Color StyleWriter Pro Ink Cartridges are designed to prevent this from occurring; however, there are other non-OEM vendors selling replacement cartridges which use this design. To avoid possible damage to the printer, Apple recommends only using Apple-brand replacement ink cartridges with the Color StyleWriter Pro printer.

CD-ROM Setup 5.1.2: Multisessions Create Multiple Icons (8/96)

Revised: 8/19/96
Security: Everyone

CD-ROM Setup 5.1.2: Multisessions Create Multiple Icons (8/96)

=====
Article Created: 14 December 1995
Article Reviewed/Updated: 19 August 1996

TOPIC -----

I am using CD-ROM Setup 5.1.2 on my Macintosh, with a Kodak CD Writer. I am creating multisession CD-ROM discs, and I just started using CD-ROM Setup 5.1.2. Previously, the disc displayed on the Macintosh desktop as a single icon. Now with CD-ROM Setup 5.1.2 installed, multiple icons for the disc appear on my desktop. The number of icons that appear are equivalent to number of sessions I placed on the CD-ROM Disc.

DISCUSSION -----

This is the normal behavior of multisession CD-ROM Discs. Multisession CD-R discs appear as multiple volumes on the Macintosh desktop. If you change the name of the session when you create a new partition, it has a different name on the desktop.

System 7.x: Avoiding Memory Fragmentation (12/95)

Revised: 12/14/95
Security: Everyone

System 7.x: Avoiding Memory Fragmentation (12/95)

Article Created: 14 December 1995

TOPIC -----

Although I have over 20 MB of RAM, I sometimes get messages stating that there is not enough memory. Also, when I quit applications, I notice that the Largest Unused Block in the About This Macintosh window does not increase. Why does this occur, and how can I prevent it?

DISCUSSION -----

Provided the applications and extensions you use are functioning correctly, you are most likely experiencing the effects of memory fragmentation. Memory fragmentation occurs if you don't quit applications and desk accessories in exactly the reverse order in which you launched them.

Memory fragmentation can occur regardless of how much memory you have, but the less memory you have, the sooner you will experience the effects. It is similar to hard disk fragmentation, but files stored on a disk can easily be broken up into fragments if there is not enough contiguous space on the drive. However, programs that are loaded in memory cannot be fragmented and thus need a contiguous area of memory. Your computer may have several unused blocks of memory mixed in with the used blocks of memory, but it can only make the largest unused block available to programs.

To defragment memory, you can do one of the following steps:

Step 1

Quit all open applications and desk accessories and then open them again.

Open applications appear in the Application menu. To quit an application, select it from the Application menu and then choose Quit from the File menu. The Largest Unused Block in About This Macintosh will increase as more contiguous memory is made available, but it won't necessarily increase with each program you quit.

OR

Step 2

Restart your computer.

To avoid fragmentation again, be careful in planning the order in which you open and quit programs:

Step 1

Open first the applications and desk accessories you're least likely to quit.

Step 2

Open last those applications and desk accessories you're most likely to quit during a work session.

By opening and closing applications and desk accessories this way, the memory you free up will be contiguous with the rest of the Largest Unused Block. When you quit programs in random order, you're likely to have fragmented memory.

AppleShare Client for Windows Manual Has Wrong Version (4/96)

Revised: 4/22/96
Security: Everyone

AppleShare Client for Windows Manual Has Wrong Version (4/96)

Article Created: 12 December 1995
Article Reviewed/Updated: 22 April 1996

TOPIC -----

In the "Getting Started with AppleShare Client for Windows" documentation, the version number is 1.0.1. Isn't the version number 1.0.2?

DISCUSSION -----

Yes the version is 1.0.2. In the final moments of finishing AppleShare Client for Windows 1.0.1, a fix was incorporated which changed the version to 1.0.2. Unfortunately, at that point in the process, the manuals were already printed.

The correct version number has been added in these online files:

PROBLEMS.WRI
USERINST.WRI
README.TXT

Also, the disk image files of AppleShare Client for Windows included on the AppleShare 4.2 CD are listed as version 1.0.1 rather than 1.0.2.

A documentation errata was included in the README.TXT file which reads as follows:

Documentation errata

Your documentation may refer to this product as AppleShare Client for Windows version 1.0.1. AppleShare Client for Windows 1.0.2 includes a recently developed change to ensure correct installation on systems running NetWare. This minor improvement is the only difference between the two versions.

Article Change History:
22 Apr 1996 - Added information on the AppleShare 4.2 CD.

Mail*Link Read Me and Open Transport Issue (1/96)

=====

Article Created: 14 December 1995
Article Reviewed/Updated: 4 January 1996

TOPIC -----

The Read Me file for Mail*Link Internet includes the following note:

"OpenTransport users: This gateway does not function correctly when used with Apple's OpenTransport. The gateway will connect one time but will not reconnect without a reboot. Apple is currently investigating the problem."

Has this issue been addressed with Open Transport (1.0.8 or 1.1) or will it require a revision to Mail*Link? Also, when can Mail*Link Internet be expected to work with PCI-based Macintosh computers like the Power Macintosh 7200, 7500, 8500, and 9500?

DISCUSSION -----

This issue will be fixed in Open Transport 1.1 which should be included with the next version of the system software and system software update.

The schedule for updating the gateway has not been determined at this time.

The workaround is to Open the Internet Key on the Key Chain, go to Preferences, go to SMTP/TCP, and click the "Ping before opening connection" checkbox to deselect it. This workaround text has been included in the latest Read Me.

Article Change History:
04 Jan 1996 - Changed fix will be in Open Transport 1.1.
20 Dec 1995 - Made correction.

Macintosh Sound Port: Can I Use 8 ohm Headphones? (12/95)

Revised: 12/15/95
Security: Everyone

Macintosh Sound Port: Can I Use 8 ohm Headphones? (12/95)

=====

Article Created: 15 December 1995

TOPIC -----

Can I safely use 8 ohm headphones with my Power Macintosh 7500 computer?

DISCUSSION -----

Yes, you can use a set of headphones with an impedance rating of 8 ohms on any Macintosh computer with a sound out port.

The lower impedance will not cause any problems for the computer or the headphones. However, the audio heard through the 8 ohm headphones may not be as loud as the audio you would hear through a pair of higher impedance headphones.

At Ease 3.0.1 Updater: Read Me (12/95)

=====

Article Created: 15 December 1995
Article Reviewed/Updated: 20 December 1995

TOPIC -----

This article contains the ReadMe from the At Ease for Workgroups 3.0.1 Updater posted online.

DISCUSSION -----

Important Information about At Ease for Workgroups 3.0.1 Updater

Contents

Requirements for Updating

- Version 3.0 Already Installed
- Workgroup Version of At Ease
- Update Some or All Workstations
- Using an AppleShare Server for At Ease

Updating Procedure

- Installation Options
- Updating from the Floppy Disk
- Updating Over the Network
- Files the Updater Needs to Locate
- Use an Updated Copy of the Administration Program
- New Desktop Printer Extension

Changes in Version 3.0.1

- Launching Applications from Other Applications
- Log-in Procedure
- At Ease Setup Changes

Clarifications

- Using Kid Pix Studio (Correction to Read Me for At Ease 3.0)
- CD-ROMs and At Ease

- Documents Created by Approved Applications
- Server Mounting in At Ease
- Disk Security
- At Ease and File Sharing
- Maximum Number of Connected Users on an At Ease Server
- Bypassing At Ease at Startup on Certain Power Macintoshes
- Incompatible System Extensions or Control Panels
- Users with Multiple Setups

Major Problems Corrected in Version 3.0.1

- Users Visible After Update from Version 2.x
- No Report of Damaged Preferences File at Log-in
- Faster Logging In or Out on Large Systems
- Documents Panel Remains Visible
- Setup Application Correctly Recognizes Setups
- Virex Incompatibility Corrected
- Items in the Apple Menu Remain Visible
- Servers Mount Correctly
- Import Users Function Works Correctly
- Middle Level Administration

The At Ease 3.0.1 Updater will update your current version of At Ease for Workgroups 3.0 to the latest version, 3.0.1. The changes in version 3.0.1 include enhancements for the networking environment and bug fixes. A detailed list of changes appears at the end of this document.

Requirements for Updating

=====

Version 3.0 Already Installed

You can only use the Updater application on a workstation that has version 3.0 installed. The Updater will not run if you have an older version (2.x or a lower number) installed. If you have an earlier version of At Ease for Workgroups, you should first update it to version 3.0, then use the Updater.

Workgroup Version of At Ease

Any workstation you update with the Updater must have At Ease for Workgroups installed. You should not use this Updater to update a workstation that has the non-workgroup version of At Ease installed. The updated software has not been tested with the non-workgroup version, and most changes in version 3.0.1 involve network enhancements that will not be used in the non-workgroup version.

In addition, the Updater application will not update the version of At Ease Setup (the administration program) for the non-workgroup product. If you use the Updater on a non-workgroup workstation, you may not be able to run your existing At Ease Setup (non-workgroups) application on that workstation.

Update Some or All Workstations

The databases used by At Ease 3.0 and 3.0.1 are fully compatible. That means

you can update some At Ease workstations on the network and not update others. To benefit from all the enhancements in version 3.0.1, however, you should update all of the workstations used by At Ease.

Using an AppleShare Server for At Ease

If your At Ease server is an AppleShare volume, all workstations must use version 3.0 (or 3.0.1). Any workstation that has an older version of At Ease will get a message reporting that the At Ease Preferences file is bad when it tries to access the server.

Updating Procedure

=====

Installation Options

There are two ways of updating one or more machines using At Ease for Workgroups—by using the Updater's floppy disk on each workstation or by installing the updated software over the network.

Updating from the Floppy Disk

Step 1

Turn off At Ease on each workstation that you are updating. (See the user's manual for instructions, if necessary.)

Step 2

Insert the Updater disk.

Step 3

Open the At Ease 3.0.1 Updater application.

Step 4

Click Begin in the greeting that appears.

Step 5

If the Updater cannot find a file it needs to update, a message appears asks you to locate that file. (If you cannot find the file, click Skip to cancel the update.)

Step 6

Locate the missing file and repeat the update procedure.

Updating Over the Network

Step 1

Copy the Updater application to an AppleShare server volume to which your workstations have access.

Step 2

Make sure the application is locked. (Select the Updater's icon, choose Get Info from the File menu, then click to place an X in the box labeled "Locked.")

Step 3

Turn off At Ease on each workstation you are updating.

Tip: Before updating any workstations on the network, you may want to turn At Ease off on machines you will be updating by using the Update Computers feature. Then, after you have updated your At Ease machines, you can turn At Ease on by using this same feature. (See the user's manual for instructions, if necessary.)

Note: After turning At Ease off, it is necessary to quit the At Ease setup application before using the update computer feature.

Step 4

Mount the server volume that contains the Updater application.

Step 5

Open the Updater application.

Step 6

Click Begin in the greeting that appears.

Files the Updater Needs to Locate

In most cases, the Updater will attempt to locate and update the At Ease and At Ease Startup files automatically. If it cannot find either of these files, it will ask you for the location of the missing file. If you cannot find these files, you can click the Skip button to stop the update, leaving your files as version 3.0.

Some administrators remove the administration program on certain workstations. For this reason, the Updater will display a message asking you to locate the setup program on your disk. If you cannot locate the program, click the skip button to bypass this request.

Use an Updated Copy of the Administration Program

Be sure to update the copy of At Ease Setup you use to administer At Ease to version 3.0.1. You should also remove any non-updated copies of this program from your hard disk (or disks). Do not leave multiple copies of the setup program on the workstations, because you may inadvertently open an old version of this program.

New Desktop Printer Extension

The Updater disk includes an Apple Extras folder. This folder contains a new version of the Desktop Printer Extension that fixes some problems that may occur when using the restricted Finder mode in At Ease.

The Desktop Printer Extension is used by printer drivers for some of the newest printers. You only need to install this extension (version 1.03) if you are using an earlier version of it. If the Desktop Printer Extension is not already in the Extensions folder inside your System Folder, do not install it. (Installing this extension will do nothing on computers that are not already using it, but it will occupy a small amount of memory.)

To install the extension:

Step 1

Open the Apple Extras folder on the Updater disk.

Step 2

Drag the Desktop Printer Extension icon to the System Folder on your hard disk.

Step 3

Click OK each time a message appears.

Changes in Version 3.0.1

=====

Launching Applications from Other Applications

Normally, for security reasons, At Ease will not allow applications to start, or sublaunch, other applications. You can allow users to sublaunch applications in At Ease in one of two ways: (a) by installing the sublaunched application in the user's setup; or (b) by using the Application Preferences command (in the Options menu) in At Ease Setup and putting an X in the box labeled "Can be launched by other applications" for each sublaunched application. Unfortunately, this process can be confusing.

Version 3.0.1 simplifies this procedure by providing one way to allow sublaunching for all applications. The User Settings dialog box (which you open by choosing User Settings in the Security menu) now contains a checkbox labeled "Always permit sublaunches." When this checkbox is selected, At Ease always allows applications to start other applications. (This setting takes precedence over any setting in the Application Preferences dialog box.)

By checking this option, an administrator does not have to worry about selecting individual applications for sublaunching. The checkbox can be best thought of as a "compatibility mode" feature that allows many applications to work better.

Log-in Procedure

To improve the log-in speed, At Ease no longer saves the panel or page information. Thus, when a user logs back into the panels environment, she or he will always be brought to the first page of the "brown" panel.

At Ease Setup Changes

When At Ease Setup starts up, it now checks the internal databases. This check can take a few seconds (when no users are logged in to the At Ease server) to almost a minute (on slow networks, when users are already logged into At Ease). A message advises you that this check is taking place.

Clarifications

=====

Using Kid Pix Studio (Correction to Read Me for At Ease 3.0)

In the Read Me file for At Ease 3.0, the section titled "At Ease for Workgroups 3.0 and Kid Pix Studio" explains how to use At Ease 3.0 with Kid Pix Studio. The information for setting up subprograms with the Application Preferences command contains an error for the file "KPS 5." The file creator for "KPS 5" should be "Kîd5," not "Kîd4."

Note: The "î" character is generated by first typing Option-i, then immediately typing "i."

CD-ROMs and At Ease

An administrator can selectively allow CD-ROMs to be used on a workstation. This feature applies only to discs that can be loaded into the CD-ROM drive of the user's computer. It does not apply to discs in CD-ROM drives that are connected to an AppleShare file server. These drive appear to At Ease as AppleShare volumes, not CD-ROM drives.

Documents Created by Approved Applications

Documents that are available to users may be opened if the application that created the document is on the "approved" list in At Ease. The software creates this list by searching locations to which the users of a setup have access, including the setup folder, the Apple Menu Items folder, the Control Panels folder, and the Startup Items folder. Folders are searched only if the users of the setup have access to them.

If any documents (or stationery pads) exist in those locations, then the program assumes that the application that created them is also approved. For example, if the Apple Menu Items folder contains a SimpleText stationery pad, and users of that setup have access to "other items" in the Apple menu, those users will be able to open any SimpleText documents, no matter where the documents are located. This is true for both panels and for the restricted Finder.

Server Mounting in At Ease

The administrator can select whether users of a particular setup can either (a) start up with the last server volumes used or (b) use the Chooser's marked startup volumes instead. The program permits only one of these options for a given setup.

This feature can be set in At Ease Setup (Workgroups) by selecting a setup and then putting an X in the box labeled "Always remember the user's last-used AppleShare logins." When the checkbox is selected, any AppleShare volumes mounted at log-out will be remembered by At Ease and remounted the next time the user logs in. When the checkbox is not selected, any server volumes that were set in the Chooser to connect at startup will mount with the same privileges as were set with the Chooser. Because this feature operates on a user-by-user basis, the setting must always be the same for any user who belongs to multiple setups.

If a server has volumes (such as a CD-ROM drive) to which you want users to have access when they log in, you should leave the "remember" checkbox unselected and use the Chooser to set up the volumes to be mounted on each workstation. You must do this on each computer, because the AppleShare information is stored in the system folder of the workstation and not on the server volume.

Disk Security

The disk security in At Ease prevents users from starting up a workstation from a floppy disk and accessing the startup hard disk. This feature was introduced in At Ease 2.0; in Version 3.0, it is a box labeled "Lock Startup Volume" in the User Settings dialog box.

If At Ease detects that the security option cannot be used on a workstation, it dims the menu command. The two primary reasons why the Lock Startup Volume option cannot be used are:

- Unknown hard disk driver

If you have reformatted your startup disk with a non-Apple hard disk driver, the disk security option may not work with that driver. If the Lock Startup Volume checkbox is dimmed, please contact the driver software manufacturer to see if that disk driver is compatible with this At Ease feature.

- Non-partitioned IDE drives

Some Macintosh computer models use a hard disk drive mechanism called IDE (or ATA) for the startup disk. (Computers that use this drive type include the Power Macintosh 5200, 5300, and 6200, and the Macintosh PowerBook models 150, 190, and 5300.)

The security in At Ease requires that the startup hard disk drives are partitioned. All SCSI hard drives are partitioned at the factory, and in the future, the IDE drives will be partitioned. But for current Macintosh models with IDE drives that are not partitioned, the disk security will work only if the IDE drive is reformatted using a partitioned driver. One program that can partition these drives is Drive7, from Casa Blanca Works. (The IDE hard drive must be reformatted in order to partition it. You cannot just update the driver

on the disk.)

At Ease and File Sharing

Turning on file sharing on a computer using At Ease 3.0 or 3.0.1 is not recommended. At Ease attempts to turn off file sharing when a restricted Finder user starts up. You should be sure that file sharing is turned off (in the Sharing Setup control panel).

Maximum Connected Users on an At Ease Server

Because At Ease can open up to four files on the server for each machine that is in the login screen, it is possible that some versions of AppleShare will not allow as many machines to connect as it may indicate in the AppleShare Admin File Server Preferences dialog. Version 4.2 of AppleShare should eliminate this restriction.

Bypassing At Ease at Startup on Certain Power Macintoshes

Certain newer Macintoshes that use System 7.5.2 may allow the user to bypass At Ease by holding down the shift key at startup time. This problem has been fixed in System 7.5.3, but an easy workaround for the time being is to turn on the "Don't allow shift key at startup to disable extensions" checkbox in the setup application. You may need to do this on each machine that is having the problem.

Incompatible System Extensions or Control Panels

Sometimes incompatible system extensions or control panels can cause software problems. Restart while holding down the Shift key to temporarily turn off all system extensions.

If At Ease works normally after you do this, use the Extensions Manager control panel to turn off individual extensions and control panels. For detailed instructions, see the "Setting Options" topic of Macintosh Guide, available in the Guide menu.

If At Ease performs better when a particular extension or control panel is turned off, contact the software's manufacturer for information or an upgrade.

Users with Multiple Setups

If a user belongs to enough setups (specifically where the total length of the setups' names, plus 1 for each setup, exceeds 154 characters), other At Ease users may experience a system crash when logging in to At Ease. To correct this problem, you should shorten the names of the setups or reduce the number of setups to which this user belongs.

Major Problems Corrected In Version 3.0.1

=====

Users Visible After Update from Version 2.x

When users update from version 2.x to version 3.0, sometimes users that were already in At Ease did not show up in the setup application. The resulting display would show setups, but no users. Users should now appear after the automatic update from 2.x to this version (3.0.1).

No Report of Damaged Preferences File at Log-in

On certain network systems (especially if workstations are not turned off periodically), a message indicating that the application preferences may be damaged appeared when a workstation logged in—even though other computers would be working properly. Restarting the server would usually clear up this problem. This problem has been fixed in version 3.0.1.

Faster Logging In or Out on Large Systems

In server-based At Ease labs with many installed users, workstations would take an excessively long period of time to log in or out. In version 3.0.1, the log-in and log-out time has been lessened for very large networks.

Documents Panel Remains Visible

When a user was logged in, a message occasionally reported that the server had been disconnected. The documents panel would disappear and not reappear, even though the server volume was not actually disconnected. This problem has been corrected.

Setup Application Correctly Recognizes Setups

The problem in which the setup application interpreted one or more setups as locked (so that they could not be modified by the administrator) has been corrected.

Virex Incompatibility Corrected

The Virex application was not compatible with At Ease 3.0. If both were installed, the system would cause a crash at startup. This problem has been corrected.

Items in the Apple Menu Remain Visible

Occasionally some aliases in the Apple menu were deleted when a restricted Finder user returned to the log-in screen. This problem has been corrected.

Servers Mount Correctly

A problem that sometimes prevented server volumes selected in the Chooser from mounting when a user logged in has been corrected. (This feature only works if the user's setup has the "Always remember the user's last-used AppleShare logins" turned off. See the user's manual for instructions.)

Import Users Function Works Correctly

..TIL19071-At_Ease_3-0-1_Updater-Read_Me_12-95.pdf

A number of changes were made to the import users function, including correcting a problem that prevented cancellation of importing when many errors occurred.

Middle-Level Administration

Middle-level administrators can now add users to setups that they own.

Apple Macintosh 7500/8500 CD-ROM: Telecom Installer (1/96)

Revised: 1/26/96
Security: Everyone

Apple Macintosh 7500/8500 CD-ROM: Telecom Installer (1/96)

=====

Article Created: 15 December 1995
Article Reviewed/Updated: 26 January 1996

TOPIC -----

When I try to install the Apple Telecom Software from the Apple Macintosh 7500/8500 CD-ROM disc v1.0.1, I get the following message, "The alias 'Apple Telecom Install' could not be opened, because the original item could not be found."

How do I install the software?

DISCUSSION -----

This error occurs because the alias to the Apple Telecom Installer, on the Apple Macintosh 7500/8500 CD-ROM disc v 1.0.1, is not linked to the correct file. To install the Apple Telecom software from this version of the CD follow this procedure:

From the Apple Macintosh 7500/8500 CD-ROM disc v 1.0.1:

Step 1

Open the Apple Extras folder.

Step 2

Open the Apple Telecom folder.

Step 3

Open a second Apple Telecom folder.

Step 4

Open the Apple Telecom Disk 1 folder.

Step 5

Double-Click the Installer icon. (You may have to scroll down the window, to locate the software.)

Step 6

Follow the installation directions presented on screen.

The Installer will guide you through the installation, and prompt you to restart the computer once the installation is completed.

AppleShare and Personal File Sharing: FAQ (11/96)

=====

Article Created: 18 December 1995
Article Reviewed/Updated: 25 November 1996

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) on both AppleShare and Personal File Sharing.

Questions in this FAQ:

- 1) What do I do if my users cannot see the server?
- 2) What do I do if my users cannot log on?
- 3) My users get disconnected unexpectedly. What can I do?
- 4) I selected inherited privileges over explicit, but it is not working. What can I do?
- 5) I lost (or forgot) my administrator's password. What can I do?
- 6) What can I do to speed up my server?
- 7) I cannot get into the Users and Groups control panel on the server. What can I do?
- 8) My server crashes continually. What can I do?
- 9) I cannot eject removable media. What can I do?
- 10) How do current AppleShare users upgrade to AppleShare 4.2?
- 11) Is AppleShare 4.2 compatible with Open Transport?
- 12) Does AppleShare 4.2 run on PCI-based Macintosh systems?

13) Will AppleShare 4.2 run on 68040 machines? Will it run on non- Workgroup Server platforms?

14) Where is the Owner Name and Macintosh Name found in the Sharing Setup control panel stored?

DISCUSSION -----

1) Question: What do I do if my users cannot see the server?

Answer: Check the following for a possible solution.

- Make sure file server application has been launched.
- Make sure something has been shared with the Admin program.
- Make sure the proper network driver is chosen in Network control panel.
- Check that network cable connections are securely attached.

2) Question: What do I do if my users cannot log on?

Answer: Check the following for a possible solution.

- Make sure the client user has the correct name and password.
- Make sure the caps lock key has not been pressed.
- Make sure that login is enabled for the user in the Admin program.
- Make sure something has been shared in the admin program and that the user has access to the shared item.

3) Question: My users get disconnected unexpectedly. What can I do?

Answer: Check the following for a possible solution.

- Check to be sure the server has not crashed.
- Check for network problems, for example look for termination issues with the network.

4) Question: I selected inherited privileges over explicit, but it is not working. What can I do?

Answer: Refer to the Apple Technical Info Library, and use the search string "inherit and explicit", to find the article, "AppleShare: Inherited Privileges Problem".

5) Question: I lost or forgot my administrator's password. What can I do?

Answer: Procedures vary depending upon which version of AppleShare File Server software being used. Refer to the Apple Technical Info Library and use the search string "appleshare and admin key" to find the article "AppleShare Admin: What To Do If You Lose the Password".

6) Question: What can I do to speed up my server?

Answer: Check the following for a possible solution.

- Make sure remote user activity meter is set to 100%, which lets the server access 100% of the available CPU cycles.
- Check to see if other applications are running on the server, like Apple Internet Router, Print Server, or an e-mail server. If possible transfer these applications to another computer. Remove third-party extensions from the computer to eliminate extension conflicts, or perform a clean system software installation if necessary. On AppleShare 4.0.x or 4.1 servers, you could experiment with different cache settings, as explained in the manual.
- Look for bottlenecks. If the server is using LocalTalk cabling, consider using Ethernet. Consider getting a higher performance hard disk drive or caching SCSI card. Consider upgrading to faster server hardware.
- There is no benefit in increasing RAM allocation to file server application in the Get Info window. The file server extension allocates the amount of memory it needs based on the number of concurrent users set in Admin program.
- Try adjusting Disk cache in the Memory control panel anywhere from 256K to 2048K. With AppleShare 3.0, there is no benefit to setting Disk cache above 2048K.

7) Question: I cannot get into the Users and Groups control panel on the server. What can I do?

Answer: To access users and groups information on an AppleShare server, you must use the Admin program. The Users & Groups control panel no longer works after AppleShare has been installed. If Apple Remote Access (ARA) is also installed on the server, you must use the AppleShare Admin program to change the users and groups information.

8) Question: My AppleShare file server crashes continually. What can I do?

Answer: Troubleshoot as you would any other system, for example, check for extension incompatibilities, SCSI bus, or corrupt software. Also make certain you at least have AppleShare v 3.0.1 of software.

If a clean installation of the system software and/or AppleShare software is required, BEFORE LAUNCHING THE ADMIN PROGRAM do the following to prevent loss of access privileges:

- Reset the server name in the Sharing Setup control panel. This can be any name, just do not leave the computer name field left blank.
- Restore the saved Users & Groups Data file to the Preferences folder in the System Folder.

These two items will prevent a new PDS file from being created, which would

cause all access privileges to be lost. The AppleShare PDS file is an invisible file at the root level of each shared volume which keeps track of the access privileges for that volume. The Users & Groups Data File is the file that keeps the information about users, groups, and the Admin key (password).

9) Question: I cannot eject removable media. What can I do?

Answer: Try one or more of the following:

- If no users are logged on, drag the icon to the trash.
- If users are logged on, select the UnMount Volume command from the Server menu of file server application.
- If you tried the above but are still having problems, check the SCSI driver versions, the latest are recommended.
- A freeware utility, UnmountIt, may or may not help to unmount removable volumes. Look for it on ftp.apple.com, or through user groups. Note, this utility is not supported by Apple.

10) Question: How do current AppleShare users upgrade to AppleShare 4.2?

Answer: Customers who purchased AppleShare 4.0, 4.0.1, 4.0.2 or 4.1 prior to September 1, 1995 will pay an upgrade fee plus shipping and handling. Customers who purchased AppleShare 4.0.2 or 4.1 on or after September 1, 1995 will receive the AppleShare 4.2 Update for just the cost of shipping and handling. Call the Apple Order Center for further upgrade information.

NOTE: AppleShare 4.2 is supported only on NuBus equipped Power Macintosh and Workgroup Server computers.

11) Question: Is AppleShare 4.2 compatible with Open Transport?

Answer: AppleShare 4.2 is not compatible with Open Transport. AppleShare 4.2.1 will run on NuBus PowerPC Workgroup Servers 6150/xx, 8150/xx & 9150/xx with the classic AppleTalk stack. (Performance with the classic stack is still faster than Open Transport on these computers. With a future release of Open Transport or AppleShare this may change.) AppleShare 4.2.1 will also run on Open Transport based Workgroup Servers 7250/120 and 8550/132.

12) Question: Does AppleShare 4.2 run on PCI-based Macintosh systems?

Answer: AppleShare 4.2 will NOT run on PCI-based Power Macintosh computers. An AppleShare 4.2.1 is supported on these computers.

13) Question: Will AppleShare 4.2 run on 68040 machines? Will it run on non-Workgroup Server platforms?

Answer: AppleShare 4.2 will NOT run on 68040 or earlier computers. AppleShare 4.2 will run on NuBus equipped Power Macintosh computers, but is only available

on Workgroup Servers or as an upgrade for previous owners of AppleShare 4.x.

14) Question: Where is the Owner Name and Macintosh Name found in the Sharing Setup control panel stored?

Answer: The Owner Name and Macintosh Name are stored in the System suitcase of the active System Folder.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Apple MPEG Media System: Read Me File (8/96)

Revised: 8/19/96
Security: Everyone

Apple MPEG Media System: Read Me File (8/96)

=====

Article Created: 18 December 1995
Article Reviewed/Updated: 19 August 1996

TOPIC -----

This article contains the readme file for the Apple MPEG Media System Software.

DISCUSSION -----

Apple MPEG Media System (AMMS) Software 1.0

What is the Apple MPEG Media System Software?

The Apple MPEG Media System Software works in conjunction with the Apple MPEG Media System card to add functionality to your Apple Macintosh or Power Macintosh computer and allows the playback of MPEG-compressed digital video.

Requirements

The computer on which the software is to be installed must have an Apple MPEG Media System card installed in the LC processor-direct slot (PDS) and either the Apple Video System or the Apple TV/Video System installed in the video input slot. System 7.5 (which includes QuickTime 2.0 and the QuickTime Power Plug for Power Macintoshes) is required.

Contents

The Apple MPEG Media System Software CD consists of:

- MPEG Media Software - This folder contains system extensions that add

functionality to your computer for the support of MPEG video playback, including:

- Video Digitizer Update - This is the low level software interface to the video hardware for support of the Apple MPEG Media System card.
- AMMS MPEG Decoder - This is the hardware driver for the Apple MPEG Media System card.
- QuickTime 2.0 AMMS Update - This is an update to provide MPEG support within QuickTime 2.0.

- Video Software - This folder contains the Apple Video Player application and system extensions that allow you to view TV, external video, and MPEG digital video on your computer. This release adds MPEG video data support.

- CD-ROM Software - This folder contains updated system extensions that add functionality to your computer for the support of CD-ROM drives. This release adds support for MPEG video data as well as a wider variety of CD-ROM drives.

Installing the Apple MPEG Media System Software

To install the Apple MPEG Media System software:

- 1) Insert the Apple MPEG Media System Software CD into your CD-ROM drive with the disc label facing up.
- 2) Double-click on the "Installer" icon in the MPEG Media System Software v1.0 folder. The installer dialog will appear on your screen.
- 3) Click on the "Install" button. The software will be automatically installed.
- 4) When the installer has finished copying the software to your system, it will force a restart of the machine.

Notice:

The Apple MPEG Media System Software requires QuickTime 2.0 or greater.

Logic Board Reset Button

The "Apple MPEG Media System Installation Guide" instructs the person installing the Apple MPEG Media System card to press the reset button on the logic board before sliding the logic board back into the computer case. Occasionally, after installing new hardware in your computer, the computer will not reboot until the reset button has been pressed. Pressing this button will also reset the following System 7.5 system parameters to their default values. Any of these values that you have changed from their defaults will need to be reentered after pressing the reset button.

- system date and time
- mouse tracking

- master sound volume
- double click rate
- caret (insertion point) blink rate
- disk cache size
- menu blink
- auto key threshold and rate
- default boot device
- alert sound
- default hilite color
- default Appletalk (network) connecton

Limitations

- If the computer crashes or is turned off while the Apple Video Player is open, the Apple Video Player Prefs file may become corrupted. If the computer has problems loading VideoStartup at boot, drag the Apple Video Player Prefs file to the trash and reboot.
- The MPEG hardware only supports playback of one MPEG movie at a time. Some cosmetic problems may occur if multiple MPEG movies are opened at the same time.
- The Video and Audio of MPEG files may stutter momentarily when movie time location is changed during playback by using the slider control.
- Video capture of MPEG movies is not currently supported. Future software releases will include this functionality.
- The "Sharpness" slider does not affect MPEG movies in Apple Video Player.
- Some MPEG files, such as those which are playable by the Sparkle application, are not currently supported. Future software releases will support playback of these files.
- Apple Video Player was not designed to play QuickTime movies so movies containing a mix of MPEG and QuickTime data may not play properly in Apple Video Player.
- Changes made in the Finder (adding or deleting MPEG files) are not reflected in the Apple Video Player pop-up menu unless Apple Video Player is exited and restarted.
- Apple Video Player MPEG Movie Selector pull-down menu holds a maximum of 40 movies.
- Frame forward and frame backward buttons do not control MPEG movies as smoothly and accurately as with standard QuickTime movies.
- Multisession CD-ROM drives are required for playing MPEG movies form CD-ROMs. The Apple CD SC, CD SC+ and PowerCD are not multi-session drives and do not support MPEG.

- Some CD-i movies may not support chapter navigation.

Macintosh 5200, 5300, 6200, & 6300: Audio Sampling Rates (1/96)

Revised: 1/3/96
Security: Everyone

Macintosh 5200, 5300, 6200, & 6300: Audio Sampling Rates (1/96)

Article Created: 18 December 1995
Article Reviewed/Updated: 3 January 1995

TOPIC -----

I am using a sound editing application on my Macintosh Performa 5300 computer, but I am unable to get a sampling rate higher than 22.050 kHz. I have also noticed that 22.050 kHz is the only option available in the Sound control panel. Is there any way to get a higher sampling rate?

DISCUSSION -----

Many Macintosh computers support 44.100 kHz. However, the entry-level Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers with 16-bit sound only support 22.050 kHz audio.

Fax Viewer & Type 11 Error: Printing to StyleWriter (2/96)

Revised: 2/8/96
Security: Everyone

Fax Viewer & Type 11 Error: Printing to StyleWriter (2/96)

Article Created: 18 December 1995
Article Reviewed/Updated: 8 February 1996

TOPIC -----

When trying to print received Fax documents to a StyleWriter 1200 or Color StyleWriter 2400 from a Macintosh Performa 5300 with Fax Viewer v S1-2.1, I get a type 11 error. I do not think the computer model is the issue, but printing received Fax documents to a non-PostScript printer is. What can I do to print Fax documents to a non-PostScript printer

DISCUSSION -----

There was an issue with the Fax Viewer Application which would cause a type 11 error and crash when printing to the two printers you reported.

According to engineering, this issue was addressed with Apple Telecom 2.3. This software has been localized and should be available.

You should install the newer software to update the Fax Viewer program.

Macintosh PowerBook 2300 Series Computer Read Me (5/96)

Article Created: 18 December 1995
Article Reviewed/Updated: 26 May 1996

TOPIC -----

This article is the PowerBook 2300 series computer ReadMe.

DISCUSSION -----

Important Information About Your Macintosh PowerBook 2300 Series Computer
=====

Congratulations on purchasing your Macintosh PowerBook 2300 series computer. This document adds to and updates the information in the manuals that came with your computer. It is a good idea to read this document now, and keep a copy handy for future reference.

If your PowerBook is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

Contents

Tips

- Charging your battery
- Using the Battery Monitor in the Control Strip
- Using the trackpad
- Using a modem
- Using your PowerBook in SCSI disk mode
- Using multiple SCSI devices
- Using the Password Security control panel
- Printing
- Using MIDI with your PowerBook

Troubleshooting

- Problems starting your PowerBook

- Using an external monitor with your PowerBook
- Using video mirroring
- Using Drive Setup
- Using Acrobat Reader after installing QuickDraw GX
- Using Apple Remote Access
- Using a DigiSign Signature Card with PowerTalk
- AppleShare Displays Incorrect Information for Large Drives
- AppleShare Server Software
- Application Programs Using Sound
- Using QuickDraw GX with a Fax Modem
- Using PowerTalk and PowerTalk Direct Dialup Mail
- Using the Apple Internet Connection Kit
- Using the Japanese Language Kit
- Using the Chinese Language Kit

Important Information About Virtual Memory

Tips

====

Charging your battery

You should connect the power adapter to your computer and let the battery charge overnight when you first unpack your computer. (The battery may have been depleted between the time it was charged at the factory and the time you purchased the computer.)

Using the Battery Monitor in the Control Strip

The estimated time remaining that is displayed in the Battery Monitor portion of the Control Strip depends on the charge remaining and the battery consumption rate. The battery consumption rate depends on the software and hardware features you are using.

- The battery icon in the Battery Monitor portion of the Control Strip may show the battery as charging even after the PowerBook has been plugged in for a while.

Using the trackpad

If the trackpad seems unresponsive, try the following in the order listed:

- 1) Put your PowerBook to sleep (by closing the display) and then wake it up (by pressing any key on the keyboard).
- 2) Press the reset button on the back of the computer.
- 3) Reset the parameter RAM (PRAM). (To reset PRAM, restart your Macintosh. Immediately after hearing the startup sound, press the Command, Option, P, and R keys simultaneously. For complete instructions on resetting PRAM, see the Troubleshooting chapter in your user's guide.)
- 4) Attach an external mouse.

Using a modem

-
- To improve modem performance, turn off LocalTalk in the Chooser.
 - When accessing the internet using the InterSLIP protocol, use the 14.4K baud rate rather than the 28.8K baud rate for better performance. The actual throughput at 14.4K baud is higher than at 28.8K baud.

Using your PowerBook in SCSI disk mode

- Using Norton Utilities Speed Disk or Disk Doctor from a desktop computer on your PowerBook while it is in SCSI disk mode may cause the desktop computer to crash or freeze. To avoid this problem, create an emergency startup floppy disk using Norton Utilities and then use that disk to startup your PowerBook.
- You cannot use password protection on your PowerBook while the PowerBook is in SCSI disk mode. Turn off password protection in the Password Security control panel before connecting your PowerBook in SCSI disk mode.

Using multiple SCSI devices

If you are using several SCSI devices in a chain and are having problems starting your computer, follow these steps:

1. Make sure all the SCSI devices are properly connected.
2. Make sure all the SCSI devices are plugged in to working power outlets and turned on.
3. Make sure the SCSI chain is terminated at the end.

If you still have problems starting your computer, try placing a terminator at the beginning and the end of the SCSI chain.

Using the Password Security Control Panel

The Password Security control panel provides security for information stored on your hard disk. To use this feature, you must enter a password and turn it on. If you forget or lose your password, you will not be able to access your hard disk. Should you lose your password, Apple may charge for assistance.

You cannot use your PowerBook in SCSI disk mode with password protection turned on in the Password Security control panel. You must turn it off before using your PowerBook in SCSI disk mode.

Printing

If you are printing on a network printer, make sure you have the same version of printer software as others on the network. If you are using a StyleWriter II on a network, make sure you use the StyleWriter printer driver that came with your computer. (Printer drivers are found in the Extensions folder).

Using MIDI with your PowerBook

To avoid errors in data transfer, turn off AppleTalk in the Chooser when using a MIDI interface connection (to the serial port) with your PowerBook.

NOTE: When AppleTalk is off, your LocalTalk and Ethernet connections will be unavailable, and you cannot use external devices, such as printers, that have AppleTalk or Ethernet connections. All these connections will be available when you turn AppleTalk on again.

Troubleshooting

=====

Problems starting your PowerBook

When you shut down the computer, be sure to wait at least 10 seconds before restarting. If you encounter a software problem that requires restarting (such as the pointer freezing), wait at least 10 seconds before restarting with the Command-Control-Power key combination.

If you see an error message (sad Mac icon) after you restart, press the reset button on the back of the computer to correct the problem.

Using an external monitor with your PowerBook

On some systems, the Monitors control panel does not include buttons named "Rearrange on Restart" and "Rearrange on Close" as described in Macintosh Guide.

Using Video Mirroring

Some application programs are not compatible with video mirroring, and may cause information to be displayed inconsistently.

Using Drive Setup

Make sure you only use the Drive Setup application program that comes with your PowerBook to update and partition hard disks. If you use an earlier version of Drive Setup (called Apple HD SC Setup) you might damage files or data on your computer.

Using Acrobat Reader after installing QuickDraw GX

Once you install QuickDraw GX, you need to reinstall Acrobat Reader on your computer in order to use it. Double-click the Acrobat Reader Installer icon in the Adobe Acrobat Reader folder (inside the Applications folder).

Using Apple Remote Access

Make sure you use only Apple Remote Access Client 2.0.1 (or later) or Apple Remote Access Personal Server 2.0.1 (or later) on your PowerBook. Earlier versions will not work. If you use the Personal Server, an ARA 1.0 call will not connect to your PowerBook.

Using a DigiSign Signature Card with PowerTalk

To use the Apple DigiSign Utility with PowerTalk, follow these steps:

- 1) Turn off processor cycling in the PowerBook control panel.
To see the option for processor cycling, hold down the option key while you select Custom in the PowerBook control panel.
- 2) Follow the steps for creating a Signer file.
If you need help, select "How do I obtain a valid Signer file?" in the Digital Signatures topic of the PowerTalk Guide.
- 3) Turn processor cycling back on in the PowerBook control panel.

AppleShare displays incorrect information for large drives

If you use file sharing to connect to a disk attached to another computer, and the shared disk is larger than 2 gigabytes (GB), the Get Info box for that disk shows an incorrect size. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

AppleShare Server software

Make sure you use only AppleShare server software version 4.2 or later on your PowerBook.

NOTE: This note is not part of the original Read Me, it is being added to correct information presented here. AppleShare 4.2 or later is not sold separately and is available when purchasing a Workgroup Server. Also AppleShare v 4.2 is not supported on these computers.

Application programs using sound

If you have application programs that make extensive use of sound, you should turn off virtual memory while using those programs. When virtual memory is turned on, it can compromise the programs' sound quality.

Some older versions of programs, especially games, may generate sounds that seem too slow or too fast. For best results with these programs, open the Sound control panel, choose Sound Out from the pop-up menu, and set the sample rate to 22.050 kHz.

Using QuickDraw GX with a fax modem

If you installed QuickDraw GX and you have a fax modem, you need a QuickDraw GX modem driver in order to send faxes. Contact the fax software manufacturer to obtain the QuickDraw GX driver.

If you have installed QuickDraw GX and do not yet have the QuickDraw GX modem driver, you can temporarily turn off QuickDraw GX and use your previous fax modem driver. To turn off QuickDraw GX:

- 1) Hold down the Space bar while you choose Restart from the Special menu to restart your PowerBook. Continue to hold down the Space bar until the Extensions Manager appears on the screen.
- 2) Click the QuickDraw GX extension to remove the check beside it.
This prevents the QuickDraw GX software from loading.
- 3) Click the close box in the Extensions Manager window to resume startup.

Your fax modem should work normally. You won't be able to use any QuickDraw GX features until you turn the extension back on again.

Using PowerTalk and PowerTalk Direct Dialup Mail

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Using the Apple Internet Connection Kit

The Apple Internet Connection Kit version 1.0 is incompatible with virtual memory (VM). If you want to use the Apple Internet Connection Kit version 1.0, first turn off VM in the Memory control panel.

Using the Japanese Language Kit

To use the Japanese Language Kit with your Macintosh PowerBook, make sure you use version 1.2 or later. In the United States, you can obtain an upgrade, with proof of purchase, by calling Apple Order Center. Customers outside of the United States should contact their local Apple-authorized dealer.

After you install the Japanese Language Kit 1.2, you need to replace an extension that gets installed with the software. Follow these steps:

- 1) Follow the instructions for installing the Japanese Language Kit 1.2 that came with the software.
- 2) After you see that the installation was successful, restart the computer with the Extensions off. To do this, hold down the shift key while you press the Restart button in the installer screen (or as you choose Restart from the Special menu).
- 3) Double-click the Apple Extras folder to open it.
- 4) Double-click the JLK 1.2 Update folder to open it.
- 5) Drag the file called "Font Extension 3" to the Extensions folder (inside the System folder) on your hard disk. Click OK if you see a dialog box asking if it is ok to replace this file.
- 6) Choose Restart from the Special menu.

Using the Chinese Language Kit

To use the Chinese Language Kit with your Macintosh, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, first install the World Script Updater 1.0. Then install the Chinese Language Kit version 1.1. Finally, install the Chinese Language Kit Updater to update your software to version 1.1.1.

To install the World Script Updater, follow these steps:

- 1) Double-click the Apple Extras folder to open it.
 - 2) Double-click the World Script Install folder to open it.
 - 3) Double-click the World Script Installer icon.
- Follow the instructions on the screen.

- 4) Follow the instructions that came with the language kit to install the language kit software.

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory may help you avoid running out of memory.

Your computer comes with virtual memory turned on. With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems using certain programs, you may want to turn off virtual memory. You may also want to turn virtual memory off from time to time to extend work time while using the battery. You can turn virtual memory on and off in the Memory control panel. For specific information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. Then click "How do I use hard disk space as memory?" and "How do I manage Power Macintosh memory?"

For best performance, try setting virtual memory to no more than 150% of the amount of physical memory (RAM), or no more than 50% of your currently available hard disk space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (150% of 16, which is less than 50% of 50).

Note: You cannot set virtual memory to more than 1024 MB, even if you have 1 gigabyte (GB) or more available space on your hard disk.

To improve performance, you can also add physical memory (RAM) to your computer. See the user's manual that came with your computer for more information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Drive Setup: Cannot Update Driver or Other Options (2/97)

Revised: 2/28/97
Security: Everyone

Drive Setup: Cannot Update Driver or Other Options (2/97)

Article Created: 18 December 1995
Article Reviewed/Updated: 28 February 1997

TOPIC -----

This article describes a couple of issues where Drive Setup options may not be available.

While running the "four step" Install Mac OS application, on the Mac OS 7.6 CD-ROM, and performing the Update your hard disk driver option, a message appeared stating "This media is not partitioned, unable to update the driver."

Drive Setup cannot update the driver on some SCSI and IDE drives, the Update driver, Customize volume, and Test disk selections are dimmed; Initialization options are available. The dimmed options become available only after initializing the hard drive.

Why are these options not available with Drive Setup, and do I have to re-initialize the hard drive to make these options available?

DISCUSSION -----

There are several reasons why those options may not be available, depending on which computer you are using.

PowerBook Password Security

If you are using a PowerBook, you need to first disable the password protection feature in the Password Security control panel. Password security prevents Drive Setup from updating the driver.

Media Not Partitioned

The first IDE drives installed in Macintosh computers were initialized with the Internal HD Format 1.x utility, and did not have partitioning information.

Drives that show "Where: Macintosh HD, AT_0" in the volume's Get Info window are such drives. IDE drives partitioned with Drive Setup include partition information. This is why Apple's Internal HD Format utility does not recognize newer IDE drives. For more information search for the following Tech Info Library articles:

- "Internal HD Format: Cannot See IDE Drives"
- "Macintosh Desktop & PowerBook Computers: IDE Hard Drive"

When a volume is selected in Drive Setup, the application looks for partition information on the hard disk. If it finds this partition information, the option to update the disk's driver is available. If this partition information is absent, you have to re-initialize the hard disk to properly format it to include this partition information in order to access the other options.

WARNING:

Reformatting or re-initializing your hard drive erases all information on your disk. Make sure you have a backup of all files you may have created and any pre-installed software that came with your computer.

The latest version of Drive Setup is 1.2.2 and included with the Mac OS 7.6 CD-ROM disc. Drive Setup 1.2 is available at Apple Computer's software update locations. You use the Drive Setup or HD SC Setup programs to update your disk driver or to re-initialize a disk.

The following computers should use the Drive Setup program:

All computers with PowerPC microprocessors

- Macintosh LC 580 series
- Macintosh LC 630 series
- Macintosh LC 630 DOS Compatible
- Macintosh Quadra 630 series computers
- Macintosh Performa 580 series computers
- Macintosh Performa 630 and 640 series computers
- PowerBook 150 series computers
- PowerBook 190 series computers

All other computers should use HD SC Setup.

NOTE: Drive Setup does not work with PowerPC Upgrade Cards. You can use HD SC Setup to update your driver or initialize a disk, but you need to turn off the PowerPC upgrade card before using HD SC Setup.

NOTE: PowerBook 150 computers do not need to update the internal hard disk driver. That driver is contained in your computer's ROM. If you try using either utility program to update the driver, nothing will happen.

Power Macintosh 7200 & 9500: Generic Icons on System CD (12/95)

Revised: 12/19/95
Security: Everyone

Power Macintosh 7200 & 9500: Generic Icons on System CD (12/95)

=====

Article Created: 19 December 1995

TOPIC -----

I have a Power Macintosh 7200, and I've noticed that some of the icons on the system software CD appear generic. What could be wrong?

DISCUSSION -----

Apple has determined that there is a problem with the desktop database files on the CD. This issue is cosmetic and should not affect the performance of the applications on the CD. Apple will address this issue on future versions of the system software CD.

Power Macintosh 9500: Unable to Sleep (12/95)

Revised: 12/19/95
Security: Everyone

Power Macintosh 9500: Unable to Sleep (12/95)

=====

Article Created: 19 December 1995

TOPIC -----

I have a Power Macintosh 9500 and an AppleVision 1710AV Display. Whenever I select Sleep from the Special menu, the screen goes black for a few seconds and then the image comes back on the screen. This happens in every resolution. How can I get the computer to sleep?

DISCUSSION -----

You need an updated System Enabler for the Power Macintosh 9500. System Enabler 701 v1.1 corrects this issue and is available on the Power Macintosh 9500 CD v2.0 or later.

Power Macintosh: Port in Use After Installing GeoPort (1/96)

Revised: 1/26/96
Security: Everyone

Power Macintosh: Port in Use After Installing GeoPort (1/96)

=====

Article Created: 19 December 1995
Article Reviewed/Updated: 26 January 1996

TOPIC -----

I have a Power Macintosh 7200/90 with a laser printer attached to the printer port (using LocalTalk) and a Color StyleWriter 2400 attached to the modem port. After installing the Apple Telecom software for the GeoPort, I get a "port in use" error message when printing the second page to the Color StyleWriter. Is there a problem with the serial ports on the computer?

DISCUSSION -----

There is not a hardware problem with the serial ports. The "port in use" message is the result of a software conflict between the Apple Telecom software and the printer driver.

The Apple Telecom software takes complete control of the modem port when installed on a Power Macintosh. It must do this to make applications recognize the external modem. Any data that is sent to the modem port is interpreted as data meant for a modem and is processed by the Apple Telecom software. The Apple Telecom software combined with the GeoPort adapter essentially create a software-based modem.

So, although you can disconnect the GeoPort Telecom Adapter and connect the printer to the modem port, the Telecom software is still installed. Because the Telecom software is still installed, it will send data out the modem port as if it was meant for the Telecom Adapter. The software expects to control the modem port whether or not an adapter is attached, and this results in the "port in use" error message or unusual printouts.

The only workaround is to de-install the Apple Telecom software using the installer application.

MAE 2.0 License Manager & su Command in Solaris 2.4 (12/95)

Revised: 12/19/95
Security: Everyone

MAE 2.0 License Manager & "su" Command in Solaris 2.4 (12/95)

Article Created: 19 December 1995

TOPIC -----

The license manager in MAE does not seem to let the use of the "su" command switch to a licensed MAE account.

For example, create two accounts on a SPARCstation, calling one "works" and the other "doesnt". Use the license manager and give "works" access to use MAE. Then if you login with the "works" account, MAE functions as it should. However, if you login with "doesnt" account and enter "su - works", your environment changes to the "works" account, but you will not be able to run MAE.

Is there a workaround for this other than having to log out and log back in as the other user?

DISCUSSION -----

We were able to run MAE with the "su - username" command successfully with the following extra settings before launching MAE under Solaris 2.4, as a reference we followed your example above:

Step 1

Login as "doesnt" from the initial Solaris Login session

Step 2

Launch /usr/openwin/bin/openwin

Step 3

Create two "cmdtool" windows, for example, cmdtool.1 and cmdtool.2

Step 4

On the cmdtool.2 window, enter the command:

```
% su - works
```

Then set the DISPLAY environment variable, and export it.

```
% DISPLAY=sparc5:0.0; export DISPLAY
```

Step 5

On the cmdtool.1 window, you need to disable X server access control, or assign server access to a host. In Solaris 2.4 by default the X server access control is enabled, and no hostname is authorized to run ANY X program EXCEPT running from the initial login shell. Therefore you need to use "superuser" to explicitly grant access or disable access control with one of the following commands:

```
% su (as a super user)
# /usr/openwin/bin/xhost + (disable access control)
```

Step 6

On the cmdtool.2 window, you can now launch MAE with the MAE binary full path, example command:

```
% /opt/apple/bin/mae
```

NOTE: In HP-UX by default the X server access control is also enabled, but the "localhost" and the real local hostname, for example "hp715", are automatically authorized by the X server. Therefore you do not have to run "xhost" to assign access for your local workstation.

PowerBook: Miscellaneous Frequently Asked Questions (2/97)

=====

Article Created: 19 December 1995
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about miscellaneous topics concerning Macintosh PowerBook computers.

DISCUSSION -----

- 1) It has been determined that my PowerBook has a hardware problem and needs service. What are my service options?
- 2) How does Apple's PowerBook service mail-in program work?
- 3) Can I use my PowerBook on an airplane?
- 4) Are the airport X-ray machines dangerous to my computer?
- 5) What are the differences between active and passive-matrix displays? Which PowerBooks have which?
- 6) Should I always use the feet on the PowerBook?
- 7) When I am using the PowerBook with an external monitor can I close the display on the PowerBook?
- 8) Do I need a screen saver on my PowerBook?
- 9) What are the differences in PowerBook SCSI cables from Apple?
- 10) I am trying to connect a SCSI device to my PowerBook. However, when I start up the PowerBook, a diamond icon with a number appears on my screen.
- 11) I'm trying to connect my PowerBook as an external hard drive (SCSI Disk Mode) to another Macintosh. When I turn on my PowerBook, I get a flashing

question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.

12) What is SCSI disk mode?

13) Which PowerBook models can accomplish SCSI disk mode?

14) What are the instructions for connecting a PowerBook in SCSI disk mode?

15) Which PowerBook models can use an external monitor?

16) What should I use to clean the PowerBook?

17) Sometimes I can't seem to use my internal modem and print at the same time. Why is this?

18) Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

19) Is it safe to move my PowerBook while it is on?

20) Can I install a hard drive from my PowerBook Duo 280 into my PowerBook 140?

21) Where else can I go for answers?

22) Where I can get the latest Apple software updates online for my PowerBook?

DISCUSSION -----

1) Question: It has been determined that my PowerBook has a hardware problem and needs service. What are my service options?

Answer: You can contact the Apple Assistance Center at 800-SOS-APPL (800-767-2775) to arrange for repair at our repair center or you can contact the Apple Referral Center at 800-538-9696 to obtain a phone number for an Apple-authorized service provider in your area. Note that the Apple Assistance Center may wish to perform further troubleshooting, so you should have your PowerBook with you when you call.

2) Question: How does Apple's PowerBook service mail-in program work?

Answer: If the technical support representative at the Apple Assistance Center (800-767-2775) determines that there is a hardware problem with the PowerBook, Apple will have Airborne Express pick up the PowerBook the next business day. The fixed PowerBook will usually return within 2-3 business days. For example, if you call 800-SOS-APPL on a Monday, the PowerBook will be picked up on Tuesday, and will usually be back by Thursday or Friday. As long as the PowerBook is covered under warranty, the entire repair process is provided at no cost. If the PowerBook is not under warranty, shipping, labor, and parts costs will apply.

3) Question: Can I use my PowerBook on an airplane?

Answer: It is best to check with your airline to find out specific rules for your flight. Airline pilots have reported instrument interference from electronic devices used on airplanes. Be aware that if the PowerBook is moved or bumped while the hard drive is spinning, the hard drive can be damaged resulting in lost data.

4) Question: Are the airport X-ray machines dangerous to my computer?

Answer: The X-rays emitted from the machine are not at all dangerous to the computer. However, the metal rollers below the conveyor belt emit a magnetic field that could damage the data on the hard drive if the shielding is not adequate. We have never heard of a report of this being a problem in the United States, but in under-developed countries you might want to ask that the PowerBook be hand checked. Usually a security guard will require you to demonstrate that the computer is functional, so it is a good idea to have the PowerBook in sleep mode to make it quick.

You should be aware that the metal detecting batons used by some security guards emit a very strong, unshielded, magnetic field. You should avoid getting the computer and any magnetic media, such as floppy disks, near these devices.

5) Question: What are the differences between active and passive-matrix displays? Which PowerBooks have which?

Answer: Passive-matrix screens apply the electric field voltages along the edges of the screen, so that pixels appear light and dark at the intersection of rows and columns. Each pixel is passively responding to voltage differences applied along the horizontal and vertical edges of the screen. It is difficult to get a large number of crystals to line up quickly, and completely. So passive-matrix screens are relatively slow and provide less precise definition.

Active-matrix screens use a single transistor at every single pixel location. This provides a good strong source of electric field, and it only has to act on a very tiny region of liquid crystals. So they are quite fast and every crystal in a pixel is lined up perfectly.

The merits of the passive screen are lower cost and lower power usage. But the angle at which you can view the screen undistorted is smaller than for an active-matrix screen. Also, a passive-matrix screen is not as bright as its active-matrix counterpart.

You may experience submarining on a passive-matrix screen, meaning the pointer tends to disappear momentarily when you move it quickly across the screen until it catches up with the trackball. You may also notice speed trails, or shadowy, comet-like trails following the pointer or other objects you drag around the screen. They disappear as quickly as they appear, but some users find them distracting. Gray-scale passive-matrix screens are particular susceptible to these anomalies.

An active-matrix screen is brighter and provides better definition. The screen

is also less likely to distort when viewed at more extreme angles.

PowerBook computers with active-matrix screens:

170, 180, 180c, 250, 270c, 280, 280c, 540, 540c, 5300c, 5300ce, 2300c

PowerBook computers with passive-matrix screens:

100, 140, 145, 145B, 150, 160, 165, 165c, 190, 190cs, 210, 230, 520, 520c, 5300, 5300cs

6) Question: Should I always use the feet on the PowerBook computer?

Answer: Heat is dissipated through the bottom of the PowerBook and through the keyboard. If the feet are not used while the PowerBook is in use, it is possible that the PowerBook will overheat and shut off or even damage the hardware inside the computer. We recommend that you always use the elevation feet when using the PowerBook.

7) Question: When I am using the PowerBook with an external monitor can I close the display on the PowerBook?

Answer: As discussed above, heat is dissipated through the bottom of the PowerBook and through the keyboard. If the PowerBook display is active and the display is closed, it is possible that enough heat will be generated that the display will distort or warp. We recommend that you leave the display open by at least 1" for heat dissipation.

It is possible to use 200, 2300, 190, and 5300 series PowerBook computers in a mode that does not require the display to be open. To use the PowerBook computer in this mode, follow these steps.

Step 1

Connect the monitor to the PowerBook while the PowerBook computer is off.

Step 2

Close the display on the PowerBook computer.

Step 3

Using an external keyboard, press the power button. If you are not using an external keyboard, press the power button on the PowerBook computer's keyboard and quickly close the PowerBook computer's display.

Step 4

The computer will then start up as if the external monitor is the only display and the PowerBook display will not be active. Because the PowerBook display is not generating any heat, there is no danger of the display distorting if you leave it closed.

8) Question: Do I need a screen saver on my PowerBook?

Answer: Screen savers are generally for entertainment purposes and do not serve any protective function for PowerBook displays or the Cathode Ray Tube (CRT)-type monitors used with most desktop computers. However, if a PowerBook computer's screen is left on with the same image for several weeks, it is possible that the image will "burn" into the screen. Do not leave for a lengthy vacation and forget to turn your PowerBook off.

9) Question: What are the differences in the two PowerBook Small Computer Systems Interface (SCSI) cables made by Apple?

Answer: There are two PowerBook SCSI cables available from Apple:

The HDI-30 SCSI System Cable (M2538LL/A) - This cable is for attaching SCSI devices such as CD-ROM drives, Syquest drives, and scanners to the PowerBook computer.

The HDI-30 SCSI Disk Adapter Cable (M2539LL/A) - This cable is used to connect the PowerBook computer as a SCSI device to another Macintosh computer.

10) Question: I am trying to connect a SCSI device to my PowerBook computer. However, when I start up the PowerBook computer, a diamond icon with a number in the middle of it appears on my screen.

Answer: You are most likely using the wrong SCSI cable. You should be using the HDI-30 SCSI System Cable (M2538LL/A), which is a light gray color and only has 29 pins (there is a pin missing). You are probably using the HDI-30 SCSI Disk Adapter cable (M2539LL/A) which is dark gray and has all 30 pins. The HDI-30 SCSI Disk Adapter cable puts the PowerBook computer into SCSI disk mode allowing it to be attached to a desktop computer as a SCSI device and resulting in the diamond icon with the SCSI ID number in the middle appearing on the screen.

11) Question: I am trying to connect my PowerBook computer as an external hard drive (SCSI Disk Mode) to another Macintosh computer. When I turn on my PowerBook computer, I get a flashing question mark or a "Sad Mac" instead of the diamond icon with a SCSI ID number.

Answer: You may have the wrong cable. Use the Apple HDI-30 SCSI disk adapter cable, part number M2539LL/A, in conjunction with an Apple SCSI System Cable appropriate to your other Macintosh along with proper SCSI termination.

12) Question: What is SCSI disk mode?

Answer: SCSI disk mode is a method of connecting a capable PowerBook computer to another Macintosh computer so that it is accessed as if it were an external hard drive. This method can be preferable to file sharing because it is somewhat easier, and much faster.

13) Question: Which PowerBook computer models can accomplish SCSI disk mode?

Answer: The SCSI disk mode feature exists on all PowerBook computer models except the PowerBook 140, 145, 145B, 150, and 170 computers. The PowerBook 200 and 2300 series computers require a MiniDock to accomplish SCSI disk mode.

14) Question: What are the instructions for connecting a PowerBook computer in SCSI disk mode?

Answer:

Step 1

Make sure you have a PowerBook computer that is capable of SCSI disk mode and the HDI-30 SCSI Disk Adapter cable (M2539LL/A). You will also need an Apple terminator (M3503LL/A) and a SCSI system cable (M0206, or M2538LL/A if the other computer is a PowerBook).

Step 2

Use the PowerBook or PowerBook Setup control panel to set the PowerBook to a SCSI ID not currently in use on the SCSI chain of the other Macintosh.

Step 3

Shut down both computers.

Step 4

Connect the HDI-30 cable to the back of the PowerBook computer. Connect the terminator to the end of the HDI-30 cable. Connect the HDI-30 cable with terminator to the last SCSI device on the chain, if any. If you do not have any other external SCSI devices, connect the HDI-30 cable with terminator to the SCSI system cable, then connect the SCSI system cable to the back of the other Macintosh computer.

Your setup should look like this:

PowerBook -> HDI-30 SCSI Disk Adapter cable -> Terminator -> External SCSI chain
if there is one -> SCSI system cable -> Other Macintosh computer

Step 5

Turn on the PowerBook computer. After a moment you should see a SCSI symbol (diamond with the SCSI ID number in the middle) on the screen. If you have a 500 series PowerBook computer you may not see this icon until after the next step.

Step 6

Turn on the other Macintosh computer. After starting up, the PowerBook

computer's hard drive should appear on the desktop.

You can then transfer files back and forth as if the PowerBook computer were an external hard drive.

15) Question: Which PowerBook computer models can use an external monitor?

Answer: External video can be accomplished on all PowerBook computer models except the PowerBook 100, 140, 145, 145B, 150, and 170. The PowerBook 200 and 2300 series computers require a MiniDock or Duo Dock to use external monitors. External video on the PowerBook 190 computer is optional and can be upgraded after purchase.

16) Question: What should I use to clean the PowerBook computer?

Answer: Clean the computer's outside surfaces with a damp (not wet) cloth. Clean the screen with soft, lint-free paper or cloth and a mild glass cleaner. Do not spray the glass cleaner directly onto the screen. Sometimes humidity or condensation may cause moisture to gather on the trackpad (if your PowerBook model has a trackpad). If this happens, gently wipe the trackpad with a clean cloth before you use it.

To clean the trackball assembly, follow these steps:

Step 1

Remove the trackball retaining ring by turning it counterclockwise until it pops out (about 1/4 turn). You don't need tools for this, you can just press against the two small ridges on the ring with your fingernails.

Step 2

Lift the retaining ring and trackball out of its cavity.

Step 3

Locate the small rubber rollers at the left and bottom sides of the trackball cavity. Depending on your model, they may look like small rings or wheels.

Step 4

Use any reasonably clean, blunt object (such as your finger or a cotton swab) to wipe off the rollers. Do not use any liquid, including any amount of cleaning fluid or water, inside the computer.

Step 5

Locate the three white or red bearings located at approximately clockwise 4:00, 7:00, and 11:00 in all PowerBooks except the PowerBook 100, which has three black posts instead of bearings. Using a fingertip, dry cotton swab, or other blunt object, clean them of any debris.

Step 6

Replace the trackball and the retaining ring.

17) Question: Sometimes I cannot seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook computer models that have only one serial port (190, 200, 500, 2300, and 5300 series), the serial port is mapped as a modem port. Under normal conditions this is not a problem - the internal modem can be used at the same time as a serial device such as a printer is being used.

The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to Internal, Compatible, or "Use internal modem instead of modem port". The location of this setting will depend on what version of the modem and system software you have. When the PowerBook computer is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there is an update.

18) Question: Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

Answer: As discussed in the previous question, a PowerBook computers with a single serial port (190, 200, 500, 2300, and 5300 series) introduces some variables to serial printing. Three things must be true to print to a serial printer with a single serial port PowerBook computers:

- AppleTalk must be set to inactive in the Chooser or something other than LocalTalk must be selected in the Network control panel.
- If you have an internal modem you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to External, Normal, or uncheck "Use internal modem instead of modem port" (see above). The location of this setting will depend on what version of the modem and system software you have.
- When selecting the serial printer in the Chooser, you must select the modem port or the combined printer/modem port. Do not select the printer port.

19) Question: Is it safe to move my PowerBook computer while it is on?

Answer: If the hard drive is spinning and there is a jolt to the computer, the head can crash into the platter and cause the hard drive to be damaged. This is not likely to happen while, say, walking your PowerBook computer from the

kitchen to the living room. It is not suggested that you use the PowerBook computer in a truck traveling over a dirt road or other instances where jarring or bumping could occur.

In general, it is okay to transport PowerBook computers while they are asleep. When moving a sleeping computer, there is a slight danger of accidentally hitting a key that would wake up the computer and also power-up the hard disk. Make sure that your PowerBook computer is solidly closed so it cannot accidentally start up.

20) Question: Can I install a hard drive from my PowerBook 180c into my PowerBook 230 (Duo)?

Answer: No, all PowerBook 200 and 2300 series computers require a hard drive with a height of 17 millimeters (mm). All other PowerBook computers require a hard drive with a height of 19 mm.

Attempting to put a taller 19 mm hard drive into a PowerBook 200 or 2300 series computer will not work because the drive is physically too tall.

All PowerBook computers, except the 200 and 2300 series (Duos), can operate with either height drive, however they come with a 19 mm height hard drive. If you replace a hard drive with a different (shorter) height one it will require a different hard drive bracket. Apple does not offer any special brackets for swapping hard drives.

If you want to remove a hard drive from a PowerBook computer and install it in an external case, there are third party vendors that offer kits including cables and a power supply. Apple does not offer any such kits.

21) Question: Where else can I go for answers about PowerBook computers?

Answer: If you have not done so already, check the other PowerBook-related FAQ documents in Apple's Technical Information Library (TIL). This library is located on the Internet at <<http://til.info.apple.com/>> This is Apple's official tech support library and contains thousands of technical articles.

22) Where I can get the latest Apple software updates online for my PowerBook?

- On the Internet at the following sites:
 - Worldwide Web: <http://www.info.apple.com/swupdates>
 - ftp:
ftp://ftp.info.apple.com/Apple_Support_Area/Apple_SW_Updates/US/Macintosh/PowerBook/
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

QuickTime Conferencing: ISDN Termination Type/Mode (12/95)

Revised: 12/19/95
Security: Everyone

QuickTime Conferencing: ISDN Termination Type/Mode (12/95)

=====

Article Created: 19 December 1995

TOPIC -----

This article describes an issue with ISDN lines and the line termination type/mode that is best suited to video teleconferencing.

DISCUSSION -----

If an ISDN line has been installed to do QuickTime Conferencing from a Macintosh with an installed H.320 card, be sure your ISDN provider has provided the correct line termination type/mode. The ISDN provider may supply your ISDN line with generic type/mode termination, when video conferencing type/mode termination is required.

To illustrate, an ISDN line to be used with QuickTime Conferencing was supplied, and after many attempts (different configurations, computers, H.320 cards, and phone numbers) this line would not work properly.

In an attempt to resolve this issue, the system was connected to a known working ISDN line to check the system's configuration and hardware, and everything worked properly. The ISDN provider, of the non-working line, was contacted and the line termination was changed from type/mode "D" (generic) to "A". The ISDN line now works properly.

Power Macintosh: Built-in Ethernet 802.3u Compliant (12/95)

Revised: 12/19/95
Security: Everyone

Power Macintosh: Built-in Ethernet 802.3u Compliant (12/95)

=====

Article Created: 19 December 1995

TOPIC -----

Is the built-in Ethernet on the Power Macintosh 6100, 7100, 8100, 7200, 7500, 8500, and 9500 computers IEEE 802.3u compliant?

DISCUSSION -----

The built-in Ethernet, on the computers you mentioned, is not IEEE 802.3u compliant. IEEE 802.3u is the specification for Media Access Control (MAC) Parameters, Physical Layer, Medium Attachment Units, and Repeater for 100 Mbps Operation, Type 100BASE-T.

In order to be compliant with this specification, you will need to provide a Media Independent Interface (MII), which may have an auto-negotiation feature to determine speed capabilities of the device (host). Apple provides no such MII at this time. You will have to either purchase a card capable of auto-negotiation, or a hub capable of switching both 10BASE-T and 100BASE-T.

PowerPC PowerBook Computers: Frequently Asked Questions (4/97)

Revised: 5/1/97
Security: Everyone

PowerPC PowerBook Computers: Frequently Asked Questions (4/97)

=====

Article Created: 19 December 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about the PowerPC PowerBooks. This discussion includes the PowerBook 5300 series, 2300 series, 500 series upgraded to PowerPC, and 200 series upgraded to PowerPC.

DISCUSSION -----

- 1) What is different about the PowerPC PowerBooks compared to other PowerBooks?
- 2) I forgot the password that I entered into my Password Security control panel and now I cannot get into my computer. Is there anyway to bypass the password?
- 3) If the PowerBook 5300/2300/190 series computers do not come with system disks, how do I restore my software in the case of a hard drive crash?
- 4) Why is it that my Macintosh Quadra 800 seems faster than my PowerBook 5300 (or any PowerPC PowerBook) when running some applications?
- 5) How do the PowerBook 5300 series computers implement external video?
- 6) What is special about the SVGA display that comes with the PowerBook 5300ce computer?
- 7) Can the PowerBook 5300/190 series computers use two batteries simultaneously?
- 8) Does the PowerBook 5300ce computer support thousands of colors on both the internal display and an external monitor?
- 9) Will the RAM from my PowerBook 200/500 series computer be compatible if I upgrade to the PowerPC 603e processor?

10) Sometimes I cannot seem to use my internal modem and print at the same time. Why is this?

11) Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

12) I am trying to reset the parameter RAM (PRAM) on a PowerBook 5300 series computer but it does not seem to be working. What is the correct way to "zap" the PRAM on a PowerBook 5300 series computer?

13) Do the PowerPC PowerBook computers support PlainTalk Speech Recognition?

14) Can I use an external microphone with a PowerBook 5300 series computer?

15) I have hooked up an external CD-ROM drive to my PowerBook 5300 series computer and I am playing an audio CD. When I bring up the AppleCD Audio Player I can see the numbers moving but there is no sound coming through the speakers, although I can hear the sound of regular multimedia CD-ROM discs fine. Can I play an Audio CD through the internal speakers?

16) My PowerBook computer's display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?

17) Do the PowerBook 5300 and 2300 series computers support the GeoPort?

18) Are Apple's current docking products, modems, and RAM still compatible with a PowerBook 200 series computer which has been upgraded to PowerPC?

19) Will my RAM and internal modem still be compatible after I upgrade my PowerBook 500 series computer to the PowerPC 603e processor?

20) Some PowerPC PowerBook computers come with 8, 16, 20, or 32 MB of RAM. Which models come with the RAM card slot filled?

21) What are the differences in the trackpads that come on the different PowerPC PowerBook computers?

22) Sometimes when I try to use the trackpad, the cursor jumps around uncontrollably. What causes this?

23) My PowerBook 5300 series computer will not turn on at all. There is no reaction whatsoever when I press the power button. Is there any thing I can try before I decide I have to have it serviced?

24) Where else can I go for answers about PowerBook computers?

25) Where can I get the latest software updates for my PowerBook?

DISCUSSION -----

1) Question: What is different about the PowerPC PowerBooks compared to other PowerBooks?

Answer: The PowerBook 5300, 2300, and upgraded 500/200 series PowerBook computers use a PowerPC 603e microprocessor which runs at 100 MHz (the PowerBook 5300ce runs at 117MHz). This processor is extremely fast compared to other PowerBook models (which use a 680x0 processor) when used with applications that are optimized for PowerPC. These applications are usually referred to as "native" or "fat binary." An application that is "fat binary" contains code for PowerPC and 680x0 processors. A native or fat binary application can run up to 5 times faster on a PowerPC processor than it would on a 680x0 processor. The PowerPC 603e also has an integrated FPU and a 32k cache.

2) Question: I forgot the password that I entered into my Password Security control panel and now I cannot get into my computer. Is there anyway to bypass the password?

Answer: The password protection software bundled with the 5300/2300/190 series PowerBook computers is driver level security and cannot easily be bypassed. In fact, you will not even be able to reformat the drive if you do not have the password. If you do forget the password, take the PowerBook to an Apple-authorized dealer. The dealer can call our dealer help line and get a special code to bypass the security and reset your password. The dealer may charge a fee for this service, since it is a software issue, not a hardware issue, and they will probably ask for some verification that the PowerBook is your computer.

3) Question: If the PowerBook 5300/2300/190 series computers do not come with system disks, how do I restore my software in the case of a hard drive crash?

Answer: The PowerBook 5300/2300/190 series computers come with a utility called Floppy Disk Maker that you can use to back up the bundled software on the hard drive and/or make a functional set of system disks.

A "full" backup will require between 22 and 24 high density floppy disks and back up the following software:

- Apple Remote Access (1 disk)
- PowerBook Extras (3 disks) - Includes Apple IR File Exchange, Disk Image Mounter, Floppy Disk Maker, Password Security, Eric's Ultimate Solitaire Sampler, Spin Doctor, Super Maze Wars, and HyperCard Player.
- PowerTalk (2 disks)
- QuickDraw GX (4 disks)
- System Software (11-13 disks)
- WorldScript (1 disk)

Note that Floppy Disk Maker will NOT back up the following software:

- Adobe Acrobat Reader
- MacLinkPlus

The appropriate company should be contacted if any of the above software is lost or damaged.

A "minimum" backup of the system software will require between 11 and 13 high density floppy disks and will create a full set of system disks.

The computer will prompt you to make these disks every time it is turned on until the disks are made.

4) Question: Why is it that my Macintosh Quadra 800 seems faster than my PowerBook 5300 (or any PowerPC PowerBook) when running some applications?

Answer: You will only see a performance increase on the PowerPC (PPC) PowerBook when using native (optimized for the PowerPC) application programs. If you are using older programs written for the 680x0 processor, the PPC PowerBook computer must translate every instruction into a PowerPC instruction before executing it. When the computer is running in this mode, it is said to be in emulation mode. Since the System 7.5 Finder is mostly 680x0 code, Finder operations such as opening and closing windows may not be much faster than a 68040 computer such as a Quadra 800.

5) Question: How do the PowerBook 5300 series computers implement external video?

Answer: The PowerBook 5300 series computers implement a Processor Direct Slot (PDS) video card. This video card provides an external video connector on the rear panel of the computer. This video card provides 8-bit color at resolutions up to 832x624 using 512k VRAM. This card can be replaced by a third-party video card that offers more colors at higher resolutions, networking cards, or other cards that typically run through a PDS slot.

6) Question: What is special about the SVGA display that comes with the PowerBook 5300ce computer?

Answer: The SVGA display that comes with the PowerBook 5300ce computer offers a higher screen resolution than any other previous PowerBook computer models. It displays 800x600 pixels at thousands of colors.

7) Question: Can the PowerBook 5300/190 series computers use two batteries simultaneously?

Answer: Yes, the PowerBook 5300/190 expansion bay (where the floppy disk drive normally is) can accept a battery. Since the expansion bay does not pass AC power through, any battery used through the expansion bay will require its own power supply for charging.

8) Question: Does the PowerBook 5300ce computer support thousands of colors on both the internal display and an external monitor?

Answer: No. The PowerBook 5300ce computer has 1 MB of Video Ram (VRAM) dedicated to the internal display providing thousands of colors at an 800x600 (SVGA)

resolution. Like all PowerBook 5300 series computers, the 5300ce computer comes with 512k VRAM for external monitors, providing 256 colors at an 832x624 resolution. The external video card can be upgraded to 1 MB VRAM with a third-party video card.

9) Question: Will the RAM from my PowerBook 200/500 series computer be compatible if I upgrade to the PowerPC 603e processor?

Answer: Yes, in fact you will automatically receive a 4 MB RAM upgrade since the PowerPC 603e logic board has 8 MB of RAM soldered on it, while the existing 200/500 logic boards have only 4 MB. So for instance, if you have a PowerBook 540c with 12 MB before the upgrade, you will have 16 MB after the upgrade.

10) Question: Sometimes I cannot seem to use my internal modem and print at the same time. Why is this?

Answer: On most PowerBook computer models that have only one serial port (190, 200, 500, 2300, and 5300 series computer), the serial port is mapped as a modem port. Under normal conditions this is not a problem - the internal modem can be used at the same time as a serial device such as a printer is being used. The exception to this is if you are using a communications program that does not use the Apple Communications Toolbox (CTB). If this is the case, you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to Internal, Compatible, or "Use internal modem instead of modem port". The location of this setting will depend on what version of the modem and system software you have. When the PowerBook is set like this, the serial port cannot be used with serial devices. However, it can be used with LocalTalk devices.

The vast majority of communications programs that are developed for Macintosh right now will use the CTB. If you find that you have an older communications program, contact the manufacturer to see if there's an update.

11) Question: Sometimes I get errors when printing to my StyleWriter (or any serial printer). Why is this?

Answer: As discussed in the previous question, a PowerBook with a single serial port (190, 200, 500, 2300, and 5300 series computers) introduces some variables to serial printing. Three things must be true to print to a serial printer with a single serial port PowerBook:

- * AppleTalk must be set to inactive in the Chooser or something other than LocalTalk must be selected in the Network control panel.

- * If you have an internal modem you will need to respectively set the PowerBook, PowerBook Setup, or Express Modem control panel to External, Normal, or uncheck "Use internal modem instead of modem port" (see above). The location of this setting will depend on what version of the modem and system software you have.

- * When selecting the serial printer in the Chooser, you must select the modem port or the combined printer/modem port. Do not select the printer port.

12) Question: I am trying to reset the parameter RAM (PRAM) on a PowerBook 5300 series computer but it does not seem to be working. What is the correct way to "zap" the PRAM on a PowerBook 5300 series computer?

Answer:

**** WARNING **** Be aware that resetting the PRAM will reset such settings as the sound volume, trackpad speed, and screen brightness to their default value, and will purge the contents of a RAM disk if you are using one.

To reset the PRAM on a PowerBook 5300 series computer, restart the computer and hold down the Command (Apple), Option, P, and R keys. Wait for the computer to make its startup chime twice. Then you may release the keys. At this point the computer may shut down or continue to start up. If it shuts down, use the small power button on the back to restart the computer.

13) Question: Do the PowerPC PowerBook computers support PlainTalk Speech Recognition?

Answer: PlainTalk Speech Recognition will work with a PowerBook 5300 or 2300 series computer if you install PlainTalk version 1.4.1 and the English Speech Recognition system extension version 1.5. You can only use Speech Recognition with the built-in microphone.

Step 1

Download the PlainTalk software from the Web at the following URL:

<http://speech.apple.com/speech/ptk/ptk.html>

Step 2

Install PlainTalk 1.4.1 (English Speech Recognition and Text-to-Speech).

Step 3

Replace the Speech Recognition extension 1.4.1 with version 1.5.

14) Question: Can I use an external microphone with a PowerBook 5300 series computer?

Answer: The audio input port on the PowerBook 5300 series computers is a line-level input. This means that it requires an audio signal with a strength of at least 1 volt peak-to-peak. The PlainTalk microphone will not work with any existing PowerBooks. If you want to use an external microphone, you will need a microphone that outputs a line-level signal. Note that battery powered microphones do not necessarily provide a line-level signal.

Alternatively, you can run a standard microphone through a stereo system or a pre-amp that outputs a line-level signal.

15) Question: I have hooked up an external CD-ROM drive to my PowerBook 5300 series computer and I am playing an audio CD. When I bring up the AppleCD Audio Player I can see the numbers moving but there is no sound coming through the speakers, although I can hear the sound of regular multimedia CD-ROM discs fine. Can I play an Audio CD through the internal speakers?

Answer: There is not a direct connection between the SCSI port and the speakers, so direct play-through of audio CDs is not readily possible. Typically, only Macintosh computers which have an internal CD-ROM drive can play-through audio CD sound to the internal speakers. You will need to connect external speakers to the external CD-ROM drive to hear the audio CD sound.

16) Question: My PowerBook computer's display is blurry or sometimes has shadowing and ghosting effects. What can I do to correct this?

Answer: The technology used on the passive-matrix displays is susceptible to shadowing and ghosting, since it does not individually address each pixel on the display. Gray-scale passive-matrix displays are particularly susceptible to these symptoms. The PowerBook 100, 140, 145, 145B, 150, 160, 165, 210, 230, 520, 190, and 5300/100 all use a gray-scale passive-matrix display.

Some suggestions to reduce the effects of the shadowing:

- * Adjust the brightness and contrast settings of the display. Usually a lighter contrast setting will look better.

- * Use a darker desktop pattern. The effects of the shadowing will not be as apparent with the darker background.

- * Open the Monitors control panel and select "Black & White" instead of 16 Shades of Gray.

Although these tips can help mitigate the effects of the shadowing, some amount of screen anomalies will always be present on gray-scale passive-matrix displays.

17) Question: Do the PowerBook 5300 and 2300 series computers support the GeoPort?

Answer: No, the PowerBook 5300 and 2300 series computers use a standard serial port with 8 pins. The GeoPort requires a ninth pin to draw power from the computer.

18) Question: Are Apple's current docking products, modems, and RAM still compatible with a PowerBook 200 series computer which has been upgraded to PowerPC?

Answer: Most, if not all docking products, internal modems, and RAM used with a PowerBook 200 series computer should still be compatible after the PowerPC 603e upgrade.

19) Question: Will my RAM and internal modem still be compatible after I upgrade my PowerBook 500 series computer to the PowerPC 603e processor?

Answer: The existing RAM card and internal modem should be compatible with the PowerPC 603e upgrade.

20) Question: Some PowerPC PowerBook computers come with 8, 16, 20, or 32 MB of RAM. Which models come with the RAM card slot filled?

Answer: Only the PowerBook 5300ce/117 32/1.1 GB and the PowerBook 2300c 20/1.1 GB come with RAM cards installed in their RAM slots. The 5300ce/117 32/1.1 GB comes with a 16 MB RAM card and 16 MB soldered on the logic board. The PowerBook 2300c 20/1.1 GB comes with a 12 MB RAM card and 8 MB on the logic board. All other models come with either 8 MB or 16 MB soldered on to the logic board, but no memory in the RAM card slot which is available for future expansion.

21) Question: What are the differences in the trackpads that come on the different PowerPC PowerBook computers?

Answer: The PowerBook 2300 and 190 series computers come with a "clickable" trackpad. With this kind of trackpad you can use the pad itself to click, double click, and drag, therefore never having to use the clicker. Because the PowerBook 5300 series computers were designed and implemented at an earlier date, they do not have the features of the clickable trackpad.

22) Question: Sometimes when I try to use the trackpad, the cursor jumps around uncontrollably. What causes this?

Answer: The trackpad works on a principal called coupling capacitance. As your finger moves over the surface, the trackpad evaluates the change in capacitance between two layers of measurement electrodes built into the surface of the trackpad.

The most common cause of a jumping trackpad cursor is moisture interference. If you have sweaty hands or if moisture collects on the pad, this may confuse the trackpad. Wiping off the trackpad with a cloth or tissue will usually fix this problem. If you find that it continues to get wet you may want to consider purchasing a teflon or mylar pad to fit over the pad to prevent the moisture from having direct contact with the pad. Before installing the pad, make sure the trackpad is clean. You can use a mild glass cleaner sprayed onto the cloth, not onto the trackpad itself.

Make sure only one part of your finger is touching the pad. You will not be able to use a pen or other object, it is designed to work with your finger. Also make

sure that you are not resting your wrist on or very close to the pad. The trackpad may interpret this as your wrist touching it and make the cursor move in that direction. If you suspect either of these is causing the cursor's behavior, try raising your wrist in the air and only touch the pad with the tip of your finger. If the symptom goes away then you know that one of the above is the cause and you should adjust the position of your wrist and or finger.

Oil or lotion can cause the same problem. Either do not use hand lotion, or consider purchasing a teflon or mylar pad to protect the pad. Before installing the teflon pad, make sure the trackpad is clean.

Jewelry may also cause interference. Try removing rings or bracelets and see if the jumping or erratic behavior disappears.

23) Question: My PowerBook 5300 series computer will not turn on at all. There is no reaction whatsoever when I press the power button. Is there any thing I can try before I decide I have to have it serviced?

Answer: It is possible that the power manager is corrupted and is not letting the PowerBook turn on. To reset the power manager, follow these steps:

Step 1

Remove the power adapter and battery from the computer.

Step 2

Push the reset button in the back of the computer and hold it for 30 seconds.

Step 3

Make sure the AC adapter is connected to a live AC outlet then connect the AC adapter to the back of the computer.

Step 4

Push the reset button in back again, but just briefly - the computer should power on. If it does not power on, push the main power button on the keyboard.

To prevent this from happening in the future, make sure the AC adapter is "live" at all times when connected to the PowerBook.

If the above procedure does not help, the PowerBook will need to be serviced.

24) Question: Where else can I go for answers about PowerBook computers?

Answer: If you have not done so already, check the other PowerBook-related FAQ documents in Apple's Technical Information Library (TIL). This library is available on the Internet at <<http://til.info.apple.com/>> and contains thousands of technical articles.

25) Where can I get the latest software updates for my PowerBook?

All Apple software updates are posted to the Internet, America Online and CompuServe:

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP

Color LaserWriter 12/600 PS: Using with NetWare 3.1x (12/95)

Revised: 12/19/95
Security: Everyone

Color LaserWriter 12/600 PS: Using with NetWare 3.1x (12/95)

=====

Article Created: 19 December 1995

TOPIC -----

This article contains information on how to setup a NetWare 3.1x server to print to an Apple Color LaserWriter 12/600 PS printer.

DISCUSSION -----

These instructions use the Apple Printer Utility, which comes with the Apple Color LaserWriter 12/600 PS printer. There are two versions of the Apple Printer Utility, one of a Macintosh computer, and another for Windows-based computers. You may use either version.

Setting Up the Color LaserWriter 12/600 PS Printer

=====

Step 1

Generate a startup page by turning the printer off, then back on.

Step 2

using the Supervisor account, Login to a Novell file server from a MS-DOS client.

Step 3

At the MS-DOS prompt, type PCONSOLE, and press Enter (or Return).

Step 4

Use the arrow keys to highlight Change Current File Server in the Available Options menu, and press Enter.

Step 5

If the Novell file server you want the Color LaserWriter 12/600 PS to connect to is not already listed, press the Insert key and select the file server you want to use.

Step 6

Under the Available Options menu, use the arrow keys to highlight Print Server Information and press Enter.

Step 7

Press the Insert key, then enter the PServer name (provided on the printer startup page), and press Enter.

Note:

PServer names with spaces will not work with a NetWare 3.x server. If the PServer name on the printer startup page has spaces, you need to follow the steps listed in the Verify or Change PServer Name section of this article to change or remove them.

Step 8

Under the Available Options menu, use the arrow keys to highlight Print Queue Information, and press Enter.

Step 9

In the Print Queue list, press the Insert key to create a new print queue on the NetWare server.

Step 10

At the prompt, type the new queue name and press Enter.

Note:

This is the descriptive name people will use to print to the Apple Color LaserWriter 12/600 PS printer.

Step 11

Select the name of the queue you specified in Step 10 and press Enter.

Step 12

Under the Queue Information menu, highlight Queue Servers and press Enter.

Step 13

In the Queue Servers list, press Insert and select the Color LaserWriter 12/600 PS printer's PServer name you entered in Step 7.

Step 14

Turn the printer off, then on. Give the printer a minute or so to attach to the server.

Step 15

Check that the printer is attached by going into the Queue Information menu, highlighting Currently Attached Servers, and pressing Enter. Whenever the PServer attaches to the NetWare 3.x server, the PServer name appears in the Currently Attached Servers list.

Troubleshooting Steps

=====

If the Color LaserWriter 12/600 PS printer does not attach to the NetWare file server, first verify the PServer name. If the printer still doesn't attach to the file server, check the routing.

Verify or Change PServer Name

Step 1

Run the Apple Printer Utility and select your Color LaserWriter 12/600 PS Printer in the Printer Selector window.

Note:

If your using the Windows version of the Apple Printer Utility, you will only see IPX printers on your network.

Step 2

Open up the Communication Configuration by clicking on the triangle to the left.

Step 3

Open up the NetWare Configuration by clicking on the triangle to the left it.

Step 4

Verify that the PServer option is marked; if not, mark it.

Step 5

Verify that the Print Server Name is the same as the PServer name you entered in step 7 of Setting Up the Color LaserWriter 12/600 PS Printer procedures above. If the name is not correct, follow the procedures in Setting Up the Color LaserWriter 12/600 PS Printer and enter the correct name.

Note:

If the PServer name contains a space, change it to an underscore, then modify the PServer name on the NetWare server.

Step 6

Click the Send button if it is highlighted. If the Send button is not highlighted, then you did not make a noticeable change to the printer name in Step 5.

Step 7

Choose Restart Printer from the Utilities menu. Give the printer a minute or so to attach to the server.

Step 8

Use PCONSOLE to verify that the Color LaserWriter 12/600 PS printer attached to the NetWare server.

Note:

You verify the printer is attached by going into the Queue Information menu, selecting the queue for your Apple Color LaserWriter 12/600, and choosing Currently Attached Servers. Whenever your Color LaserWriter 12/600 PS PServer attaches to the NetWare 3.x server, its PServer name appears in the Currently Attached Servers list.

Check Routing Issues

Step 1

Activate the TRACK ON option on the NetWare server.

Step 2

Turn the printer off, then on.

Step 3

Watch the router tracking screen for a "get nearest server" request from the Apple Color LaserWriter 12/600 PS printer. Pause the router tracking screen if needed. The get nearest server message should appear on the screen about the same time as the test page prints.

Step 4

If the PServer name does not appear on the screen, you probably have a routing problem.

Step 5

If the PServer name does appear on the screen, check the name and verify that it is the correct spelling.

Step 6

If the spelling is correct, go back and repeat/verify the Setting Up the Color LaserWriter 12/600 PS Printer procedures.

Step 7

If the spelling is not correct, go back and repeat the Verify or Change PServer Name procedures.

Power Macintosh 7500 & 8500: Using a DAV Card (12/95)

Revised: 10/14/96
Security: Everyone

Power Macintosh 7500 & 8500: Using a DAV Card (12/95)

=====

Article Created: 19 December 1995

TOPIC -----

I have a Power Macintosh 8500 computer with a third-party DAV (Digital Audio/Video) card installed. Ever since installing the DAV card the images on the screen appear distorted.

DISCUSSION -----

Apple is aware of and has resolved this DAV issue, which affects a small number of Power Macintosh 7500 and 8500 computers. For assistance resolving this issue, contact an Apple-authorized service provider.

AppleVision 1710AV Display: Dots Per Inch (DPI) Settings (12/95)

Revised: 12/20/95
Security: Everyone

AppleVision 1710AV Display: Dots Per Inch (DPI) Settings (12/95)

=====

Article Created: 20 December 1995

TOPIC -----

This article provides a chart listing the Dots per inch (DPI) of the AppleVision 1710AV Display at all of its possible resolutions.

DISCUSSION -----

The following chart is for the AppleVision 1710AV Display. It shows the front of screen DPI when the display image is set up with a 300mm by 225mm raster image (Apple specifications). This size image leaves about 1/2 to 3/4-inch black border between the raster edge and the front bezel plastics. Most resolutions have the same horizontal and vertical DPI except the 1280x1024 resolution.

Begin_Table

Resolution	Dots per inch
-----	-----
640x480	54 (H & V)
800x600	68 (H & V)
832x624	70 (H & V)
1024x768	87 (H & V)
1152x870	98 (H & V)
1280x960	108 (H & V)
1280x1024	108 horizontal, 116 vertical
1600x1200	135 (H & V)

End_Table

At Ease 3.0.x: Trouble Printing from DOS Environment (1/96)

Revised: 1/5/96
Security: Everyone

At Ease 3.0.x: Trouble Printing from DOS Environment (1/96)

Article Created: 20 December 1995
Article Reviewed/Updated: 5 January 1996

TOPIC -----

I am having problems when printing from my Power Macintosh 6100 DOS Compatible using At Ease 3.0.x. If I try to print a document from the DOS environment while At Ease is in the Restricted Finder, I get an error stating "DOS Compatibility error has occurred. Cannot create PC Print Spool file. Verify there is enough disk space." If At Ease is turned off, the computer prints with no problem.

DISCUSSION -----

In order to print from the DOS environment on a Macintosh computer with a DOS compatibility card, the At Ease user must have access to the PC Print Spooler Application.

Without access to this application, two different error messages may occur when trying to print from the DOS environment with At Ease turned on. The first one mentioned above occurs if the user launched the DOS card from At Ease's Restricted Finder. The second message "There is not enough memory to run PC Print Spooler" appears if the user launched the DOS card from the At Ease panels. In both cases, adding the PC Print Spooler to the DOS Environment user's setup allows the user to print.

The same is true for using the cross platform clipboard. The At Ease user must have access to the PC Clipboard application in order to copy and paste between the Macintosh environment and the DOS environment.

If you want to allow printing, and cross-platform copy and paste functionality for your DOS environment At Ease users, use At Ease Setup to add the applications PC Print Spooler and PC Clipboard to your setup.

PowerBook 500 Series: Read Me (12/95)

=====

Article Created: 20 December 1995

TOPIC -----

This article contains the ReadMe file included with the PowerBook 500 Series computers.

DISCUSSION -----

Important Information About Your
PowerBook 520, 520c, 540, or 540c Computer

Congratulations on purchasing your PowerBook 500 series computer. This document adds to and updates the information in the manuals that came with your computer. It is a good idea to read this document now, and keep a copy handy for future reference.

If your PowerBook is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

If you are using System 7.1, Read this Section
=====

The PowerBook 500 Series Disks

The PowerBook 500 series disks that came with your PowerBook contain system software for the PowerBook 520, 520c, 540, and 540c computers. If you ever need to reinstall system software, start by using the Install Me First disk.

System Enablers

The system software on your computer includes a System Enabler file that your computer uses when it starts up. If the System Enabler for the PowerBook 500 series is not present in the System Folder, your computer will not start up. If your computer does not start up, try reinstalling the system software, following the directions in the Getting Started manual that came with your computer. Be sure to use the PowerBook 500 series disks that came with your computer.

Reinstalling System Software

When reinstalling system software, always follow the directions in the Getting Started manual that came with your computer. Don't install system software files (especially control panels) by dragging icons; doing so can cause your computer to work improperly.

If you install your PowerBook 500 series system software onto a hard drive that will be used with other computers, select "newer" software when given a choice during the installation process.

Installing System 7.5

Your PowerBook comes with Macintosh System 7.5 on the hard disk ready to be installed. Macintosh System 7.5 includes system software version 7.5, QuickDraw GX, and PowerTalk. You install each of these components separately.

Macintosh System 7.5 is on your hard disk in a folder named System 7.5. For more information, see the Install 7.5 Read Me. Also see the Macintosh System 7.5 Upgrade Guide that came with your PowerBook.

You can install system software version 7.5 on a PowerBook with 4 MB of memory (RAM). However, you'll need more memory to use some application programs. Apple recommends that you expand your PowerBook's memory to at least 8 MB before you install System 7.5. You can purchase a memory expansion card at any Apple-authorized dealer.

Installing QuickDraw GX and PowerTalk

You need at least 8 MB of memory to install QuickDraw GX and PowerTalk. You cannot install QuickDraw GX and PowerTalk on PowerBooks with less than 8 MB of memory installed.

If you are Using System 7.5, Read this Section

=====

Using QuickDraw GX with a Fax Modem

If you installed QuickDraw GX and you have a fax modem, you need a QuickDraw GX modem driver in order to send faxes. Contact the modem vendor to obtain the QuickDraw GX driver.

If you have installed QuickDraw GX and do not yet have the QuickDraw GX modem driver, you can temporarily turn off QuickDraw GX and use your previous fax modem driver. To turn off QuickDraw GX:

Step 1

Hold down the Space bar while you choose Restart from the Special menu to restart your PowerBook. Continue to hold down the Space bar until the Extensions Manager appears on the screen.

Step 2

Click the QuickDraw GX extension to remove the check beside it.

This prevents the QuickDraw GX software from loading.

Step 3

Click the close box in the Extensions Manager dialog box to resume startup.

Your fax modem should work normally. You won't be able to use any QuickDraw GX features until you turn the extension back on again.

All PowerBook Users, Read this section

=====

Charging Your Battery

Apple recommends that you connect the power adapter to your computer and let the battery (or batteries) charge overnight when you first unpack your computer. (The battery may have been depleted between the time it was charged at the factory and the time you purchased the computer.)

If you have two batteries installed in your PowerBook, you can maximize battery life by swapping them approximately once a month. Before you can swap PowerBook 500 series batteries, you must either shut down the computer or connect the power adapter if the computer is on. Then simply remove both batteries and reinsert them on the opposite sides of the computer.

Battery Monitor in the Control Strip

The estimated time remaining for each battery that is displayed in the Battery Monitor module of the Control Strip depends on the charge remaining and the battery consumption rate. The battery consumption rate depends on the software and hardware features you are using.

If the Battery Monitor module in the Control Strip indicates that no battery is installed, but you can plainly see that a battery is installed, you may need to reset the battery. Before you can reset a battery, you must either shut down the

computer or connect the power adapter. Then remove and reinsert the battery you want to reset. After a few seconds, the Battery Monitor module should recognize the battery. If the problem persists, contact your Apple-authorized service representative.

Ethernet

When connected to an active Ethernet network, your PowerBook 500 series computer will not go to sleep automatically. You can still select manual sleep, however.

Sleep, External Monitors, and the Monitors Control Panel

Your Getting Started manual may state that your PowerBook will not sleep when an external monitor is connected. This is an error. Connecting an external monitor does not affect the computer's ability to sleep.

The Monitors Control Panel allows you to set the number of colors your monitors display and to indicate the positions of your monitors. Close the Monitors Control Panel before allowing your PowerBook to sleep.

Application Programs Using Sound

If you have application programs that make extensive use of sound, Apple recommends that you turn off virtual memory while using those programs. When virtual memory is turned on, it can compromise the programs' sound quality.

Some older versions of programs, especially games, may generate sounds that seem too slow or too fast. For best results with these programs, open the Sound control panel, choose Sound Out from the pop-up menu, and set the sample rate to 22.050 kHz.

Trying the Text-to-Speech Feature

Text-to-Speech has been installed on your hard drive. This software allows text to be spoken to you by your PowerBook. Text-to-Speech is made available through application programs whose manufacturers have chosen to incorporate it. You can try this feature out by following these steps:

Step 1

Double-click the SimpleText icon to open it (or choose Open from the File menu if you are already using SimpleText).

A new document called Untitled 1 appears on the screen.

Step 2

Type a short sentence, for example, "You're a great person."

Step 3

Choose Speak All from the Sound menu.

You can also have the computer speak a portion of your document. To do this, select the text you want to hear, and choose Speak Selection from the Sound menu.

Using Adobe Type Manager

In System 7.1 and 7.5, a folder named Fonts stores all screen and printer fonts.

Fonts you drag to the System Folder are automatically installed in the Fonts folder. If you use Adobe Type Manager, but are not getting smooth type on screen, you must move any PostScript printer fonts located in the Fonts folder to the Extensions folder. Please contact Adobe to obtain a new version of ATM that will allow you to use the Fonts folder (see details below).

A version of ATM is also installed if you install QuickDraw GX. It is called ATM GX. For more information on using ATM GX, see the Macintosh System 7.5 Upgrade Guide that came with your PowerBook.

A Gift to You from Adobe

Adobe Systems offers PowerBook computer owners a free copy of Adobe Type Manager (ATM) software. With ATM, you can use thousands of PostScript Type 1 fonts on screen. In addition, ATM software can be used with PostScript typesetters and with all Macintosh- supported printers, including the ImageWriter, StyleWriter, and LaserWriter. You also receive four free typefaces from the Adobe Garamond family. These Adobe Originals are a fresh treatment of popular typefaces.

You can receive the latest release of ATM—plus the Adobe Garamond typefaces—for a \$7.50 shipping and handling charge (\$30 outside the U.S. and Canada). Together, these products normally retail for \$346.

U.S. and Canadian residents, call

1-800-521-1976 ext. 4400, or fax 1-303-792-2231

Outside the U.S. and Canada, call

(303) 799-4000 ext. 4600.

In fax requests, please include your name, shipping address, daytime phone number and credit card information. Please allow 6-8 weeks for delivery.

... This information is not in the original Read Me file.

Note: According to Adobe, the offer mentioned above expired as of December, 1995. ...

Ethernet (Built-In) 1.0.2 Information Read Me (12/95)

=====

Article Created: 20 December 1995

TOPIC -----

This article is the Ethernet (Built-In) 1.0.2 Information ReadMe.

DISCUSSION -----

Issue:

We have received many reports from customers describing problems transferring large files from the PCI-based Power Macintosh systems to a variety of AFP-based servers. The problem reports state that file transfers will stop and a -1072 error (ASP session closed) is generated. The reports also state that after the problem occurs, both AppleTalk and TCP/IP services are lost and the systems must be restarted to restore them. If Ethernet traces are taken, they show that the PCI-based Power Macintosh system disappears from the network.

Technical Description:

The cause of this problem is with the way arbitration is handled on the PCI bus in an ASIC. If there is a lot of PCI bus activity, then it is possible that the Ethernet DMA will start to transmit a packet and an underrun will occur because the DMA cannot get enough bandwidth on the PCI bus to transfer the entire packet to the Ethernet controller. If this underrun condition occurs more than 10 times, a bug in the Ethernet driver causes it to not recover the DMA buffers associated with the underrun packet. The driver only allocates 10 of these buffers and when they are gone the transmitter will no longer be able to send packets. This problem could also occur in some normal situations with a lot of disk activity.

Extent:

This bug is present in the built-in Ethernet drivers that ship with the Power Macintosh 7200, 7500, 8500, and 9500 systems. This driver is located in the "Extensions" folder in a file called "Ethernet (Built-In)". The first Power

..TIL19102-Ethernet_Built-In_1-0-2_Information_Read_Me_12-95_(TA34878).pdf

Macintosh 9500 systems shipped with version 1.0 of this file. The Power Macintosh 7200, 7500, and 8500 systems shipped with version 1.0.1 of this file. This file is for PCI-based Power Macintosh systems only.

Solution:

We have a new built-in Ethernet driver available that fixes this bug. The driver is located in version 1.0.2 of the "Ethernet (Built-In)" file. This file is also installed during the "QuickDraw 3D Accelerator Card" software installation process.

Power Macintosh 7500 & 8500: Video Player Resets Gamma (1/96)

Revised: 1/29/96
Security: Everyone

Power Macintosh 7500 & 8500: Video Player Resets Gamma (1/96)

Article Created: 20 December 1995
Article Reviewed/Updated: 29 January 1996

TOPIC -----

The Apple Video Player installed with the Power Macintosh 7500 and 8500 computers shows a TV option in the Controls window. However, when I click TV, I get a message stating "To use this feature you must have a TV tuner installed in your computer". I click OK, but I immediately notice the color and brightness change on my screen.

Why is this occurring?

DISCUSSION -----

The Apple Video Player installed on Power Macintosh 7500 and 8500 computers has an option for displaying input from a TV tuner. However, there are no hardware TV tuner options available from Apple for these computers. The Apple Video Player reports that it cannot use the TV option but it also resets the gamma settings in the Sound & Displays control panel to the default Mac Standard.

If you have set the Gamma setting to anything other than the default Mac Standard gamma in the Displays area of the Sound and Displays control panel, you will see the screen image change as the Apple Video Player resets the gamma to Mac Standard.

This issue has been investigated by Apple engineering and will be resolved in the next release of the Apple Video Player. For now, the only way to prevent Apple Video Player from resetting the gamma settings you originally changed is to avoid pressing the TV options button in the Apple Video Player Controls window.

Apple MessagePad: Word List Editing Problem (12/95)

Revised: 12/20/95
Security: Everyone

Apple MessagePad: Word List Editing Problem (12/95)

=====

Article Created: 20 December 1995

TOPIC -----

I have an Apple MessagePad 120 with the Newton 2.0 OS. When entering words in the Word List the caret does not hold the entry position for the next letters entered.

After I bring up the keyboard in any application, select the book to access the Word List, and type in a new word, I am unable to use the pen to move the caret. I must use the arrow keys. After using the arrow keys to get to a letter in the word, if I try to add a letter, it always puts it at the end of the word. What is wrong? How can I work around this?

DISCUSSION -----

This is a problem with the Word List and will be addressed in a future patch. The only way to edit a mistake in the middle of the word is to erase all the characters from the end of the word to the mistake and retype the last part of the word.

Business Ed. Bundle: Trouble With South-Western Templates 12/95

Revised: 12/20/95
Security: Everyone

Business Ed. Bundle: Trouble With South-Western Templates 12/95

=====

Article Created: 20 December 1995

TOPIC -----

I have the Apple Business Education Bundle and am having difficulty opening some of South-Western Publishing's ClarisWorks Templates. When I double-click on either the Bonus Letter or Projected vs. Actual Sales items in Lesson 13 of the QuickCourse Solutions folder, I get a message stating "Please insert the disk: ClarisWorks Template." The options are Cancel or Open.

What should I do to open these files?

DISCUSSION -----

South-Western Publishing is aware of this issue and recommends clicking Cancel. You will receive the same error message again, but the files will open when you click Cancel the second time.

AppleVision 1710AV: Frequently Asked Questions (1/97)

Revised: 1/29/97
Security: Everyone

AppleVision 1710AV: Frequently Asked Questions (1/97)

=====

Article Created: 20 December 1995
Article Reviewed/Updated: 29 January 1997

TOPIC -----

This document contains the answers to the following frequently asked questions (FAQ) about the AppleVision 1710AV Display and the AppleVision 1710 Display. The only differences between the AppleVision 1710AV and AppleVision 1710 Display are the speakers and built-in microphone included on the AppleVision 1710AV Display.

1) I have not been able to resolve a conflict between the AppleVision 1710AV Display Enabler and the Now Toolbox init. My Now Startup Manager disables the Display Enabler every time. When this is disabled I cannot get any of my 1710AV software to work. Do I need a Display Enabler update?

2) When I startup my Power Macintosh 8100/100 with 1710AV display, the Conflict Catcher and QuickTime inits load, there is a 5 second pause, then the Display enabler loads, but wipes out the first two icons (Conflict Catcher and Quicktime) and the Mac OS logo before the rest of the icons load. How can I correct this problem?

3) I have an Macintosh Quadra 840AV with a Radius VideoVision installed. I have an AppleVision 1710AV Display on order that should be arriving soon. Will the AppleVision 1710AV Display work with the Radius hardware?

4) I have a Macintosh Performa 630CD and an AppleVision 1710AV Display. When the computer starts up, it hangs pauses at the Display Enabler init and then continues starting up with just the single progress bar, without the "Welcome to Macintosh" display. I have tried everything that I have seen posted in here including resetting the PRAM, working with the extensions manager, and so on. I downloaded Applevision 1.0.2. This did not help. How can I fix this?

5) I have a question about the Display enabler and AppleVision setup. At first I the problem was with Now Utilities, but after 5 days of running a clean system install with just one non apple control panel, 'FreePPP', my system is corrupt

again. When I remove Display enabler and AppleVision Setup control panel everything works fine. Is there something wrong with the software for the AppleVision 1710AV Display?

6) I am using a Power Macintosh 7500 computer with an AppleVision 1710AV Display. A few times, after I re-calibrated the monitor, the display acquired a lavender (purple) color. At other times, after re-calibration, I can see spirals of faint diagonal lines across the entire screen. These problems invariably go away after several re-calibrations. The only non-Apple extensions I am using are Adobe Type Manager, Connectix Speed Doubler, Berkeley Systems' After Dark, and Now Utilities FileSaver. Sometimes the monitor's color is fine. Why does it do this?

7) I have an AppleVision 1710AV Display and I have discovered that while I am using the computer and the screen is blank (that is, during startup, the screen saver is on, and so on) that there are a number of barely visible colored lines running diagonally across the screen. They run the length of the screen and start from one corner all the way until the opposite. I can only see them when the screen is black. Have you heard of this? Is it a known issue? If so, what can I do to correct it?

8) We have experienced some incompatibilities with the AppleVision 1710AV Display, some third party boards, and the internal video on the Macintosh II VX. Are there any known issues with a setup like this?

DISCUSSION -----

1) Question: I have not been able to resolve a conflict between the AppleVision 1710AV Display Enabler and the Now Toolbox init. My Now Startup Manager disables the Display Enabler every time. When this is disabled I cannot get any of my 1710AV software to work. Do I need a Display Enabler update?

Answer: First, there is a known problem with Now's Startup Manager and AppleVision Software (specifically the Display Enabler). The solution is to disable Now Startup Manager and use Extension Manager. Now is aware that they have a problem and are working on a fix for it. This fix did not make into Now Utilities 5.0.2.

Second, AppleVision Software requires Display Enabler 2.0. The Display Enabler extension is needed for any 040 or nubus based Macintosh.

2) Question: When I startup my Power Macintosh 8100/100 with 1710AV display, the Conflict Catcher and QuickTime inits load, there is a 5 second pause, then the Display enabler loads, but wipes out the first two icons (Conflict Catcher and Quicktime) and the Mac OS logo before the rest of the icons load. How can I correct this problem?

Answer: AppleVision Software requires Display Enable 2.0. The Display Enabler extension is needed for any 040 or nubus based Macintosh.

3) Question: I have an Macintosh Quadra 840AV with a Radius VideoVision installed. I have an AppleVision 1710AV Display on order that should be arriving soon. Will the AppleVision 1710AV Display work with the Radius hardware?

Answer: AppleVision Monitors were only qualified on the supported built-in monitor ports (for all 68040 and PPC Macintosh computers) and on the 24AC NuBus card and the ATI PCI card. The third-party would have to revise its software driver to work with our monitor and software.

4) Question: I have a Macintosh Performa 630CD and an AppleVision 1710AV Display. When the computer starts up, it pauses at the Display Enabler init and then continues starting up with just the single progress bar, without the "Welcome to Macintosh" display. I have tried everything that I have seen posted including resetting the PRAM, working with the extensions manager, and so on. I downloaded Applevision 1.0.2. This did not help. How can I fix this?

Answer: As it states in the Read Me: "With some system software and hardware configurations, your screen may not redraw correctly during the startup process. This will not affect display performance." This is refering to problems like the one above. When the Display Enabler is loading, the screen may redraw, leaving the user with only a thermal bar left with no welcome to Macintosh window.

5) Question: I have a question about the Display enabler and the AppleVision Setup control panel. At first, I the problem was with Now Utilities, but after 5 days of running a virtually clean system software with just one non-Apple control panel, 'FreePPP', my system is corrupt again. When I remove Display enabler and AppleVision Setup control panel everything works fine. Is there something wrong with the software for the AppleVision 1710AV Display?

Answer: AppleVision Monitors require both of these software components to be loaded and they also require that the ADB cable is connected to the monitor. Otherwise the user will only get 640x480.

6) Question: I am using a Power Macintosh 7500 computer with an AppleVision 1710AV Display. A few times, after I re-calibrated the monitor, the display acquired a lavender (purple) color. At other times, after re-calibration, I can see spirals of faint diagonal lines across the entire screen. These problems invariably go away after several re-calibrations. The only non-Apple extensions I am using are Adobe Type Manager, Connectix Speed Doubler, Berkeley Systems' After Dark, and Now Utilities FileSaver. Sometimes the monitor's color is fine. Why does it do this?

Answer: This is usually caused by an error in recalibration. You only need to recalibrate a couple of times to recover from this situation. However, if the problem continues to occur there may be a hardware problem. Since the color data is transmitted over ADB, you should also avoid pressing the keyboard or bezel buttons during the recalibration.

7) Question: I have an AppleVision 1710AV Display and I have discovered that while I am using the computer and the screen is blank (that is, during startup, the screen saver is on, and so on) that there are a number of barely visible colored lines running diagonally across the screen. They run the length of the screen and start from one corner all the way until the opposite. I can only see them when the screen is black. Have you heard of this? Is it a known issue? If so, what can I do to correct it?

Answer: The diagonal lines are caused by the redraw gun inside the monitor resetting. You will see this under two circumstances.

First, brightness and contrast are turned all the way up to full. You should turn brightness down to about 50% and leave contrast all the way to full and see if the lines go away. Brightness at 50% and contrast at 100% is the suggested viewing level to get the brightest, clearest picture.

Second, the diagonal lines may appear if there is an error in recalibration. If lowering the brightness does not help, recalibrate the monitor a few times. When an error in recalibration does occur the monitor is supposed to be reset to its previous setting. Unfortunately there is no sure way of catching all of the recalibration errors. You may have to recalibrate up to 4 times before the monitor's color settings get properly restored from a miscalibration.

8) Question: We have experienced some incompatibilities with the AppleVision 1710AV Display, some third party boards, and the internal video on the Macintosh II VX. Are there any known issues with a setup like this?

Answer: AppleVision Monitors were only qualified on the supported built-in monitor ports (for all 68040 and PPC Macs) and on the 24AC NuBus card and the ATI PCI card. The third-party would have to revise its driver to work with our monitor and software.

PowerBook 190 & 5300 Series: First Drag of Icon Slow (3/96)

Revised: 3/13/96
Security: Everyone

PowerBook 190 & 5300 Series: First Drag of Icon Slow (3/96)

Article Created: 20 December 1995
Article Reviewed/Updated: 13 March 1996

TOPIC -----

Immediately after my PowerBook computer starts up, the first time I drag an item, regardless of where it is, what it is, or what I'm doing with it (copying, moving, and so on), I get a clock on the screen and the computer waits about 15-30 seconds before it responds.

After the first drag, I do not get the delay again until I restart and try dragging something again. What is causing this and is there anything I can do to correct this issue?

DISCUSSION -----

Issue -----

This is caused by the Macintosh Easy Open (MEO) control panel. This occurs on PowerBook 5300 and 190 series computers running their original system software version 7.5.2.

Workaround -----

Disabling MEO in the Extension Manager control panel and restarting the computer prevents this issue from occurring.

Resolution -----

Installing either the PowerBook 5300 Software Update or the System 7.5 Update 2.0 will correct this issue making the workaround unnecessary.

Article Change History:
13 Mar 1996 - Added resolution information.

AppleCD 600: Issues With CD Plus (CD+) Discs (8/96)

Revised: 9/27/96
Security: Everyone

AppleCD 600: Issues With CD Plus (CD+) Discs (8/96)

Article Created: 21 December 1995
Article Reviewed/Updated: 27 September 1996

TOPIC -----

When I play a CD Plus (CD+) format CD-ROM disc, I get a stuttering, or skipping sound from the computer, and sometimes the CD-ROM disc will not mount.

DISCUSSION -----

There are several things that you must consider regarding this issue.

CD-ROM Drives
=====

There is a known problem with early versions of quad-speed (4X) drives used by Apple that did not allow the drive to read multisession data CD-ROM discs. If you continue to have problems reading multisession CD-ROM discs after checking the issues below, see an authorized Apple service provider for further troubleshooting.

CD-ROM Setup Software
=====

The next is CD-ROM Setup software. You should install the latest version of CD-ROM Setup (this should be version 5.1.2 or greater), for complete compatibility with multisession data CD-ROM discs.

Titles Created with Apple Media Tool
=====

The third is CD-ROM Discs created with Apple Media Tool version 1.2 and below. Many of these titles have a problem known as the AMK Spinning Cursor Bug. This is fixed with the software of the same name posted in Apple SW Updates area of online services.

CD Plus Standards

=====

The next thing to know is that there is not yet a "CD Plus" or "Enhanced CD" standard. The final specification is to be completed by the end of 1995 by Apple, Microsoft, Sony, and Philips, so no CD-ROM discs currently on the market conform completely with the Blue Book standard, which is in its final revision. Even the name "CD Plus" will not be used, because of trademark conflicts.

Interactive Music Formats

=====

The last thing to know is that there are several formats of interactive music discs on the market.

- Yellow Book CD-ROM only.
- Yellow Book CD-ROM Hybrid with Red Book audio tracks that may damage audio players, or users ears.
- Hybrid discs with CD-ROM and Red Book audio tracks, known as a track 0 solution.
- Hybrid discs with Macintosh and Windows partitions - ISO-9660 compatible.
- Multisession CD-ROMs with separate CD-ROM and Red Book audio volumes.
- Blue Book standard discs by whatever name it is called. These CD-ROM discs will be stamped multisession discs with Red Book audio tracks.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

AppleVision 1710AV: Requires Multiple Sound Settings (12/95)

Revised: 12/21/95
Security: Everyone

AppleVision 1710AV: Requires Multiple Sound Settings (12/95)

=====

Article Created: 21 December 1995

TOPIC -----

I cannot hear any sounds from my Macintosh computer connected to my AppleVision 1710AV Display. If I use a tape player, instead of the computer as the sound source, I can hear the tape through the display. If I disconnect the external speaker connection, I can hear my computer through the internal speaker on the computer. How can I get the AppleVision 1710AV Display to play the computer sounds?

DISCUSSION -----

In the Sound & Display control panel, you must have both the AppleVision speakers AND external headphones checked in order to hear sound from the AppleVision 1710AV Display. If you only have one of these options checked, audio is not sent to the display.

Article Created: 21 December 1995

TOPIC -----

This article contains the Video Out Default (PAL) extension ReadMe file. This extension is preinstalled on Power Macintosh 8500 computers purchased in countries that use the PAL standard.

DISCUSSION -----

Video Out Default (PAL)

This extension is intended for use on the Power Macintosh 8500 Series in countries that use the PAL television standard.

You do not interact directly with this extension. It works behind the scenes as part of your system software.

For countries that use the PAL television standard, this extension is preinstalled. However, should you wish to install it into a new System Folder, follow these instructions:

To Install Video Out Default (PAL):

Step 1

Drag the Video Out Default (PAL) icon from the CD to your hard disk's System Folder icon (do not open the System Folder).

Step 2

Click OK in the dialog box that appears.

Step 3

Restart your computer.

Why is this extension needed?

The Power Macintosh 8500 can detect whether or not a television is plugged in, but is not able to determine if the television uses the PAL or NTSC television standard. The system software normally assumes that an NTSC television is connected.

This extension alerts the system software that it should assume a PAL television is connected instead.

Apple Internet Dialer 1.0 Incompatible w/ Virtual Memory (9/96)

Revised: 9/4/96
Security: Everyone

Apple Internet Dialer 1.0 Incompatible w/ Virtual Memory (9/96)

=====

Article Created: 21 December 1995
Article Reviewed/Updated: 4 September 1996

TOPIC -----

Is the Apple Internet Dialer, which is part of the Apple Internet Connection Kit (AICK) 1.0, incompatible with virtual memory (VM)?

DISCUSSION -----

With AICK 1.1 and later, the Apple Internet Dialer is compatible with VM.

The Apple Internet Dialer, in AICK 1.0, is incompatible with virtual memory (VM). VM must be turned off for the dialer to make a functional PPP connection.

This article was published in the "Information Alley":
Volume II, Issue 18, Page 12

Article Change History:
04 Sep 1996 - Change title to better reflect article.
12 Aug 1996 - Updated for AICK 1.1 Internet Dialer.

Color LW 12/600 PS: Life of Consumables & Printer (3/97)

Revised: 3/20/97
Security: Everyone

Color LW 12/600 PS: Life of Consumables & Printer (3/97)

Article Created: 21 December 1995
Article Reviewed/Updated: 20 March 1997

TOPIC -----

What factors affect the life of the Color LaserWriter 12/600 PS and its consumables? How do I determine when to replace the consumable items?

DISCUSSION -----

The Color LaserWriter 12/600 PS DC controller maintains several non-volatile parameters which are used to signal various alert conditions to the user. The list of stored parameters includes the following:

Begin_Table

Parameter Description	Range of values
Print delivery counter	0 -100,000 (prints)
Number of delivered prints following cleaning belt out warning	0 - 500 (prints)
Photoconductor life check-use counter	0 - 18,000 (counts)
Number of delivered prints following oil out warning	0 - 50 (prints)

End_Table

In addition to the parameters listed above, the I/O controller maintains a separate page counter which generates the page count value listed on the startup page. The printer does not maintain any special counters for tracking the life expectancy of the complete print engine. The Color LaserWriter 12/600 PS user's

manual states that the minimum life expectancy is 5 years or 300,000 pages in black and white mode, and 150,000 pages in the full color mode. Many customers will get acceptable results well beyond these numbers as long as the printer is properly used and maintained according to the guidelines in the user's manual.

Fuser Assembly Life =====

Apple recommends that the fuser be replaced after 60,000 pages by the customer using the instructions located in the user's manual. The fuser is included as part of a special maintenance kit available from finished goods that includes a fuser, transfer drum cleaning assembly, separation discharge unit, ozone filter, and air filter. The finished goods part numbers for the maintenance kit are M3867G/A for 110V printers, and M4234G/A for 220V printers.

The fuser life does not vary depending on the type of printing (black and white, color) because each printed page is only fused once. The fuser and alert LED's on the printer status panel turn on after a sensing arm in the fuser cleaning web assembly drops through a notch cut into the cleaning web fabric and triggers a photosensor. Once the LED's turn on the printer will allow 500 pages to be printed before shutting down. Apple recommends that the fuser be replaced after 60,000 pages, however there is enough cleaning web fabric to allow the fuser to print as many as 100,000 pages before the LED's turn on. Testing has shown that after approximately 60,000 pages the print quality may begin to deteriorate due to toner and paper dust accumulation indicating the need for the maintenance kit.

Fuser Oil Life =====

The fuser oil used in the Color LaserWriter 12/600 PS is replenished from a user replaceable oil bottle. Each bottle contains enough oil for approximately 10,000 pages. The oil reservoir which is part of the fuser assembly contains a small plastic ball that floats on the surface of the oil. When the oil level drops to a predetermined level a photosensor is triggered a photosensor the oil low and alert LED's turn on. Once the LED's turn on the printer will allow 50 pages to be printed before shutting down.

Photoconductor Life =====

The photoconductor life counter maintained on the DC controller is used to determine when the photoconductor and alert LED's should be turned on. As soon as the counter reaches 3000 prints as specified in the DC controller microcode, the LED's turn on. The counter increments only when printing full color documents, not black & white pages.

The life of the photoconductor varies depending on the type of printing being done because the photoconductor makes four passes when in the full color mode, and only one pass when in the black and white mode. The life of the photoconductor also varies depending on whether the printing is continuous or

intermittent. During continuous printing the density calibration only has to be done once every 100 pages, however when the printer is operated intermittently the printer may have to perform the density calibration each time the printer is awakened from the sleep mode. Other mechanical areas of the printer such as the fuser assembly are not activated during the calibration process and therefore their life expectancy does not change significantly depending on the type of printing being done.

Apple recommends that the photoconductor be replaced only after the customer determines that the print quality is no longer acceptable. For some customers this may be as early as 4,000 pages, but for other customers it may be significantly longer. Customers should keep the startup and demo pages in a binder after a new photoconductor is installed. This allows customers to judge their print quality by printing and comparing future startup and demo pages with those in the binder. It's also helpful to put the date at the top when the pages are printed.

Toner Cartridge Life

=====

The life of each toner cartridge will vary significantly depending on the type of printing being done. Documents which contain large areas of color will use more toner than a black and white text document. On average each toner cartridge should last approximately 4,000 pages when printing documents with average page coverage of 5%.

The printer uses a sweeping blade and two clear windows integrated into each toner cartridge to determine the amount of toner left in each cartridge. A photosensor located on the print engine measures the amount of time that the toner blocks each window as the sweeping blade passes by. When the toner reaches a preset level the alert and corresponding toner LEDs turn on. A toner low alert condition will not shut down the printer, however the print quality may be affected.

LaserWriter Select 360: Setting DTR to ON (12/95)

Revised: 12/21/95
Security: Everyone

LaserWriter Select 360: Setting DTR to ON (12/95)

=====

Article Created: 21 December 1995

TOPIC -----

I am trying to download a PCL typeface to the LaserWriter Select 360 printer, and in the printouts I am getting square blocks printed in place of the characters. If the printer is set to DTR, I am able to download the fonts correctly to the printer. If it's set to XON/XOFF, I cannot download the fonts. Is there a way of setting the serial port on the printer to DTR permanently?

DISCUSSION -----

The easiest way to solve this problem is by using Apple Printer Utility 2.0 to change the serial communication ports on the LaserWriter Select 360 (under the "Communication Configuration" section). You can set the flow control to DTR there.

IMPORTANT:

The thumbwheel switch on the back of the printer must be in position #8 in order for the following serial port parameters to take effect.

PostScript Code to Change to DTR

=====

If you don't have a Macintosh, then you can download the following PostScript to the printer (remember that PostScript IS CASE SENSITIVE). Again, you must have the thumbwheel switch in position #8 in order for the serial port parameters to take effect.

CAUTION:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

%=====

% Begin PostScript code

```
%  
(%Serial_NV)  
<< /FlowControl /Dtr  
>> setdevparams  
%  
% End PostScript code  
%=====
```

Other values for the port can be set by including the various key-value pairs outlined below within << >> setdevparams, for example:

```
%=====
```

```
% Begin PostScript code  
%  
(%Serial_NV)  
<<  
/Baud 9600  
/FlowControl /XonXoff  
/Interpreter /LaserJetIII  
>> setdevparams  
%  
% End PostScript code  
%=====
```

Key-value pairs for the LaserWriter Select 360 serial port

/Baud 9600

Default: 19200

Possible values: 300, 600, 1200, 1800, 2400, 3600, 4800, 9600, 19200, 38400, 57600.

Use: Designates the baud rate on the serial hardware.

/CheckParity true

Default: false

Possible values: true or false

Use: Designates whether or not the device will perform a parity check on incoming data. If the parameter is true, parity checking occurs. If it is false, there is no parity checking.

/DataBits 8

Default: 8

Possible values: 7 or 8

Use: Designates the number of data bits per byte transferred over the channel. If it is set to 7, the high bit of the byte is set to 0.

/Enabled false

Default: true

Possible values: true or false

Use: Indicates whether data arriving at the printer should be scheduled for execution. If it is true, data is executed. If it is false, data is not executed.

/FlowControl /Dtr

Default: /XonXoff

Possible values: /XonXoff and /Dtr

Use: Indicates the serial flow control method used between the host computer and the printer.

/HasNames /false

Default: /false

Possible values: true or false

Use: Indicates whether the printer supports named files. If the printer is not mounted, or if Type is /Communications, this value is false. This value is a read-only constant.

/Interpreter /LaserjetIII

Default: /PostScript

Possible values: /PostScript, /AutoSelect, or /LaserJetIII

Use: Indicates the type of executable job represented by the arriving data.

/On false

Default: true

Possible values: true or false

Use: Indicates whether or not the printer driver for the communications device is turned on and is able to receive and send data. If this value is false, data sent to the printer is lost.

/Parity /None

Default: /None

Possible values: /None, /Space, /Odd, /Even

Use: Indicates the type of parity to be used between the host computer and the printer.

/Protocol /Normal

Default: /Normal

Possible values: /Raw or /TBCP

Use: Indicates the type of communications protocol to be used.

- /Raw: Lets all data pass through unfiltered. Control characters such as End-of-file (CTRL-D) and status queries (CTRL-T) are passed through and not acted upon.
- /TBCP: tagged binary communication protocol.

/StopBits 1

Default: 1

Possible values: 1 or 2

Use: Indicates the number of stop bits to be transmitted by the serial hardware. Alternative settings are 1 and 2.

AppleShare Workstation v 3.6.1 User's Guide (12/95)

Revised: 12/21/95
Security: Everyone

AppleShare Workstation v 3.6.1 User's Guide (12/95)

Article Created: 21 December 1995

TOPIC -----

This article is the AppleShare Workstation User's Guide.

DISCUSSION -----

Contents

=====

How to Use This Guide
System Requirements
Updating System Software
Installing Network Software
Installing AppleShare Workstation 3.6.1
Workstation Quick Reference

How to Use This Guide

=====

This guide describes how to upgrade your system software, networking software, and AppleShare Workstation software and also provides instructions on how to use your AppleShare Workstation software. Print a copy of this guide to have available for easy reference.

System Requirements

=====

To get the best performance from your AppleShare network, you'll need the following:

- System 7.5.1
- Network Software 1.5.1
- AppleShare Workstation 3.6.1

NOTE: If you have a PCI -- based Power Macintosh, System 7.5.2 and Open Transport are installed on your computer. All you need to do is install the workstation software; skip to the section "Installing AppleShare Workstation 3.6.1."

Updating System Software

=====

If you have System 7.5 (choose About This Macintosh from the Apple () menu to determine the version of system software your computer is running), you can update to System 7.5.1. The System 7.5 Update Installer is located on the AppleShare 4.2 CD-ROM disc; contact your AppleShare administrator for more information.

Installing Network Software

=====

To upgrade your Network Software to version 1.5.1:

- 1) Connect and log on to your server computer.
- 2) Open the Workstation Software 3.6.1 folder on your server.
- 3) Open the Network Software Installer folder.
- 4) Double-click the Installer icon; the Installer window appears.
- 5) Click Continue; a dialog box similar to the following one appears.
- 6) Verify that the correct destination disk is named in the Installer.
(If the wrong disk name is shown, click Switch Disk until the name of the correct destination disk appears.)
- 7) Click Install.
- 8) When you see a dialog box telling you that installation is complete, restart your computer.

Installing AppleShare Workstation 3.6.1

=====

You are now ready to complete the installation process by installing the latest workstation software.

- 1) Connect and log on to your server computer.
- 2) Open the Workstation Software 3.6.1 folder on your server.
- 3) Open the AppleShare Workstation folder.
- 4) Double-click the Installer icon; the Installer opens.
- 5) Verify that the correct destination disk is named in the Installer.
(If the wrong disk name is shown, click Switch Disk until the name of the correct destination disk appears.)
- 6) Click Install.
- 7) When you see a dialog box telling you that installation is complete, restart your computer.

Workstation Quick Reference

=====

This quick reference provides at-a-glance directions for the most common AppleShare operations.

Connecting to a file server

- 1) Choose the Chooser desk accessory from the Apple menu.
- 2) Make sure that AppleTalk is active (the Active radio button should be selected).
- 3) Select the AppleShare icon in the upper-left corner of the window.
If your network contains zones, they are listed in the lower-left corner of the window. When you select a zone, AppleShare file servers in that zone are listed in the upper-right portion of the window.
- 4) Select the name of the file server you want to use and click OK.
- 5) In the dialog box that appears, click Guest or Registered User, enter your name and password (if necessary), and then click OK.
- 6) Select the name of the volume you want. If you click the checkbox next to the name of a volume, you can connect to the volume automatically the next time (and anytime) you start up your computer.
- 7) Click OK and close the Chooser.

Disconnecting from a file server

To disconnect from a file server, drag the icon of the server volume to the Trash. Note that you are disconnected automatically from the server when you shut down your computer.

Selecting a print server

- 1) Choose the Chooser desk accessory from the Apple menu.
- 2) Make sure that AppleTalk is active (the Active radio button should be selected).
- 3) Select the LaserWriter or AppleTalk ImageWriter icon in the upper-left corner of the window.
If your network contains zones, they are listed in the lower-left corner of the window. When you select a zone, available printers in that zone are listed in the upper-right portion of the window.
- 4) Select the name of a print spooler you want to use and close the Chooser.

Usually, a spooler's name will be made up of the name of the printer it manages plus the word "Spooler." The print spooler you select will remain in effect until you change it.

About access privileges

Access privileges govern what you and other users of a file server can see or alter. The following lists the access privileges (See Folders, See Files, or Make Changes) that you must have in order to perform the listed actions:

Copy a file to a folder - Make Changes

Copy a file from a folder - See Folders, See Files
Copy a folder to a folder - See Folders, Make Changes
Copy a folder from a folder - See Folders
Create a file - See Folders, See Files, Make Changes
Create a folder - See Folders, Make Changes
Delete a file - See Files, Make Changes
Delete a folder - See Folders, Make Changes
Move a folder to a folder - See Folders, Make Changes
Move a folder from a folder - See Folders, Make Changes
Open and use a file - See Files
Save changes to a file - See Files, Make Changes

Finding out what privileges you have

There are three ways to find out your access privileges:

- Look at the folder icons; icons appear different according to your privileges for each folder.

Tabbed folder - You are the owner of the folder
Plain folder - You have some access privileges to the folder
Locked folder - You do not have any access privileges to the folder
Locked folder with arrow - You have Make Changes privilege to the folder

- View the access privilege icons in the top-left corner of the directory window of a folder. They can tell you what privileges you do not have.

A crossed out file icon means you can't see files.
A crossed out folder icon means you can't see folders.
A crossed out pencil means you can't make changes.

- Select the folder and choose Sharing from the File menu of the Finder. A window appears, showing you who owns the folder and what privileges you have for the folder.

Setting access privileges

-
- 1) Select a folder that you own on the file server and choose Sharing from the File menu.
 - 2) In the window that appears, click the checkboxes of the privileges you want to assign.
When a checkbox has an "X" in it, that privilege is selected.
To copy the privileges you selected to all folders within the folder, click the "Make all currently enclosed folders like this one" checkbox.
 - 3) Close the window and, in the alert box that appears, click Save.

Photoflash: Opens and Quits Immediately (1/96)

Revised: 1/5/96
Security: Everyone

Photoflash: Opens and Quits Immediately (1/96)

Article Created: 22 December 1995
Article Change History: 5 January 1996

TOPIC -----

I use the PhotoFlash software on my Macintosh computer. Lately, when I double-click the application to open it, it begins to open and then immediately quits with no error message. I have tried the following but get the same failure:

- Reinstalled the PhotoFlash application
- Tried to launch it after booting with extensions off
- Made sure there is enough free memory available in the Finder before launching the application
- Adjusted the application's memory preference in the Get Info window
- Reset the PRAM

DISCUSSION -----

You may have a corrupted PhotoFlash preference file. Locate the PhotoFlash preference file in the Preferences folder of your System Folder. Drag the file to the Trash and choose Empty Trash from the Special menu.

The next time you launch PhotoFlash, it will create a new default preference file. Any changes you had made to your Preferences will have to be reset under the Edit menu.

If PhotoFlash still fails to launch, see TIL article "Macintosh: System Crashes and Basic Troubleshooting" for more help with troubleshooting extension conflicts and system software corruption.

Newton 2.0 OS: Error -48402 in Calls Application (1/96)

Revised: 1/5/96
Security: Everyone

Newton 2.0 OS: Error -48402 in Calls Application (1/96)

=====

Article Created: 22 December 1995
Article Reviewed/Updated: 5 January 1996

TOPIC -----

In the Calls application I wrote in my contact's name and when it was interpreted I selected the contact in the pick list. The contact's phone number was not automatically entered so I wrote it in and then tapped Place Call. An error message which read "Sorry, a problem has occurred. (-48402)" appeared. Now I cannot access that call, and after getting out of the Calls application I get the same error when I try to open it again.

DISCUSSION -----

If the phone number is not automatically entered into the Phone field, and you manually enter a phone number, you get the -48402 error. To prevent this error, make sure a number is entered in the name card*. If you tap Place Call and a number is already entered, such as a Work number, that number is used when you tap Place Call. If there is not a number entered, you have the opportunity to enter a number if it is not already on the call slip.

* Note: For an individual, you need a home number, not just a work number.

Getting Back Into Calls Application
=====

To get back into the Calls application, tap the Find button and find the name you used in the Calls application. A list of found items including the name card and the call appears on the Apple MessagePad. Tap the box next to the call, choose Delete from the Routing Slip.

Alternate Method

There is another method of removing the call information, however this method erases ALL Calls data, so do not use this method if you want to retain some of

your Calls data.

To get rid of the corruption you can also change to Storage view in the Extras drawer (tap on the pick list at the top of the Extras Drawer and choose Storage); tap the Calls icon to display soup information, and delete the soup.

PowerBook 5300 & 190: Turns Off When In Target Disk Mode (1/96)

Revised: 1/2/96
Security: Everyone

PowerBook 5300 & 190: Turns Off When In Target Disk Mode (1/96)

=====

Article Created: 2 January 1996

TOPIC -----

When trying to use my PowerBook computer in Target (SCSI) Disk Mode I follow this procedure: connect the SCSI cables, turn on the PowerBook computer, wait for the lit grey screen on the PowerBook, and then turn on my desktop computer. As soon as the desktop computer powers on, the PowerBook computer immediately powers off. Why?

DISCUSSION -----

It is possible that the situation you are experiencing is a result of not deactivating the PowerBook Password Security software. When activating the PowerBook Password Security, a message appears which says, "Important: You must turn off password protection before using this PowerBook in SCSI disk mode."

The reason you need to turn off the PowerBook Password Security is that if the PowerBook is accessed by an unsupported computer (as in Target/SCSI Disk mode) the PowerBook computer will turn itself off for protection.

To correct the situation, you must follow these steps:

Step 1

Shut down both the PowerBook and Desktop computers and any other devices in the SCSI chain

Step 2

Disconnect the PowerBook SCSI cable from the back of the PowerBook.

Step 3

Power on the PowerBook computer.

Step 4

Open the Password Security control panel and set the Password Security to off instead of on.

Step 5

Shut down the PowerBook computer and reconnect the SCSI cable(s).

Step 6

Start up the PowerBook computer.

Step 7

Power on all other SCSI devices (if present). Then start up the desktop computer.

Open Transport 1.1: General Information Q & A (3/96)

Revised: 3/8/96
Security: Everyone

Open Transport 1.1: General Information Q & A (3/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on general information for Open Transport 1.1.

DISCUSSION -----

Question: What is Apple Open Transport?

Answer: Apple Open Transport is the modern networking and communications subsystem for the Mac OS. Open Transport is based on industry standards and brings a new level of networking connectivity, control, and interoperability to Mac OS systems, while preserving and enhancing the hallmark of the Macintosh and Mac OS - built-in support for easy-to-use networking.

Question: What long-range Apple goals are advanced through Open Transport?

Answer: Apple believes that communications and collaboration technologies are integral and fundamental to personal and workgroup computing. With Open Transport our goal is to provide the foundation to make Mac OS the best desktop OS for multiprotocol networking, anywhere.

Question: What needs must be addressed to be "the best"?

Answer: Networking and communications technologies are mission critical - thus reliability is a base-level requirement. Organizations require interoperability in heterogeneous environments; full compliance with standards is necessary.

High performance is also key. Increasing file sizes - often related to the rich media types found in graphics and publishing, multimedia, video production, and technical markets - create a demand for effective use of higher bandwidth

communications technologies such as ISDN, FDDI, fast Ethernet and ATM.

Beyond these base-level requirements, network managers, end-users and developers each have additional needs.

- Network managers need networked systems to support a flexible model of administration that accommodates both centralized and decentralized management models.
- Users are typically more interested in communications as a basis for productivity applications. As such, they want networking that is easy to set up and easy to use. This becomes even more important when users are mobile, needing access to networking services from wherever they may be - without requiring complex reconfiguration for each connection type and location.
- Developers need to address the broadest possible markets with minimum incremental investment. In short, they need standards based, cross-platform APIs and development tools.

Question: What were some of the key goals driving the development of Open Transport?

Answer: Apple began with two key assumptions: that networking is inherently a multiplatform, multiprotocol proposition; and that customers should not have to start over to achieve networking interoperability. This led us to adopt five key design goals:

- Open Transport must protect customer and developer investments in existing network infrastructure and applications.
- Open Transport must be based on existing cross-platform industry standards.
- Open Transport must provide users with an easy to set-up, easy to use abstraction of the underlying complexity of multiprotocol networking.
- Open Transport must also provide a complementary abstraction of networking and communications services for applications developers.
- Open Transport must offer a flexible run time model - one that lets a specific protocol be configured and selected at run time, rather than linked at compile time.

Open Transport 1.1: Key Features and Benefits Q & A (3/96)

Revised: 3/8/96
Security: Everyone

Open Transport 1.1: Key Features and Benefits Q & A (3/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on key features and benefits for Open Transport 1.1.

DISCUSSION -----

Question: How can Open Transport benefit users?

Answer: Open Transport provides individual computer users with many benefits. Two of the most immediately visible and important benefits relate to making networking more accessible - that is, easier to configure and easier to use.

For example, Open Transport makes it easy to switch from one network configuration to another. A computer user "on the go" might want to hook up to the Internet in various locations, each requiring a different network configuration. With Open Transport settings for each network location can be stored for easy access and use. Changed settings are available immediately - no reboot of the computer is required to use the new configuration.

Open Transport also integrates on-line help, based on Apple Guide technology, to make it easier for an individual to hook up to an network, with fewer demands on network manager and support resources.

Question: How can Open Transport benefit network managers and organizations?

Answer: Open Transport provides significant new flexibility in setting up network configurations; with Open Transport, the network manager can recommend or require configuration settings for users on the network, or allow users to determine their own settings.

Open Transport also improves support for centralized configuration management.

For example, Open Transport/TCP supports the Dynamic Host Configuration Protocol (DHCP), allowing network managers to administer addressing and other TCP/IP configuration information from a central server.

Question: How can Open Transport benefit developers?

Answer: Open Transport is designed to make it easier and more cost-effective to develop Mac OS-applications for a wide variety of customers and markets. With Open Transport, Mac OS has built-in networking and communications based on cross-platform industry standards including the POSIX compliant X/Open Transport Interface (XTI), UNIX STREAMs and Data Link Provider Interface (DLPI).

Applications written to support Open Transport can directly support a wide range of networking environments (serial, dial-up network, LAN, and WAN), and multiple protocols (AppleTalk, TCP/IP, serial, and others) from a common code base. This capability is sometimes referred to as transport independence.

Question: What is transport independence? Why is it important?

Answer: Different people judge networking in different ways. End-users focus on what they can do using the network, and tend to select applications based on functionality and ease of use. Network managers are interested in delivering reliable network services in a cost efficient manner. Developers want to create compelling functionality for users, but are strongly influenced by the availability of networking infrastructure.

Unfortunately, with current networking tools and systems developers are forced to tie their applications to specific network infrastructure requirements - driven by their API choices. This creates a potential conflict between individual and organizational needs. If network managers restrict protocols to control support costs, users may not have access to the applications they need. If user require specific applications they may increase support costs for the network manager by "dragging along" specific network infrastructure requirements. Developer are stuck in the middle, making decisions for both users and network managers by selection of an API at compile time.

Transport independence is a concept that breaks this undesirable linkage. When implemented, it allows developers to write to a uniform set of APIs, users to focus on selecting the best applications, and network managers to make independent decisions about network infrastructure, all on an ongoing basis.

Question: What benefits can be realized from transport independent applications?

Answer: For end-users, transport independence brings an increased freedom to select applications that meet their needs, without being concerned with the bits and bytes of networking protocols. For network managers, transport independence allows increased flexibility in designing and controlling infrastructure demands arising from support of end-user applications, that is, the freedom to manage the bits and bytes of networking protocols.

Developers who create transport independent applications will find access to broader markets with incremental resources; code written for the AppleTalk market, for example, can be delivered to TCP/IP markets as well.

Question: How does Open Transport enable transport independence?

Answer: Open Transport brings together four technologies to support the development and deployment of transport independent applications on Mac OS:

- a set of look-and-feel guidelines that promote consistency for configuration of network services across protocols,
- a unified set of cross-platform, standards based APIs for all networking and communications protocols; for example, applications can send and receive data over an AppleTalk LAN or the TCP/IP based Internet using the same programming interfaces,
- a dynamic link-and-load architecture and set of protocols; protocols are loaded and unloaded on demand, conserving system resources, and making it possible to substitute TCP for ADSP at application launch time (for example),
- an addressing and naming support tool box; for example, applications can open a communications end-point by name (that is, "seeding.apple.com" or "printer16:LaserWriter@sales"; Open Transport will automatically provide the appropriate name-to-address mapping services (that is, DNR, NBP, and so on).

Together these support the creation of transport independent applications on Mac OS.

Question: Are all Open Transport applications transport independent?

Answer: No. While Open Transport provides the necessary foundation, there are certain guidelines and programming practices required for developers to create transport independent applications. For example, most protocols have many features in common - but also some features that are protocol-specific. If an application depends on a protocol-specific feature, then it will depend upon that protocol as well.

In some cases it may be appropriate or desirable to develop a transport-specific application. For example, an Mbone client is currently only useful when communicating using TCP/IP.

Question: Does transport independence imply that an organization can offer "AppleTalk services" without supporting AppleTalk protocols?

Answer: For each service and network environment, protocol and services choices will be determined by a combination of factors; transport independence is only one of them.

This begins with both the client and the server implementations of the particular service of interest (file, print, e-mail, directory, security, back-up, calendar, and so on) supporting the Open Transport APIs. Next, both the client and server must have the protocol stack(s) of choice installed. Finally, the server application must include some administration utility to allow the network manager to specify the protocol(s) over which application and/or presentation layer services are to be provided.

The user experience for selecting the server (that is, "Choosing", or "name-binding") may vary depending on the underlying protocol. For example, AppleTalk offers a distinctive user experience through the "Chooser" and the underlying NBP/ZIP protocols. TCP/IP offers a substantially different model for name-to-address translation (DNS); NetWare/IPX still another (NDS).

Question: In addition to providing for transport independence, how is the Open Transport standards based architecture important?

Answer: Although it might seem that the use and support of standards based APIs is of direct interest only to developers writing applications code, Apple's adoption of a fully standards based architecture for networking also has important benefits for individual users, network managers, and organizations. Some of these include:

- Porting of network protocols, drivers, and applications from other platforms (especially UNIX) to Mac OS becomes easier, resulting in an even wider selection of networking software for the Mac OS,
- A larger developer community is focused on STREAMs than would be focused solely on the Mac OS, making it possible to leverage development efforts underway outside Apple - for example, Apple's demonstration of IPv6 (next generation TCP/IP) on the Macintosh platform in cooperation with Mentat Inc.,
- Developers experienced in writing high-performance, high-reliability networking hardware and software for UNIX systems can apply their expertise directly to the Mac OS, accelerating the availability of similar solutions for Mac OS customers.

Open Transport 1.1: Component Technologies Q & A (3/96)

=====

Article Created: 2 January 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on component technologies for Open Transport 1.1.

DISCUSSION -----

Question: What technology components comprise Open Transport?

Answer: Open Transport supports LANs and WANs and will integrate serial communications, modems, and remote (dial-up) networking in a consistent model for end-users, network managers, and developers. The Open Transport architecture consists of:

- standards based programming interfaces for applications developers and for network interface controller developers,
- a new cross-platform development model for integration of networking with the underlying operating system,
- a set of dynamic link-and-load memory management services,
- new implementations of Mac OS protocol stacks,
- new human interface applications and control panels, and
- a set of backward-compatibility support modules.

Question: What current Mac OS technologies and components will Open Transport replace?

Answer: When installed, Open Transport replaces the current Mac OS

implementations of AppleTalk and TCP/IP (including the protocols and the "Network", "MacTCP", and "Admin TCP" control panels).

Over time, Open Transport is also designed to replace the Connection Manager and the Communications Resource Manager of the current Communications Toolbox architecture.

Question: Does that mean that Apple is migrating serial communications away from the Communications Toolbox (CTB)?

Answer: Partially, but not entirely. The CTB File Transfer and Terminal Managers continue to be supported and will be preserved in the Copland OS release - although on new Open Transport/Serial underpinnings.

Over time, plans call for the CTB Connection Manager and its tools to be phased out in favor of Open Transport. In particular, while the Copland release of Mac OS is expected to provide support for the Connection Manager APIs, at this time Apple has no plans to port the existing Connection Manager tools to Copland. Thus, Apple recommends that developers plan their update to Open Transport/Serial (and away from CTB Connection Manager) to coincide with (or precede) the availability of the Copland OS release.

Question: What standards are implemented in the Open Transport architecture?

Answer: Open Transport brings standards based networking into Mac OS with support for:

- the X/Open Transport Interface (XTI), the POSIX compliant API for support of networking applications,
- the Datalink Provider Interface (DLPI), for development of network interface controller (NIC) drivers,
- a port of a UNIX System V release 4.2 compatible STREAMs environment for network protocol developers.

Question: Did Apple develop the STREAMs environment for Open Transport?

Answer: To maximize the stability, performance, and robustness of Open Transport, Apple selected Mentat Inc. - the leading supplier of high performance kernel-level network software - to supply the STREAMs environment for Open Transport.

Mentat Portable STREAMs (MPS) is an independent fast, full-featured, multiprocessor safe version of the UNIX System V Release 4 STREAMs environment. Its incorporation into Open Transport provides a reliable platform for protocol development, including Apple's own implementation of a STREAMs based AppleTalk stack. MPS also allows easy porting from other platforms of third party protocols. MPS is the same implementation of STREAMs found inside many industry standard UNIX operating systems, including those from IBM and OSF, as well as

other platforms such as Novell NetWare.

Question: Did Mentat supply other technology to Apple in connection with Open Transport?

Answer: Yes. Mentat supplied the source code base for Open Transport/TCP, and has worked closely with Apple on the development of an archetypal high-performance DLPI driver.

Mentat TCP (MTCP) is a robust implementation of TCP/IP that conforms with all industry standards, and is the basis of another leading workstation TCP stack. It makes a significant contribution to the performance and functionality of Open Transport/TCP.

Question: Is there more information available about Mentat Inc. and its products?

Answer: Mentat maintains a presence on the world wide web at:
<http://www.mentat.com>

Question: What dynamic link-and-load technology is used by Open Transport?

Answer: On 680x0 Mac OS systems, Open Transport uses the Apple Shared Library Manager (ASLM) 2.0. On PowerPC Mac OS systems, Open Transport is based on a combination of ASLM (for 680x0 applications) and the newer Code Fragment Manager, CFM (for PowerPC applications).

Question: Which protocols are supported by Open Transport?

Answer: Open Transport version 1.1 includes implementations of AppleTalk, and TCP/IP, and consistent API access to serial communications.

Apple and third parties are working to add support to Open Transport for Point to Point Protocol (PPP), NetWare (NCP/IPX), Windows 95 (SMB/TCP/NetBIOS), DECnet, LAT, and X.25. Some of these additional capabilities may be incorporated or bundled with future releases of Apple Open Transport.

Question: Are there any changes in AppleTalk or TCP/IP with Open Transport?

Answer: Yes. The new Open Transport/AppleTalk and Open Transport/TCP protocol stacks both have been implemented as Open Transport STREAMs modules and as native code on PowerPC Mac OS computers. They support the new XTI APIs, and their shared libraries can be dynamically loaded and unloaded as needed.

Both protocols also support dynamic reconfiguration (changed settings without requiring reboot), and feature new configuration applications offering Basic, Advanced, and Administrator tools. The new configuration applications - AppleTalk and TCP/IP - replace the older control panel implementations -

Network, MacTCP, and AdminTCP. For backward compatibility the new applications continue to be stored in the Control Panels folder.

Each protocol stack also offers addition protocol-specific feature enhancements.

Question: When should users update their systems to Open Transport?

Answer: With the availability of Open Transport v1.1, Apple encourages all Mac OS System 7.x users with systems meeting the minimum configuration requirements to take advantage of the increased performance and new features provided by System 7.5.3 and Open Transport v1.1.

Question: Does this mean that Apple expects everyone to stop using current AppleTalk and MacTCP?

Answer: Open Transport is designed to replace current AppleTalk (58.x) and MacTCP (2.0.x) on Apple Macintosh and Mac OS compatible systems meeting minimum configuration requirements. The transition will happen over time, as developers deliver Open Transport-ready and enhanced applications, as users gain experience with Open Transport, and as Apple continues to enhance Open Transport.

Open Transport is not designed to run on 68000 or 68020 Macintosh systems, which should stabilize on current versions of classic AppleTalk and MacTCP software. If Open Transport is installed on these systems, classic networking will still be selected and loaded at system start-up time.

Developers are strongly encouraged to begin all new development for Mac OS using Open Transport.

Question: What files are installed as a part of Open Transport?

Answer: When installed, Open Transport adds the following to the Control Panels Folder:

- AppleTalk - the control panel application replacing the classic Network control panel.
- TCP/IP - the control panel application replacing the classic MacTCP and AdminTCP control panels.

Open Transport adds the following files to the Extensions Folder:

- Shared Library Manager and Shared Library Manager PPC - extensions that implement the Apple Shared Library Manager for 680x0 and PowerPC, respectively.
- OpenTransportLib and Open Transport Library - shared libraries that implement core Open Transport services on PowerPC systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.

- OpenTptAppleTalkLib and Open Tpt AppleTalk Library - shared libraries that implement Open Transport AppleTalk protocols and services on PowerPC systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.

- OpenTptInternetLib and Open Tpt Internet Library - shared libraries that implement Open Transport TCP/IP protocols and services on PowerPC Mac OS systems. The first library contains the modules and APIs for PowerPC native applications; the second for 680x0 applications running in emulation on PowerPC systems.

- Open Transport 68K Library - shared library that implements core Open Transport on 680x0 systems.

- Open Tpt ATalk 68K Library - shared library that implements Open Transport AppleTalk protocols and services on 680x0 Mac OS systems.

- Open Tpt Inet 68K Library - shared library that implements Open Transport TCP/IP protocols and services on 680x0 Mac OS systems.

Depending on the specific system configuration, the following Extensions also may be installed:

- Ethernet (Built-In) - code resource to allow access to built-in Ethernet port.

- Serial (Built-In) - code resource to allow access to built-in serial port.

Open Transport documentation is also provided in electronic format:

- Open Transport Guide Additions - AppleGuide database that updates the Macintosh Guide with information about Open Transport (System 7.5 only);
- a User's Guide (in Acrobat Reader format) which parallels the printed manual;
- the Open Transport Read Me containing any late-breaking news,
- a text file called "Open Transport 1.1 Technical Info" which contains a distillation of this Q&A.

Open Transport 1.1: AppleTalk Features Q & A (3/96)

Revised: 3/8/96
Security: Everyone

Open Transport 1.1: AppleTalk Features Q & A (3/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on AppleTalk features for Open Transport 1.1.

DISCUSSION -----

Question: What are some of the upgraded features of Open Transport AppleTalk?

Answer: Open Transport/AppleTalk now includes new support for assigned (manually administered) protocol addresses. This allows AppleTalk nodes to be managed using protocol address as a unique identifier. It also may reduce the network traffic associated with AppleTalk's dynamic address assignment features (AARP).

Dynamic addressing continues to be available for those customers who prefer automated address allocation.

Question: AppleTalk preferences, such as the last used protocol address and the selected network interface, have been stored in persistent parameter RAM in the past. How does this relate to the new Open Transport network configurations and manual addressing?

Answer: Under the classic AppleTalk networking architecture, AppleTalk's ON/OFF state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name were saved in persistent memory (parameter RAM) for reuse at boot time. To ensure backwards compatibility, this information is still stored and retrieved on systems using Open Transport/AppleTalk.

However, there are some changes made with Open Transport to accommodate the expanded capabilities of multiple, saved configuration files, and required network settings.

- At boot time, Open Transport reads the current Open Transport/AppleTalk configuration file to determine if AppleTalk should be set to ON or OFF. This value will override the value saved in parameter RAM.
- If the network interface specified in the current AppleTalk configuration file is locked (that is, it is a required setting) and the specified port is not available or cannot be initialized, AppleTalk will not automatically switch to LocalTalk; instead AppleTalk will remain OFF. The user will receive notification in the event this occurs.

Question: What happened to the "Network" control panel?

Answer: The Network Control Panel has been replaced by the Open Transport/AppleTalk configuration utility (control panel). This change was made to reflect the function of the utility - to configure AppleTalk network connections.

Question: Are there other changes to the human interface for AppleTalk?

Answer: Yes. The AppleTalk configuration utility now provides basic troubleshooting information. For example, the Advanced and Administrator views provide access to the hardware (Media Access Control) address, current AppleTalk router address and the current AppleTalk network number range for the cable. Previously this information was only available through the use of router administration or protocol analysis software.

Question: Are there other changes to AppleTalk of interest?

Answer: Yes. Beginning with Open Transport/AppleTalk v1.1, AppleTalk now includes integrated support for both multinode and multihomed operation, accessible to developers at the API level. Configuration and use of the second, third, or more network interfaces or protocol addresses requires application program support.

Multihoming is the term applied to the capability to communicate using more than one network interface at a time using the same protocol. This term is taken from the idea that the workstation makes a "home" on more than one network at the same time.

Multinode is the term applied to the capability to communicate through more than one network protocol address at the same time on a given network interface, using a single protocol. This term is taken from the idea that the workstation or PC appears to outside parties to be multiple end-nodes on the network.

Question: Earlier information about Open Transport said that AppleTalk could be dynamically loaded and unloaded only as needed, similar to Open Transport/TCP. Is this feature available?

Answer: This capability has been removed from Open Transport at this time. It

was not technically feasible to provide this feature without creating compatibility problems with existing applications.

Question: Is Open Transport/AppleTalk "AppleTalk Phase 3"?

Answer: No. Open Transport/AppleTalk is a new, modern implementation of the AppleTalk Phase 2 protocol architecture for Mac OS - from the people who invented AppleTalk.

Open Transport 1.1: TCP/IP Features Q & A (7/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on TCP/IP features for Open Transport 1.1.

DISCUSSION -----

Question: What are some of the features of Open Transport/TCP?

Answer: With the broad cross-platform adoption of TCP/IP - and the tremendous visibility of the Internet - Apple has made a significant investment in bringing a workstation-class implementation of TCP/IP protocols to Mac OS. As with Apple's earlier MacTCP, Open Transport/TCP is a full 32-bit stack.

Open Transport/TCP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies;
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol;
- IP multicast, for participation as an MBone client;
- simultaneous TCP connections limited only by installed memory and processor power, for increased functionality as a Internet or other TCP/IP network server;
- a new, more robust and standards-compliant domain name resolver (a caching stub DNR);
- support for developer access to raw IP services, as well as TCP and UDP;

- Ethernet_SNAP and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts;
- implicit and explicit domain name search paths, for increased control of domain name resolution,
- multiple IP routers with fail-over, for increased robustness in mission critical applications.

Question: How does the new support for Dynamic Path MTU discovery work?

Answer: Open Transport/TCP sets the "don't fragment" bit in the IP datagram header on transmission unless the packet size is larger than the MTU for the network. Intermediate routers are required by current RFCs to send back an "ICMP can't fragment" error when presented with a "don't fragment" packet that cannot be forwarded without fragmentation with that MTU size. In that event, Open Transport/TCP moves to the next smaller MTU size for that path and re-sends the packet, again with the "don't fragment" bit set. This process automatically results in using the largest supported MTU size for off-subnet traffic.

Question: How does the new Open Transport/TCP domain name resolver (DNR) work?

Answer: The new DNR implements name-to-address (A), address-to-name (PTR), system CPU and OS (HINFO), and mail exchange (MX) queries. It does not implement negative caching, depending on a local full service resolver to provide this facility. The DNR will always request recursion, but will follow references if recursion is not available.

The DNR caches name-to-address and cname-to-name mappings. It does not cache host info (OS and CPU type information) nor does it cache Mail Exchange/Preference information. It does not save name server references after a query is resolved; further queries begin anew at the configured name servers.

Fully qualified domains names or FQDNs (those ending with a "."), and provisional FQDNs (those containing at least one "." internally but not ending with ".") are submitted for resolution without manipulation. Otherwise the name is assumed to be a partially qualified domain (PQDN).

The first - but optional - step in PQDN resolution is the use of an Implicit Search Path. To be used, Implicit Search must first be configured using the Advanced or Administrator view by entering values in the "Implicit Search Path: Starting Domain Name" and "Ending Domain Name" fields. When so configured the DNR will attempt to change the PQDN to a FQDN for resolution by concatenating the PQDN with domain names in the ancestor hierarchy delimited by the Starting and Ending Domain Name values (that is, searching for a PQDN of joe could result in a search for joe.hardware.support.apple.com, joe.support.apple.com and joe.apple.com). Implicit searching stops when the FQDN is resolved, or when the Ending Domain Name value has been tried and fails (that is, joe.com would not be tried, assuming an Ending Domain Name value of apple.com).

If the PQDN has not yet been resolved (including the case where an Implicit Search Path was not configured), explicit Additional Search Domains are searched. For each Search Domain configured, name server(s) are contacted in the order specified in the Name Servers field. If the name is resolved in the first search domain from which an answer is returned other Search Domains will not be checked. Note that at least one Search Domain (roughly equivalent to MacTCP's Default Domain) must be explicitly configured in order to resolve any PQDNs.

If an authoritative answer that the "name-does-not-exist" is returned, the DNR immediately begins the search in the next configured Search Domain. The search continues through the configured Search Domains.

The DNR has an overall time-out of 2 minutes, after which it will abandon the search.

Question: Does Open Transport/TCP support a local HOSTS file?

Answer: Open Transport/TCP supports one or more HOSTS file, stored in the System Preferences folder, that may be used to supplement and/or customize the domain name resolver's initial cache of information. The selected file is opened and parsed when Open Transport/TCP is initialized. As with MacTCP, the supported HOSTS file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Supported features include blank lines, comments (indicated by a semicolon), and data entry. Comments may begin at any location in a line; they may follow data entry on the same line. A comment extends from the semicolon to the end of the line. Data entry must follow the format:

```
<domain-name> <rr> [<comment>]
```

where <domain-name> is an absolute or Fully Qualified Domain Name, and where

```
<rr> = [<ttl>] [<class>] <type> <rdata> OR [<class>] [<ttl>] <type> <rdata>
```

The only <class> currently supported is IN (Internet Domain); <ttl>, time to live, indicates the record's configured lifetime in seconds; and <type> can be A (host address), CNAME (canonical name of an alias), or NS (name server). If <ttl> is not present the entry is assumed to have an infinite lifetime; this may also be indicated by specifying a value of minus-one (-1). \$INCLUDE and \$ORIGIN are not supported.

Open Transport/TCP is more stringent regarding the content and format of the HOSTS file than was MacTCP, which permitted violation of the PQDN requirement for <domain-name>. For instance, this format:

```
charlie    A 128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie    CNAME myhost.mydomain.edu
```

```
myhost.mydomain.edu A 128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

If a HOSTS file is used, every effort should be made to keep it as small as possible and to only include entries that will be accessed frequently. This reduces the total memory footprint required to cache the DNS information and minimizes the need to maintain and update the HOSTS files as system information changes over time.

In order to activate a HOSTS file, the Advanced or Administrator mode must be used to select the desired file. The text file must already exist; it could have been created with any text editor or word processor. The HOSTS file is tied to the selected configuration. An administrator might, for example, specify different HOSTS files for use when connecting via Ethernet to the campus LAN and when dialing-in from a remote location.

Question: What are some of the changes to the human interface for Open Transport/TCP?

Answer: The Open Transport/TCP configuration application represents a complete overhaul of the human interface from the MacTCP software it replaces. In addition to generic new features noted elsewhere (multiple saved configurations, recommended and required settings, on-line documentation, and so on), key new features include:

- direct entry of IP addresses and subnet mask in standard "dot notation";
- explicit selection of desired configuration method, now including Manual, RARP, BootP, MacIP, and DHCP;
- support for attachment to networks using Classless InterDomain Routing (CIDR);
- support for multiple entries in the router, name server, and explicit domain search lists; and
- improved support for large AppleTalk networks when using MacIP server/gateways.

Question: Does Open Transport/TCP support MacTCP "Server" addressing?

Answer: MacTCP Server mode addressing is a combination of the Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. When Server mode is selected, MacTCP will use BootP to attempt to acquire an IP

address. If BootP fails to provide a valid address it then tries RARP. Whichever protocol is successful is stored as a preference, and is used first on next system startup. While this "fall-back" approach adds a degree of robustness from the users point of view, it also adds a degree of unpredictability from a network administrators point of view.

Based on customer feedback, Open Transport/TCP has been designed to allow a network administrator to explicitly specify the single method they prefer to use. Thus while both RARP and BootP are individually supported, Server mode does not appear as a choice in the Open Transport/TCP configuration utility.

Question: Does Open Transport/TCP support MacTCP "Dynamic" addressing?

Answer: No. MacTCP "Dynamic" mode addressing was based on an Apple-proprietary extension to TCP/IP protocols, which applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks. This made it very easy to set-up a Mac OS only TCP/IP network, but could create additional work for a network administrator in more typical heterogeneous TCP/IP networks.

The Internet community (the IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Apple has adopted the industry standard DHCP and dropped support for the earlier Apple "Dynamic" mode addressing with Open Transport/TCP.

Question: What is MacIP?

Answer: MacIP, sometimes also referred to as KIP (Kinetics Internet Protocol), is a protocol specification developed as a method for carrying TCP/IP traffic on AppleTalk only networks - originally these would have been LocalTalk networks. MacIP is today frequently used in conjunction with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services. MacIP specifies encapsulation of TCP/IP datagrams in AppleTalk packets for transmission over such connections.

Use of MacIP requires a gateway. AppleTalk encapsulated IP packets are sent to the gateway using AppleTalk protocols (DDP). The gateway strips off the encapsulation and places the IP packet on the TCP/IP LAN. When packets are destined for a MacIP end-node, the gateway provides the needed encapsulation services.

MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network, acting as a middleman between the MacIP end-node and the appropriate TCP/IP based hosts on the LAN or WAN.

Open Transport supports MacIP end-nodes. It is selected using the TCP/IP configuration utility by choosing "AppleTalk (MacIP)" in the "Connect via:" pop-up menu. The user (or network administrator) must also specify which zone contains the desired MacIP gateway. Once selected, TCP/IP will be encapsulated in AppleTalk and will be sent to the gateway via the NIC selected using the

AppleTalk configuration utility.

Question: How is MacIP support improved with Open Transport/TCP?

Answer: Open Transport/TCP offers new features in the human interface for selecting the MacIP server, including:

- AppleTalk zones are now displayed in a scrolling list in a movable window. This display is easier to view compared to MacTCP's pop-up menu, especially when there are a large number of zones in the network.
- The Zone list window now supports selection using the mouse, the arrow keys, and/or "type-select", allowing the user to more quickly select a specific zone from the list.
- There is an option to display only those AppleTalk zones containing MacIP servers. When selected, this creates a background search task which when completed filters the zone list display to show only those zones containing active MacIP servers.
- There is a short cut "Current Zone" option which causes the Mac to check the current AppleTalk zone for a MacIP server without requiring the user to select a specific zone. This can be a time-saver for the user and a potential bandwidth-saver on the network, especially when there are mobile users that connect in different locations to a enterprise-wide network for MacIP services.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

System 7.5 Update 2.0: What's New in This Update (1 of 3) (6/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 10 June 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

This file is one of several Read Me files that describe System 7.5 Update 2.0. This three-part document provides details about the changes provided by this software update.

Another Read Me file, "Installing This Update," summarizes the enhancements of this update and gives instructions for installing the update.

What's in this document (part 1 of 3)

- General information about the update
- Changes to the Finder
- Changes to Find File
- Changes to Standard File
- Changes to control panels
- Changes to Apple Guide
- Changes to Apple Menu Options

General information about the update
=====

System 7.5 Update 2.0 provides the enhancements introduced in System 7.5 Update 1.0, plus many more.

In this document:

- Indicates a change made in System Update 2.0 (7.5.3)

- Indicates a change made in System Update 1.0 (7.5.1)

This update installs the latest versions of all components (including any components that you disabled using the Extensions Manager) it finds on the disk it is updating. After you run the Installer, the updated components will be in the same folders as they were before you installed the update. For example, new versions of disabled extensions will be in the "Extensions (Disabled)" folder, and new versions of disabled control panels will be in the "Control Panels (Disabled)" folder.

The file called "System 7.5 Update" replaces the enabler on all computers capable of running system software versions 7.5 and/or 7.5.1. Computers that did not previously need an enabler to work with system software versions 7.5 and 7.5.1 still need the System 7.5 Update file since it contains most of the fixes delivered in this update.

The file called "System 7.5.2 Update" replaces the enabler file on all computers capable of running system software version 7.5.2.

This update includes all of the fixes included with the previously released 7.5.2 Printing Update, the PowerBook 5300 System Software Update, and the PowerBook 2300c Update. You do not need these updates if you install System 7.5 Update 2.0. If you previously installed any of these updates, you should install System 7.5 Update 2.0, since it contains additional fixes.

After you install the update, the About This Macintosh window says "System Software 7.5.3." The window also says "System 7.5 Update 2.0," to indicate the source of the system software.

Changes to the Finder =====

This update includes a new version of the Finder with the following changes:

- When you rebuild the desktop, comments typed in a file's Get Info window are no longer deleted. (Of course, if you delete the desktop database—for example, by making it visible using a utility and then moving it to the Trash—the comments will be lost because the Finder will have to build a new desktop at startup.)
- The Name field (used in Finder windows set to one of the list views) is wider, allowing you to see more characters in filenames.
- On PowerPC-based computers, icons are translucent while you drag them (rather than simply appearing as outlines). If you drag several icons at once, only the icon under the mouse will be translucent—the others will still be outlines.
- Copying large numbers of small files is faster. (Previous versions of the Finder updated the bar in the copy progress dialog box approximately thirty times per second; the new version updates the copy progress bar far less frequently.)
- The Finder Update file (once named PowerPC Finder Update) is now part of the

Finder. This update deletes all old versions of this file.

- When the Clipboard is active, the Clean Up Window command is dimmed. This eliminates a crashing bug in the Finder.
- The Finder flushes the processor's cache more intelligently, improving the Finder speed on all 68040- and PowerPC-based computers.
- Fixes a problem that caused an out-of-memory error when emptying the Trash if QuickDraw GX was installed.
- Fixes a problem that caused seemingly false out-of-memory messages when trying to open or close Finder windows. This problem sometimes occurred when the desktop had very few icons on it, a window with the Kind column was visible, and a large number of different kinds of documents had been displayed since the last restart.
- Fixes a problem introduced by the Finder that shipped with System 7.5 Update 1.0. The Find window of Find File will now be made active if Find File is already open and you choose Find from File menu (or Find File from the Apple menu).
- If you are trying to connect to your computer and your server password has expired or needs to be changed when you try to use an alias to connect to the server, you'll see a message that the password needs to be changed. (Prior versions told the user that the server couldn't be found.)
- File copies are now done asynchronously, which makes the CPU more available to other applications during copying. If another application is made active during a file copy, the computer does not slow down as much. This effect is most noticeable when using Apple Remote Access.
- Finder window titles are now erased before they are overwritten. (Previous versions rendered window titles unreadable in some circumstances.)

This new version of the Finder also includes the following fixes from the prior update's Finder:

- Corrects a problem at startup that could cause the Finder to open the same list of windows over and over again.
- With QuickDraw GX installed, AppleEvents or AppleScript scripts that send Print or Page Setup commands to the Finder are now handled correctly.
- When you try to make changes to a System or Applications folder that is protected by the General Controls panel, the Finder no longer claims there's an access privileges problem. The warning message now describes why the folder can't be changed and how to turn off folder protection.
- Fixes a problem that occurred the first time you started up your computer after installation (or any time you deleted the old Finder Preferences file). One symptom of this problem was a dialog box stating that the Network control panel could not be used.

- Fixes a problem that caused a crash if a sound and a control panel were both in the Startup Items folder and the sound was opened first. (Items in this folder are opened in alphabetical order.)
- The Finder no longer rebuilds the desktop if it finds a folder named Desktop at the root level; now it rebuilds the desktop only if it finds a file called Desktop.
- Improves the way the Finder handles server volumes that are unexpectedly disconnected while files from the server are still open. Now you can save the contents of most files by using the Save As command (in the File menu of most applications). Large files (those that don't fit entirely in memory) might be lost if the server disconnects unexpectedly. With some applications, however, you can copy the contents that are in memory and paste them into a new document, later merging this document with the original file on the server. (With prior versions of the Finder, this situation could lead to serious problems if the user tried saving the document after the server was disconnected.)
- Changes the way the Finder invokes the Find File extension (of System 7.5) instead of the built-in Find feature introduced in System 7.0. The Find File extension now contains a simple "flag" that tells the Finder to use the new Find File. If you disable or remove this extension, the Finder uses only the older built-in Find. This change enables users to choose between the full-scale Find File and its stripped-down version (the built-in Find command).
- Fixes a problem that caused an out-of-memory error if too many Get Info windows were open at the same time.
- Enables users to open a document that belongs to an already-running background-only application. (In previous versions, the Finder searched only through the list that showed up in the Application menu.)
- The Finder Update file was renamed. (It was previously known as the PowerPC Finder Update file.) This file handled Code Fragment Manager (CFM) error-reporting for missing dynamically linked libraries.
- Speeds up copying from servers by letting the server set its preferred block size for copy requests. (Previously, the Finder always requested 4.5K blocks of data from AppleShare or FileShare volumes.)
- Speeds up copying to and from servers by greatly reducing the number of times the Finder checks for user activity during copy operations.
- Speeds up the copying of small files by changing the way the Finder writes parts of the files. (Previously, the Finder rounded up the size of the file being copied to the minimum allocation block size, which, on a 2GB disk, is 64K.) Now the Finder rounds up small files to a multiple of the size of a disk sector (that is, to increments of 512 bytes).
- Fixes a problem in rebuilding the desktop that caused the Finder to skip applications if it encountered a background-only application while rebuilding the desktop database.

- Eliminates problems in opening some applications or having the wrong icon appear. These problems sometimes occurred when, during rebuilds of the desktop, the Finder included applications that did not have the necessary bundle resources. The Finder no longer includes applications that do not have the necessary bundle resources, eliminating confusion within the desktop database.
- The Finder now ignores aliases to applications when rebuilding the desktop database.

Changes to Find File

=====

- The following are the changes in Find File 1.1.2:
 - Includes a list of Shortcuts, available from the Guide menu (with the question-mark icon) when Find File is active.
 - Includes a new preference used in sorting by Kind, "Use full descriptions for found items," which gives more specific Kind descriptions. Using this checkbox results in slower sorts; not using it results in faster sorts but with less specific Kind descriptions.
 - Fixes a crashing bug that occurred if the same item was dragged to the same location before the Finder finished the earlier move.
 - Fixes a bug that allowed non-numeric data to be input into the Size search field.
 - Fixes a bug that allowed a pasted item to exceed the length of several search fields.
 - Fixes a bug that allowed too many digits to be entered in the Size search field.
 - Allows you to drag a volume icon onto the Location pop-up menu.
 - Fixes the zoom box on 68K systems.
 - Changes the alert message to be more informative when a server being searched is disconnected.
 - Changes the way the Found Items list displays items that are in the Trash after the Trash has been emptied.
 - Fixes a searching bug that occurred when the Kind requested was "font."
 - Fixes a crash that sometimes occurred when clicking the Stop button in the sorting dialog box. This dialog box now displays a spinner during a sort.
 - Fixes a memory bug that sometimes occurred after several consecutive searches.
 - Fixes a display bug with Found Items that occurred when using large font sizes.
 - Fixes the CD-ROM icon in the Drives pop-up menu.
 - Enables Find File to find invisible files, some of which you can move (such as the Desktop, Desktop DB, and the Desktop DF files).
 - The Clear menu item now deletes only the selected text. (The Clear key no longer deletes anything.)
 - Fixes a bug that occurred when dragging a file onto the Kind search field. Fonts and applications now show up as such, not as documents.
 - Fixes a crash that sometimes occurred when dragging an item from the Found Items window to the desktop.
 - Changes the prompt message when search fields are empty.
 - Cleans up Balloon Help.

- Includes a new preference to specify transliteration.
- Speeds up searches in 2-byte languages if no transliteration is necessary to perform the search.
- Fixes a bug where the filename input for 2-byte languages could exceed maximum length.

•The following are changes introduced with System 7.5 Update 1.0 (Find File 1.1.1):

- Fixes a drag problem with large groups of items. Now Find File displays a confirmation dialog box when you drag more than 50 items.
- Fixes a crashing bug when searching for items whose names contain "desktop." Find File no longer finds invisible desktop files unless explicitly requested.
- Fixes a bug that prevented exact-name matches with foreign file systems.
- Fixes the "spontaneous search" bug, whereby Find File could start searching without any criteria entered. Find File now displays an alert prompting for search information.
- Fixes a bug that sometimes prevented an item in the Found list from being selected by clicking its icon.
- Fixes a memory problem in sorting more than 1100 items.
- Fixes a highlighting problem with the Keyboard menu.
- Scroll bars are now properly drawn.
- Fixes a cosmetic problem with drag-selecting items in the Found list.
- Properly updates the path in the bottom of the Found list window after the user drags items from the list.
- Fixes a hanging bug that could occur when dragging a folder onto the search fields.
- Fixes a pop-up menu bug that sometimes showed the wrong value after switching to the Finder and back to Find File.
- Fixes the search when the Comments field is left blank.
- Fixes Balloon Help for the More Choices button.

Changes to Standard File

=====

- Fixes an occasional crash in Standard File that occurred when the data cache was not flushed before being disabled.
- Fixes a memory leak with some of the dialog boxes used for opening and saving documents in Standard File.
- Fixes a problem in the dialog box used for opening files that could allow the pop-up menu to be dimmed in Standard File.

Changes to control panels

=====

- PowerPC-based computers with PCI slots now use the Monitors & Sound control panel, instead of the Sound & Displays control panel, to control monitor and sound settings. (System Update 2.0 removes Sound & Displays.) You can do a custom installation to install the Sound control panel if you need it for older applications. (The Monitors & Sound control panel works only on PCI-based computers.)
- The Memory control panel now displays "Will be off after restart" if Virtual

Memory is turned off, as a reminder that just turning Virtual Memory off does not fully deactivate it.

- The Memory control panel now uses a larger default setting for the Disk Cache. After you install this update, the new setting will be used only if the Use Defaults button in the Memory control panel is clicked. The new default is 32K for each megabyte of physical RAM installed, up to a maximum of 4096K. (Virtual RAM is ignored for this calculation.) Thus, a computer with 16MB of physical RAM would use 512K for its default disk cache size, resulting in better performance for disk-intensive tasks than the original default of 96K.

- Fixes a bug in resizing a RAM disk in the Memory control panel while File Sharing is on.

- Fixes a problem in General Controls panel that caused problems with Retrospect Remote if either application or System Folder protection was turned on.

- Includes a new option in the General Controls panel: "Folder that is set by the application." Clicking this option sets the default folder to the folder containing the document being opened. Thus, when you open a document by double-clicking its icon, the default folder will be set to the folder containing the document (instead of to the Documents folder or to the folder containing the application that opened that document).

- Fixes a problem in General Controls panel that could hang the computer if Applications folder protection was turned on and there was a document or alias named "Applications" at the root level of the startup disk.

- Fixes a problem in the General Controls panel's folder-protection code that could cause folders to become invisible if Stuffit Spacesaver was installed.

- CloseView no longer uses key combinations that were already used by the Finder. The new key combinations for CloseView are:

- Command-Option-K: turns CloseView on or off
- Command-Option+= (the plus sign): increases magnification
- Command-Option-- (the minus sign): decreases magnification

- If CloseView is active, it remains active after you change your monitor's bit depth.

- CloseView no longer hangs the system if Balloon Help is on and an audio CD is inserted.

- Includes the following new international keyboard layouts:

- French Canadian
- ISO Canadian
- Spanish

- Installs the updated versions of the following international keyboard layouts if older versions are already installed:

- Dutch
- Flemish

- German

Changes to Apple Guide

=====

- This update includes Macintosh Guide 1.3 (and several new Guide Additions files), which provides updated onscreen help for system software.

- This update includes Apple Guide version 2.0.2, which includes the following improvements:

- Fixes problems with displaying coach marks in modal dialog boxes.
- Fixes a serious memory leak that occurred every time a Guide file was opened.
- Fixes a problem that caused every twenty-first index item to disappear when multiple additions were in use.
- Fixes a problem that occurred when Apple Guide encountered additions files that did not apply to the current configuration of hardware and system software (for example, if the QuickTime Guide were installed, but QuickTime was not installed or had been turned off with Extensions Manager).
- Defaults to US ASCII sorting only if the current script is Roman and the current language is English. (Apple Guide 1.2.5 defaulted to US ASCII on any Roman script system.)
- Fixes problems with coach marks on 68K machines. (Coach marks were sometimes drawn on the wrong menus.)
- Fixes a Look For problem in Japanese systems by first trying to use the script code from the current database.
- Fixes a bug in <Delete Index> that affected Japanese systems.
- Fixes problems with mixed-mode handling of installed coach and context handlers.
- Fixes a problem that sometimes caused Apple Guide to shut down completely on PowerPC-based computers. For example, if a PowerBook additions file was present on a PowerPC-based desktop computer, Apple Guide 1.2.5 would completely shut down because the additions file couldn't be used. Now, Apple Guide ignores the PowerBook addition and continues running.
- Fixes a problem that prevented Apple Guide 1.2.5 from starting up if QuickTime wasn't installed on the machine. This problem occurred only on PowerPC-based computers.
- Includes localizable error strings for use in various abort messages.

- This update also includes all the improvements to Apple Guide introduced with System 7.5 Update 1.0 (Apple Guide 1.2.5):

- Works faster than prior versions on all Mac OS-based computers.
- Is native on PowerPC-based computers, which also improves performance.
- Is compatible with At Ease.
- Makes additions files available in the Guide menu even if the application was opened with AppleScript.
- Fixes a memory leak of an international resource, which occurred every time a Guide file was opened.
- Makes windows redraw correctly after coach marks are drawn.
- Updates no more of the screen than it needs to.
- Properly draws coach marks in black and white and on a mirrored monitor.
- Keeps scroll bars active when they should be active.

Changes to Apple Menu Options

=====

- Includes Apple Menu Options v.1.1.2, which introduces the following changes:

- Has been largely rewritten for better performance and improved stability.
- Fixes a problem that could hang the computer when the Apple Menu Options preference file was dragged to the Trash.
- Fixes a problem that could hang the computer if there was a locked alias in the Recent Documents, Recent Applications, or Recent Servers folders. The new version ignores locked aliases.
- Moved a large 68K patch that caused a general slowdown on PowerPC-based computers. This patch is now active only while the mouse button is held down on the menu bar or in a menu.
- Increases the height of the editing field used for entering the number of documents, applications, and servers.
- Fixes a problem that could prevent the Recent Documents, Recent Applications, and Recent Servers folders from being deleted when tracking of those items is turned off.
- Fixes a problem that could cause Apple Menu Options to hang if its settings were changed and the System Folder was on a locked volume (such as a startup CD or locked floppy disk). The hang would occur when Apple Menu Options tried to write the new settings into the locked preferences file. The new version does not try to record new settings on a locked volume.
- Fixes a problem with sorting order; Apple Menu Options no longer uses the U.S. standard for modified Roman and Scandinavian alphabets.
- Prevents Apple Menu Options from deleting original files—it can now only delete aliases. (This change solves a problem that occurred when users saved documents directly into the Recent Documents folder. Once the document was saved, Apple Menu Options replaced the file with an alias to that file.)
- Fixes a problem that sometimes caused the contents of the Apple menu to show up in place of the proper contents for submenus.

- Incorporates all of the prior fixes to Apple Menu Options:

- Improves performance.
- Fixes a problem that could cause an application's menus to disappear.
- Fixes a problem that could leave the Apple menu highlighted if an application was opened from a submenu within the Apple menu.
- Shows non-AppleShare servers in the Recent Servers sub-menu.

System 7.5 Update 2.0: What's New in This Update (2 of 3) (9/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 19 September 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

This file is one of several Read Me files that describe System 7.5 Update 2.0. This three-part document provides details about the changes provided by this software update.

Another Read Me file, "Installing This Update," summarizes the enhancements of this update and gives instructions for installing the update.

In this document:

- Indicates a change made in System Update 2.0 (7.5.3)
- Indicates a change made in System Update 1.0 (7.5.1)

What's in this document (part 2 of 3)

- Changes to SimpleText
- Changes to the Launcher
- Other new or changed components
- Miscellaneous fixes and enhancements
- Files no longer needed

Changes to SimpleText

=====

- Includes SimpleText version 1.3.1, which supports QuickDraw 3D.
- Includes the following enhancements introduced with the version of SimpleText

provided with System 7.5 Update 1.0:

- Large documents, PICT files, and page ranges (for example, pages 2 and 3 of a 5-page document) print correctly.
- Page Up, Page Down, and scrolling work better with Portable Digital Documents (PDDs) and other documents.
- Editing features (such as Cut, Copy, the forward delete key on extended keyboards, underlining, and selected text highlighting) work correctly.
- SimpleText documents that use system fonts now retain their fonts when opened on a computer with a different system font.
- Remote program linking (controlling SimpleText with AppleScript from another computer) is enabled by default.
- In the Don't Save/Save/Cancel dialog box, you can type "D" or Command-D for Don't Save.
- If you choose Quit with an unsaved document, and want to cancel the quit, you can do so by choosing Save in the Don't Save/Save/Cancel dialog box, then choosing Cancel in the Save dialog box.

Changes to the Launcher

=====

• This Update includes Launcher version 2.8 which incorporates minor "behind the scenes" changes not likely to be visible to users.

• Launcher version 2.8 also includes the following fixes and functionality, introduced in System 7.5 Update 1.0:

- Supports Macintosh drag and drop, making it easier to add or remove items.

To add an item: Open the Launcher and drag the item into the Launcher window or onto a category button. The system creates a new Launcher button for the item by placing an alias in the Launcher Items folder. The original item remains on your hard disk.

To remove an item from the Launcher: Hold down the Option key and drag the button out of the Launcher.

To move a Launcher button to a new category: Hold down the Option key and drag the button to a category button along the top of the Launcher window.

To open a file using the Launcher: Drag the file's icon onto a Launcher button that represents an application program. For example, you can open a SimpleText file by dragging its icon onto the SimpleText button. If the program the button represents can open the file, the button is highlighted when you drag the file to it.

To put a file into a folder: Drag the file's icon onto the Launcher button that represents the folder.

To resize the currently visible Launcher buttons: Hold down the Command key and click inside the Launcher window. Then choose a new size from the pop-up menu.

To open a category button's folder (located in the Launcher Items folder): Hold down the Option key and click the category button.

Other new or changed components

=====

- Includes Open Transport v.1.1, a major re-implementation of the network system software for use on all 68030-, 68040-, and PowerPC-based computers except the desktop 5200, 5300, 6200, and 6300 series computers. After an Easy Install, Open Transport will be active only if it was active before the update was installed (it cannot be active on desktop 5200, 5300, 6200, and 6300 series computers). For more information, see the Open Transport Information folder, inside the Apple Extras folder.
- Includes a small application called Network Software Selector (NSS), which enables users of 68030-, 68040-, and early PowerPC-based computers to choose between Open Transport and classic AppleTalk if both are installed. (You must restart the computer for the change to take effect.) PCI-based computers support only Open Transport.

NSS is in the Apple Extras folder; information on using it is built into the application. NSS is intended to ease the transition to Open Transport by allowing you to use the older networking software if there is a compatibility problem with an application and Open Transport. Once the problem is resolved, you should switch back to Open Transport.

Note: Because MacTCP is incompatible with Open Transport v.1.1, MacTCP is disabled any time Open Transport is selected using the Network Software Selector. (Open Transport uses the TCP/IP control panel instead of MacTCP.) If, however, you reselect classic AppleTalk, MacTCP is enabled again.

- For users of the older networking software, this update includes MacTCP 2.0.6, which

- shortens retransmission delays
- prevents potential out-of-memory errors
- makes configuring communications easier
- gives users more control over which servers to contact and in what order

- Includes SerialDMA 2.0.2 for use on all PowerPC-based computers, the Centris 660AV, Quadra 660AV, Quadra 840AV, as well as the corresponding Performa and Apple Workgroup Server products. SerialDMA provides a complete rewrite of the DMA serial driver which originally accompanied these computers, thus fixing the occasional system hang, communications timeouts, poor communications performance, and other glitches. The new SerialDMA 2.0.2 driver not only corrects these problems, but also exceeds the performance and reliability standards for serial communications on the Mac OS platform (providing support for speeds of up to 230,400 baud).

- SerialDMA 2.0.2 is native on the PowerPC-based computers.

- Includes a new version of Apple Modem Tool (1.5.5), which supports 115.2K and 230.4K connections on SerialDMA 2.0 machines.

- Includes the latest version of PC Setup (v1.0.7) for use with all DOS Compatible Mac OS computers.

- Includes Screen control panel version 1.0.7. This new version does not crash

if it's in the System Folder of a Macintosh SE during startup or when it's opened on any 68000-based Mac OS-based computer.

- Includes File Sharing 7.6.2, which includes several improvements over previous versions. Now, when file sharing is turned on, removable disks and CD-ROM discs will automatically be shared (except for audio CDs, which will no longer be shared). To eject a removable disk or CD-ROM disc, you no longer have to turn off File Sharing, as long as no other user is currently connected to the shared volume.

- Includes a faster version of the AppleShare Workstation client software. The new version performs read-ahead and write-behind caching, allowing the Finder to write to a local volume while reading from a remote volume (and vice-versa). The new version also briefly caches some information from the desktop database to avoid unnecessary hits to the disk.

- Includes Apple Video Player 1.4.

Miscellaneous fixes and enhancements

=====

- The Shut Down warning, which appears during startup if the computer was shut down improperly, dismisses itself after two minutes so that startup isn't delayed when no one is around to read the message. Note that this warning can be turned off completely in the General Controls panel.

- Includes Macintosh Easy Open 1.1.2, which fixes delays when dragging Finder folders.

- The dialog box displayed after the keyboard Power key is pressed dismisses itself (simulating a click on its Cancel button) after one minute.

- Fixes a problem with the Power key. In previous versions, if the Power key was held down just a little too long, the hardware could miss the release of the key. If the next key pressed was the Command key, the hardware would mistakenly think that Command-Power had been pressed and would bring up the programmer's window (or MacsBug if it was installed).

- Color Picker no longer crashes during startup. There is a problem with certain third-party SCSI drivers that mark the drive as removable at the beginning of startup and later mark it as non-removable. Because Color Picker creates an alias to itself during startup, the change to non-removable prevented the Color Picker alias from being resolved later. Color Picker now handles the failure to resolve this alias.

- Fixes a problem introduced by System 7.5 Update 1.0 that prevented 2-byte characters from being used when naming a DOS disk.

- Fixes a problem that allowed the Menu Manager to use an unlocked handle. This fix will eliminate some crash problems, especially when using certain pop-up menus.

- Changes several video drivers to provide better support for new monitors introduced since System 7.5 was released.

- Handles low-memory situations better than previous releases of Sound Manager.
- Fixes a problem that allowed the sound volume to be lower after restarting than it was before restarting; volume should now be properly preserved when restarting.
- The state of the Mute checkbox in the Sound control panel's Volume window is now preserved across restarts.
- Fixes a problem that allowed QuickDraw to leak about 50 bytes of memory in some isolated circumstances.
- Fixes a problem that allowed a nonexistent disk drive to show up in Disk First Aid.
- Fixes a crash problem in the Communications Toolbox that happens if there are more than about 600 zones on a single network. The new limit is just over 8000 zones.
- Fixes a problem on the 630 and 5200 series computers that would cause them to ignore the infrared remote control.
- Fixes a problem that made it take two attempts to unmute the sound using the infrared remote control on 630 and 5200 series computers.
- Presents a dialog box that advises users that audio CDs cannot be shared if an audio CD is selected and the "Share a Folder" or "Share a Folder (no Guest)" automated task is executed. (In the past, the system would hang in this situation.)
- Fixes a bug that caused the wrong font to be used in some cases.
- Fixes a problem that allowed a garbage pattern to be used when redrawing the pattern in a scroll bar.
- Fixes a problem with submenus drawn too large or not drawn at all.
- Fixes a problem that sometimes caused the startup progress bar to draw improperly.
- Fixes a problem in WorldScript Power Adapter that could cause text to wrap randomly in Text Edit fields, or to appear garbled.
- Plugged a small memory leak that sometimes occurred when resizing a window.
- The Power key can now be used to turn the computer off. To shut down the computer, press the Power key. When the dialog box appears, you can shut down your computer, restart your computer, put it to sleep (if it supports sleep), or cancel the shutdown. PowerBook 100 series computers do not have a Power key on their built-in keyboard, but if you attach an external keyboard, you can use the keyboard's Power key (as just described) to turn off the computer. This

functionality is not supported on the Macintosh Plus.

- The Synchronize Folders AppleScript automated task handles nested folders properly.
- A new AppleScript automated task-Share a Folder (No Guest)-lets you automatically share a folder with the Guest access disabled.
- Improves system stability when memory is very low.
- Fixes a potential crash problem when shutting down or restarting Japanese systems with QuickTime 2.0 installed.
- Fixes a potential crash problem when pasting large amounts of data.
- No longer opens the wrong original when you select an alias on the desktop of a disk other than the startup disk.
- No longer interferes with custom colors that some applications use in the Open and Save dialog boxes.
- Fixes a potential crash problem that occurs when Stickies opens with a "collapsed" note window.
- Fixes a problem that would allow the Options button in Sound control panel's Sound In window to be dimmed when it should be enabled.
- Fixes sound problems in the Jigsaw Puzzle (caused by a third-party extension).
- PowerTalk Catalogs Extension version 1.1.1 no longer displays an out-of-memory error when you open a catalog.
- PowerTalk AppleMail version 1.1.2 works better on systems with many fonts installed and defaults to "sender only" for mail replies.
- PowerTalk DigiSign Utility version 1.1.1 improves printing on HP DeskWriter C and 550-style printers.
- Direct Dialup version 1.1.1 works better when dialing using a long string and won't time out while sending a large letter or a letter with a large enclosure.
- Fixes a potential crash problem that occurs if both PowerTalk and At Ease are installed. While PowerTalk and At Ease no longer crash when used together, accessing all of Power Talk's functionality requires the Finder (open the Special menu in At Ease and choose Go To Finder).
- Command-Option-Space bar no longer changes the keyboard layout if multiple layouts are installed. This avoids a conflict with some popular games that used these keys for controls within the game, resulting in a seemingly random layout being selected once the game is finished (during the game, the selected layout would change any time the three keys were pressed at once). If you want this functionality restored, open the Keyboard control panel and click the checkbox

at the bottom. The conflict with certain games will exist as long as this box is checked.

- WindowShade version 1.3.1 fixes a potential crash problem that occurs when memory is very low.
- Macintosh Easy Open version 1.1.1 works better with drag-and-drop on document converters.
- Fixes a problem in the Menu Manager that could cause memory fragmentation within an application's heap.
- File Sharing no longer causes a crash when Find File is searching a remote volume using Apple Remote Access.
- Fixes a problem in file sharing that caused some files not to get copied. (The symptom of this problem was a dialog box stating that the file could not be copied because it couldn't be found.)

Files no longer needed

=====

The Update automatically deletes the files listed below—unless you renamed any of them, in which case, you should remove the files.

•• Several standalone files are now merged into the System 7.5 Update enabler or the System file. This update deletes the old (standalone) versions of the following files:

- 7.5.2 Printing Fix
- 040 VM Update
- 601 Processor Card Enabler
- 630 SCSI Update
- CFM Updater
- Color Classic Update
- Color Classic Update
- Display Enabler 2.0
- EM Sound Update
- MathLib
- Mount IDE Drive
- Network Software Installer (v1.5.1 and later)
- PowerBook 150 Update
- PowerBook 2300c Update
- PowerBook 5300/2300/190 Enabler
- PowerPC Enabler
- SCSI Manager
- SCSI Manager 4.3 (a renamed version of SCSI Manager)
- Serial Update 406
- SerialDMA
- Sound Manager
- System Enabler 406
- ThreadsLib
- Workgroup Server Enabler

•• Several standalone files have been merged into the System 7.5.2 Update

enabler. The update deletes the old (standalone) versions of the following files:

- 7.5.2 Printing Fix
- CFM Updater
- PowerBook 5300 Enabler
- PowerBook 5300/190 Enabler
- SerialDMA
- Sound Manager
- System Enabler 701
- ThreadsLib

•• Several standalone files have been merged into or been replaced by various other pieces of the system. The update deletes the old (standalone) versions of the following files:

- Sound & Displays (replaced by Monitors & Sound)
- Apple Multimedia Tuner (rolled into QuickTime 2.1)
- LaserWriter 8.0 (replaced by LaserWriter 8)
- PowerPC Finder Update (renamed in System 7.5 Update 1.0 and merged into the Finder)
- Finder Update (rolled into the Finder)

System 7.5 Update 2.0: What's New in This Update (3 of 3)(10/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 4 October 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

This file is one of several Read Me files that describe System 7.5 Update 2.0. This three-part document provides details about the changes provided by this software update.

Another Read Me file, "Installing This Update," summarizes the enhancements of this update and gives instructions for installing the update.

In this document:

- Indicates a change made in System Update 2.0 (7.5.3)
- Indicates a change made in System Update 1.0 (7.5.1)

What's in this document (part 3 of 3)

- Changes for PowerPC-based models
- Changes for PowerBook and Duo models
- Changes for other 68K-based models
- Changes for PC cards
- Changes for AppleVision monitors
- Changes related to printing
- Changes related to networking
- Known problems and their workarounds
- Tips

Changes for PowerPC-based models
=====

- PowerPC-based computers with PCI slots now use the Monitors & Sound control panel to control monitor and sound settings instead of the Sound & Displays control panel. (System Update 2.0 removes Sound & Displays.) You can do a custom installation to install the Sound control panel if you need it for older applications. (The Monitors & Sound control panel works only on PCI-based computers.)

- Includes native SCSI (not on desktop 5200, 5300, 6200, and 6300 series computers).

- Fixes a SCSI Manager problem that would hang any PowerPC-based computer if a Sony or WangDAT DAT drive was used with Retrospect.

- Fixes a problem on desktop 5200, 5300, 6200, and 6300 series computers running QuickTime 2.1 that would prevent sound from being heard in Fusion Recorder's Record window until either a recording was started or the TV volume in the Sound control panel was unmuted.

- Includes both native and 68K versions of common Modern Memory Manager routines, improving performance of emulated applications by speeding up calls to common routines. (System software version 7.5 and 7.5.1 included only the native implementations, while system software version 7.5.2 included both native and 68K versions.)

- Includes a rewritten fixed-point math library to provide better performance for QuickDraw, other parts of the system, and all applications that use this library. Because QuickDraw and other parts of the System use this library extensively, installing this update will cause noticeable performance gains.

- PowerPC-based computers with PCI slots might have a different physical Ethernet address after you install this update. The update fixes a bug that caused an incorrect physical Ethernet address to be used in environments where TCP/IP addresses are obtained using BootP, DHCP, or RARP. To see the new Ethernet address after you install the update, open the File menu in the AppleTalk or TCP/IP control panel and choose Get Info. If you install the update and are no longer able to use your TCP/IP-based applications, contact your network system administrator.

- On PowerPC-based computers (including those with PowerPC Upgrade cards) running system software version 7.5 or 7.5.1, this update introduces the Native Resource Manager. This version of the Native Resource Manager is slightly newer than the version released with system software version 7.5.2. The System 7.5.2 Update file includes the same improved version of the Native Resource Manager.

- Reduces times to open applications on PowerPC-based computers with virtual memory turned on. System 7.5.2 (not 7.5 or 7.5.1) would significantly slow down while opening certain applications, such as Microsoft Excel version 5.0, if virtual memory was turned on. With Update 2.0 installed, launch times should be about the same whether or not virtual memory is turned on.

- Fixes a bug affecting plug-ins that import from an application. This problem existed in all PowerPC-based computers running system software versions 7.1.2,

7.5, 7.5.1, and 7.5.2. and was originally fixed by the CFM Updater extension (distributed with QuickDraw 3D). Update 2.0 deletes this extension, which is no longer needed.

- Fixes a bug in starting up from removable media with virtual memory on. (Although this bug was fixed in 7.5.2, it still exists in 7.1.2, 7.5, and 7.5.1 PowerPC computers.)

- Fixes problems with the DR Emulator. (The DR Emulator works only on PCI-based computers and the PowerBook 2300, 5300, and 500 upgrade.)

- Fixes a problem in certain IDE drives that resulted in cached data not being written to the disk at shutdown.

- Fixes anti-aliasing errors for Kanji Type 1 fonts.

- Fixes a problem that resulted in off-white often being drawn as white. (This effect, while generally subtle, was significant enough for some applications to merit a fix.)

- Fixes a crash problem (a Type 11 error) in Native QuickDraw; this error occurred when using Quark XPress v3.1.1 with system software versions 7.5 and 7.5.1. System 7.5.2 corrected this problem. If you still have Type 11 errors when using Quark XPress 3.3.1 with System 7.5.3 on a PowerPC-based computer, try upgrading to QuarkXPress 3.3.2.

- Fixes a problem in the Dialog Manager that caused some applications to crash after a dialog box was dismissed.

- Supports DayStar Turbo 601 cards in a Macintosh IIci or IIsi.

- If you use Microsoft Office 4.2.1, you need the extension "Office 4.2x Update For Power Mac," version 1.0.1, and the Microsoft Office Manager control panel, version 4.2.1b. You can download these files from the Internet. Download the MC1164.HQX and MOMPATCH.HQX "patch" (update) files from Microsoft. The patches are available on the Internet at

<ftp://ftp.microsoft.com/softlib/mslfiles>

- Includes changes to native QuickDraw which speed up operations such as scrolling, image filtering, and pattern and text drawing. ("Native QuickDraw" refers to time-critical portions of QuickDraw that have been native since the initial release of PowerPC-based computers.

- Updates video software, thus prevent video scrambling during computer startup.

Changes for PowerBook and PowerBook Duo models
=====

- Contains a new version of password security software. The version that shipped with the PowerBook 5300 and the PowerBook 190 computers could lock out international users since the software to handle international keyboards does

not load until after the password is requested during startup. If the password contained a character that was not available on a U.S. keyboard, it could not be entered and the computer could not finish starting up. The new version of the password security software fixes this problem.

- Fixes a problem in the Assistant Toolbox that caused the Assistant Toolbox to be incompatible with Open Transport.

- Fixes a problem that prevented PowerBooks and PowerBook Duos from going to sleep if SimpleText or certain other applications were running in the background.

- Fixes problems with the DR Emulator. (The DR Emulator works only on PCI-based computers and the PowerBook 2300, 5300, and 500 upgrade.)

- PowerBook Duo docks: Pressing the eject button automatically opens items in the Shutdown Items folder and shuts down the computer. No dialog box appears.

- PowerBook 500 models: Improves trackpad performance.

- PowerBook 150: Extends battery life by reducing power requirements during sleep mode. It also prevents the system from freezing when you repeatedly use the internal modem without restarting the computer.

- PowerBook 150: Eliminates the need for the PowerBook 150 Update system extension. Installing Update 2.0 automatically removes this extension from the Extensions folder (inside the System Folder).

- PowerBook 150: Fixes a problem that prevented the internal IDE disk from appearing on the desktop. The problem occurred if the internal IDE disk was selected as the startup disk, and the Command-Shift-Option-Delete keys were held during startup (to start up from an external hard disk).

Changes for other 68K-based models

=====

- Quadra 900 and 950: Fixes a problem in the Sound control panel. Before this update, the External Line and Internal CD buttons in the Sound control panel were reversed, so that clicking the Internal CD button was interpreted as though the External Line button had been clicked (and vice-versa).

- Quadra 950: Fixes a problem with the Sound control panel. Before this update, clicking the Add button sometimes caused the computer to crash.

- Centris 660AV, Quadra 660AV, and Quadra 840AV: Includes Apple Video Player v.1.4, which replaces the Video Monitor application (which is no longer supported).

- Quadra 840AV, Quadra 660AV, and Centris 660AV: Includes new video software that prevents video scrambling during computer startup.

- Quadra 840AV, Quadra 660AV, and Centris 660AV: Fixes a problem in the Dialog Manager that caused some applications to crash after a dialog was dismissed.

- Performa 630, Quadra 630, and LC 630 with internal IDE drives: Fixes a problem that prevented the internal IDE disk from appearing on the desktop. The problem occurred if the internal IDE disk was selected as the startup disk, and the Command-Shift-Option-Delete keys were pressed during startup (to start up from an external hard disk).

- Quadra 700: Fixes a potential problem that could slow down the mouse or trackball.

- Quadra 840AV: Includes an updated Display Manager which ensures that a multi-sync monitor is set to the correct resolution when you restart the computer.

Changes for PC cards

=====

- Macintosh Easy Open version 1.1.1, which is installed with this update, fixes problems with cut and paste between Mac OS and PC applications on Mac OS-based computers with a PC card installed.

- Quadra 610 and Centris 610 computers with the 610 PC card installed receive PC Setup version 1.0.2 (software that was inadvertently not provided with the upgrade disks for System 7.5).

Changes for AppleVision monitors

=====

- If you use AppleVision software, use version 1.0.2 or later. Earlier versions of AppleVision are not compatible with System 7.5 Update 2.0.

- If you have a 1710AV monitor and a PCI-based computer, use AppleVision 1.0.4 and the Monitors & Sound control panel.

- If you have a 1710AV monitor and a non-PCI-based computer, use AppleVision 1.0.2, the Sound control panel, and the Monitors control panel.

Changes related to printing

=====

- Includes version 2.1.1 of the StyleWriter 1200 driver, which fixes a crash bug on System 7.5.2-capable computers.

- Includes the LaserWriter 8F (version 8.2.3F) driver, which supports all the fax options on the LaserWriter 16/600. The LaserWriter 8 (version 8.3.3) driver, which is also included in Update 2.0, does not support all these fax options.

- Supports QuickTime compressed images and ColorSync 2.0 through the LaserWriter 8 (version 8.3.3) driver.

- The LaserWriter 8 (version 8.3.3) and LaserWriter 8F (version 8.2.3) drivers contain fixes for two common printing problems found on PCI-based computers: freezing when trying to print to a printer that's busy, and freezing when trying

to print large documents or printing to LocalTalk-based printers.

- The LaserWriter 8F, version 8.2.3, printer driver provides the following enhancements (introduced in version 8.2):

- Improves the function of the Setup button in the Chooser; this button automatically looks for the selected printer, selects the appropriate PostScript Printer Definition (PPD) file, and configures the paper trays. (If you prefer to manually configure the PPD files and paper trays, you can do so by clicking the Setup button a second time.)

- Resets the destination in the Print dialog box to Printer instead of retaining the previous print job's destination. For example, if the previous destination was Fax, the destination automatically resets to Printer for the next job.

- Enables you to tab backwards through the fields in all print dialog boxes by pressing Shift-Tab.

Note: Installing the LaserWriter 8F version 8.2.3 printer driver removes the LaserWriter 8 Prefs file from your system. Thus, after you install, you need to set up your printer using the following steps:

1. Open the Chooser.
2. Click the LaserWriter 8 icon.
3. Click the printer you want to use.
4. Click the Setup button.

Changes related to networking

=====

On computers with 68030, 68040, or PowerPC processors, Easy Install automatically installs Open Transport networking software, which provides improved network flexibility and performance. Open Transport is available on all computers with 68030, 68040, or PowerPC processors except for the desktop 5200, 5300, 6200, and 6300 series computers. Open Transport will be active only if it was active before the update was installed (otherwise, classic AppleTalk is active). If your computer is not PCI-based, you can use the Network Software Selector (NSS) to switch between Open Transport and classic AppleTalk. You'll find the NSS utility in the Apple Extras folder after you install System 7.5 Update 2.0.

Switching from Open Transport to classic AppleTalk usually causes the network connection to revert to LocalTalk. After you switch networking software and restart your computer, you can use the Network control panel (classic AppleTalk) or the AppleTalk control panel (Open Transport) to reselect the desired network connection.

Depending on your system and networking needs, Open Transport may require 400K-1200K more RAM than classic AppleTalk. In many cases, you can reduce this amount by turning on Virtual Memory.

For more information, see the Open Transport Information folder, inside the Apple Extras folder.

Known problems and their workarounds

=====

- Apple Video Player displays an incorrect dialog box if it's opened on a computer that does not have video-in capability. Apple Video Player complains that the Video Startup extension was not installed properly instead of stating that video-in is required for this application to run.

- If, when you try to print, you see a message that your printing preferences are missing or damaged, open the Chooser and select a printer.

- Some versions of the LaserWriter driver (version 7.2 and earlier) and the QuickDraw GX printer drivers still have the problems that interfere with PCI-based computers trying to print on a busy printer or trying to print large documents. If you experience these problems, select the LaserWriter 8.3.2 driver from the Chooser.

- Two different control panels are named "Energy Saver." The older version worked by dimming the external screens of certain computers. The newer Energy Saver, which works differently, works only on PowerPC computers with PCI slots.

The universal System Folder that can be created by Update 2.0 contains only the newer Energy Saver. If your universal System Folder requires both versions of the Energy Saver, do the following:

1. Rename the newer Energy Saver.
2. Use Custom Install to install the older Energy Saver.

- The new minimum RAM disk size is 416K. If a smaller RAM disk exists during the installation of this update, it will be turned off and its contents lost when the computer is restarted. Therefore, before installing this update on a computer with a RAM disk smaller than 416K, move all the contents of the RAM disk to another disk.

- Digital audio recording and playback can occasionally "skip" if virtual memory is turned on. To reduce this skipping, turn off virtual memory.

- HyperCard version 2.3.3 or earlier does not record sound properly on computers with PCI slots. Other sound recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within HyperCard 2.3.

- When used with SerialDMA, DOS Compatibility software will not be able to use hardware handshaking on the PC serial port.

- There is an incompatibility between AppleShare Workstation software version 3.6.1 and Connectix Speed Copy (part of Speed Doubler version 1.1 or earlier). Use the Extensions Manager to turn off Speed Copy before you install this update, and contact Connectix to get the latest version of Speed Doubler. (You can contact Connectix at <http://www.connectix.com>, 415-571-5100, or 800-950-5880.)

- If you have a PowerBook 190 with Open Transport active: If you are using the IR port and networking doesn't work after you restart the computer, try putting the computer to sleep and waking it up, or choose the printer/modem port and then switch back to the IR port.

- If you have a PCI-based Mac OS computer connected to a Novell Netware network: This update contains the Ethernet Compatibility extension version 1.0.3, which fixes a problem in the system shutdown code. To use this extension, you need to Custom Install the Ethernet Driver Update. A side effect of this fix is a two-minute delay in shutting down the computer.

- When using Drive Setup (version 1.0.4 or earlier) on some IDE hard drives, the "Update driver," "Customize volume," and "Test disk" options are dimmed. To use these options, back up all data on the IDE disk (onto another disk), and use Drive Setup to reinitialize the IDE disk.

- If you have a Macintosh Centris 660AV, Quadra 660AV, or Quadra 840AV, some system alert sounds may not play correctly with the alert volume turned down. To avoid the problem, keep the alert volume turned all the way up and adjust the Built-In system volume:

1. Open the Sound control panel.
2. Choose Volumes from the pop-up menu.
3. Adjust the volume.

- Speech version 1.4.1 can cause a Macintosh Plus (a model which does not support speech) to hang during startup. If your Macintosh Plus hangs during startup, do the following:

1. Restart the computer while holding down the Space bar.
2. When the Extensions Manager dialog box appears, turn off Speech.

- If your computer has a 68000 processor and the computer won't start up, try pressing the Shift key (to turn off extensions) while you restart. If there is a "Color StyleWriter 2000 CMM" file in your Extensions folder (inside the System Folder), take this file out of the Extensions folder and restart your computer. (To use the Color StyleWriter 2000 series printer, you need a 68020 or higher processor.)

Tips

====

- Many LaserWriter LS users are unaware that this printer is supported by the LaserWriter 300 driver. To make this clear, future system releases will rename this driver to LaserWriter 300/LS. For now, you can either rename this driver or wait for a future release to do it for you. If you rename it, you must select the new name from the Chooser before you can print using this renamed driver.

- Recent-documents tracking (in Apple Menu Options) tracks all files that are opened—even those opened by an application as part of its launch sequence (such as drop-in filters used by desktop publishing packages). This tracking can significantly slow down the launching of these applications. To reduce this overhead you can:

- turn off "recent documents" tracking in the Apple Menu Options control panel
- turn off Apple Menu Options in the Extensions Manager

- This update resets all settings in the Apple Menu Options control panel to their default values. If you have made changes to Apple Menu Options, you will need to select them again after installing this update. If you have set Apple Menu Options to track more than ten items in any category, you may want to move

some of those aliases out of their folders before you install the update, which deletes all but the ten most recent items in each category.

MegaDial 1.0.1: Read Me (4/97)

=====

Article Created: 2 January 1996

TOPIC -----

This article contains the ReadMe included with Cypress Research's MegaDial telephony software available online.

DISCUSSION -----

MegaDial 1.0.1 Late Breaking News and Notes

First, thank you for using MegaDial. We hope that it makes your traveling and telecommunicating easier. This is a combined upgrade/30-day demonstration version of MegaDial. If you've already bought MegaDial, just install this version over your current version. If you haven't, you'll receive a thirty day full-featured demonstration of how MegaDial can make traveling with a laptop easier.

To buy a full version of MegaDial:

Call 1-800-515-8111 (+1 510 732 3830 outside the US and Canada) 6 AM to 6 PM PST Monday through Friday.

If you have any problems with MegaDial, please contact us at +1 408 752 2700, on the Internet at tech@cypressres.com, or on AppleLink at CYPRESS.

Usage Hints/Important Notes

- Installing MegaDial To install MegaDial, insert the installer disk in your floppy drive and double click on the file named "Install MegaDial". Choose the hard disk you wish to install on, then install. After you restart your machine, you need to configure MegaDial. Just open the MegaDial control panel and choose the location you've set up your software to dial with (Home or Office). You'll be stepped through a configuration process. If you're using MegaPhone, you can configure MegaDial from the Quick Prefs window.

- I Didn't Get 30 Days to Try MegaDial: If you install this version of MegaDial

over a demo version of MegaPhone, you may not receive an entire 30 days of trial for MegaDial. Call +1 408 752-1700, ask for technical support, and a support representative will give you a code to enable one more 30 day demo.

- **Getting Notified:** By default, MegaDial will present you with a dialing window every time you dial. You can change this by opening the MegaDial control panel, clicking on the expand arrow in the lower left hand corner of the window, and choosing another option from the "Ask me when dialing" popup.

- **Having Problems?** If you have problems using MegaDial with a particular program, you can turn it off temporarily. Just go to the MegaDial control panel, click on the "More" arrow to display the expert panel, and uncheck "Watch Modem". Remember to turn it on when you're done with that program. Please report any incompatibilities to us immediately!

- **Using Apple Remote Access:** MegaDial works with Apple Remote Access, including with Dial Assist, although MegaDial will do much more than Dial Assist.

- **Why Don't I See the Dialing Dialog?** Some programs, including many fax software packages, Apple Remote Access and some versions of Prodigy, dial at a time when it is unsafe to present interface. MegaDial detects all of these cases, and transforms numbers quietly, even if the notification options suggest that interface should be presented. The first time MegaDial transforms numbers quietly, it will notify you to check your settings if the call doesn't go through properly.

- **I Still Don't See the Dialing Dialog!** Depending on how you received this copy of MegaDial, it may be a version which is designed to work only with MegaPhone. If you received this in with MegaPhone, this is the case. To check if this is the case, expand the MegaDial control panel. If the "Watch Modem" checkbox is grayed out, MegaDial will work only with MegaPhone. Call 1-800-515-8111 to purchase MegaDial or to have a 30 day demo enabled.

- **Credit Card Calling Doesn't Quite Work:** In different locations, the amount of time you have to wait for an automated response to dialing a credit card access number can vary (from 2 to 20 seconds!). MegaDial is programmed with a good value for most locations: 10 seconds. If you need to lengthen this time, dial the phone by hand and count the number of seconds until you hear an automated response, and divide this number by 2. Click on the Expert button in the control panel, and change the number of commas in the "Before Calling Card" field to match this number. Some modems support a special character which means "wait for credit card tone." Check your modem manual for more information, and type this instead, however, note that this character won't always work. In the United States, if you are using a carrier such as Sprint 800 or ATT 800, the pause before the phone number dialed is stored in the actual carrier entry, so you'll have to choose "Edit Carrier..." from the Long Distance popup menu in the control panel, and edit the actual carrier (use the same technique as above to determine how many commas to enter). The "After Calling Card" field is used by carriers like the MCI 800 numbers, and is placed after the calling card account and PIN and before the phone number dialed. See your manual for more information.

Known Issues

-Some fax software and other communications packages dial at a time when it is unsafe to check for dialing prefixes, carriers, and suffixes in the dialed number. For best results, be sure the phone numbers you've entered in the software packages don't include any prefixes, non-default carriers, or suffixes.

-If you use TCP/IP connections for America OnLine and use demand-based PPP or SLIP dialing software such as MacPPP, you should dial your provider to make the TCP/IP connection before attempting to connect to AOL, or MegaDial will choose an improper telephone number for your connection.

-MegaDial 1.0.1 will not intercept fax calls made by FaxPro 2.2.2.

DISCUSSION -----

MegaPhone 1.0.2 Late Breaking News and Notes

First, thank you for using MegaPhone. We hope that it will make your time on the telephone more productive and enjoyable.

Please be sure to read the manual and the information below for useful tips on using MegaPhone. If you have any problems with MegaPhone itself, please contact technical support at +1 (408) 752-2700, on the Internet at tech@cypressres.com, or on AppleLink at CYPRESS. If you are having problems with your GeoPort Telecom Adapter or Apple software, please contact the Apple Assistance Center directly.

Major changes and fixes in this version

- Error -93 when sending to PowerTalk on machine with no network: Users not on a network that attempted to deposit voice messages into the PowerTalk In Tray would receive an error. This is fixed.
- Occasional corruption of contacts file: A contact in the contacts file would occasionally become corrupt causing problems for the entire file. This is fixed.
- Speed dial list was occasionally reset: Under some circumstances (especially if MegaDial was running from a disk other than the disk containing the system folder) the speed dial information was not saved correctly. This is fixed.
- Entering 1 multiple times quickly while retrieving a voice message sometimes caused a crash: While retrieving messages remotely, users could sometimes cause

their Macintosh to crash by entering 1 to delete a message multiple times in quick succession. This is fixed.

- New, Edit, and Delete buttons on Contacts window: Buttons for creating, editing, and deleting contacts have been added to the top of the Contacts window. This is in response to user requests for these buttons.
- Other minor interface problems corrected: Various redraw and update problems under rare conditions have been corrected.

We continue to improve MegaPhone, so if you find problems or have suggestions, please pass them along to us by calling us or sending electronic mail.

Usage Hints/Important Notes

- Installing MegaPhone: To install, double click on the file named "Installer". Choose the hard disk you wish to install on, then install. After you restart your machine, you can launch MegaPhone. Version 1.0.2 of MegaPhone is designed to work with Telephone Manager Version 2.0 or later from Apple Computer. This version of the Telephone Manager is installed by your Apple Telecom Software Installer. Before launching MegaPhone, please ensure that you have already installed this software from Apple Computer, Inc.

- If you are installing over a previous version of MegaPhone, you should not lose your preferences, contacts, voice messages, outgoing greeting, your call log, or your scheduled calls.

- Using MegaDial: MegaPhone works in conjunction with MegaDial to format your phone numbers in a canonical format so that they can be dialed properly from anywhere in the world. It also uses MegaDial to figure out the local time at any number you are calling and to look up area, country, and city codes. However, you must configure MegaDial for all these features to work. You can configure MegaDial by clicking the "Configure MegaDial" button in "Quick Prefs", by clicking the "Location" button in the main window of MegaPhone, or by selecting the MegaDial control panel in the Control Panels folder. MegaDial can also help you dial from your telecommunications and fax applications. For more information on MegaDial, you can call Cypress Research at +1 (408) 752-2700.

- If people you talk to are complaining of an echo, you should experiment with the placement of your microphone relative to your speakers. Because the GeoPort Telecom Adapter and some other devices MegaPhone uses provide a full duplex speaker phone, your microphone is not "cut out" while the other party is speaking. This means that they will hear themselves talking in a way that they are not used to on a telephone conversation. If you move your microphone farther from your speakers, this can greatly reduce this effect. Additionally, you can place your microphone behind the plane of your speakers so that the sound will not be directed at the microphone. This effect will be enhanced if you are in a room that does not absorb sound well. It may take some experimenting to optimally position your microphone and speakers, but you should be able to reduce this effect to an acceptable level.

- If you use RAM Doubler or Virtual Memory, you may experience a buzzing or breaking up of your phone conversations. Usually, this is only on your end of the conversation; the party you are talking to will not hear this. If you do

experience this, you should quit all other applications so more time can be given to process the sounds for your phone conversation. At this point, there is no other fix for this problem.

- To set incoming call options such as the ring sound, the number of rings after which your phone should be answered with voice messaging, call saver mode, etc. you must open the Express Modem control panel. See the Express Modem documentation for details.

- The call saver mode sets the number of rings after which your phone will be answered if there are new messages. For example, if your phone is normally answered after 4 rings, but you have the call saver mode set to 2 rings, MegaPhone will answer your phone after 4 rings for the first caller to leave a message and after 2 rings for all callers after that. More importantly, if you call in to retrieve your messages and you reach the 3rd ring, you know no one has left a message yet and can hang up, saving yourself a call charge.

- If you have Fax Terminal set to "Auto-Answer" incoming calls, there may be a brief delay when you answer a call manually with MegaPhone (e.g., by clicking the "Answer" button) while the Express Modem software listens for fax or modem tones. If it detects these tones, the call will be handled by the appropriate fax or data software, otherwise, you will be allowed to take the call. During this time, you will not be able to talk to the calling party. The time period is brief enough that the calling party will most likely not notice the delay. When you are able to talk to the calling party, MegaPhone will emit a brief chirping sound to alert you to begin talking. In fact, for all incoming calls (whether or not you have Fax Terminal set to "Auto-Answer") MegaPhone will emit the brief chirping sound when you can talk to the calling party. This is useful when you have MegaPhone in the background and have answered the call with the Telephone System Menu.

- If you have more than 400 contacts, we recommend that you not store them all in the MegaPhone contacts window and that you not auto-synchronize with your source for these contacts. Instead, you should only store your most active contacts in the MegaPhone contacts window so that you can use Speed Dial, call counting, etc. You should dial from your PIM for less frequently called numbers. If you use TouchBase Pro, you can dial using the "Dial Phone Number" menu item in the "Contacts" menu. Even if this contact is not in the MegaPhone contacts window, MegaPhone will still display the name in the main window while you are talking and will enter it in the call log. To configure this option in TouchBase Pro, ensure MegaPhone is launched, select "Dialing..." from the "Preferences" hierarchical menu in the "Edit" menu, select "⌘ Dialing" under "Use:", click OK, select the MegaPhone running on your Macintosh from the selection dialog that is presented, click OK. You are now configured to have TouchBase Pro use MegaPhone for dialing. If you decide to have more than 400 contacts in MegaPhone, we recommend that you increase the preferred memory requirement to at least 2MB.

- Before importing any contacts, be sure you have configured MegaDial. If you configure MegaDial after you import your contacts, each time you call a contact MegaPhone will treat it as an unknown contact because the number will not have been put in canonical format when you imported it.

- The call log is limited to 250 entries. After the call log has 250 entries, the next entry will replace the oldest entry in the log. If you would like to save your call log entries, open the call log window, and select "Export..." from the "File" menu to export the entries to a tab delimited text file.
- The number of voice messages is limited to 99. If you do not direct your messages to your PowerTalk In Tray, MegaPhone will stop taking messages once you have 99 messages. Given that messages can take up a lot of hard drive space, it is a good idea to delete messages you no longer need. If you want to save messages for a long time, we recommend that you drag them out of the voice messages folder and save them in another folder. You can always rename the file after you have dragged it out of the voice messages folder and can hear the message by double clicking on the file. You can locate your voice messages folder by opening the "Voice Messaging" panel of "Preferences" and looking at the path specified in the "Messages Folder" section.
- When using an AV monitor, on some Macintosh models, the sound control panel resets the sound input source to external microphone with "Playthrough" not checked and the alert volume to maximum. What you want in this case is for the sound input source to remain "AV Connector" with "Playthrough" checked and for the volume to remain where you left it. The best fix for this problem is to use and external microphone so the default setting will be correct. In general, to change the sound input source, open the Sound control panel, select the "Sound In" page from the popup menu, click the "Options" button and select the source you wish.
- If you record a voice messaging greeting and it appears to record but is silent, you may have your CD player selected as your sound input source. Before recording a greeting, open the Sound control panel, select "Sound In" from the popup menu, click the "Options..." button, then select "Microphone", "AV Connector", or another appropriate choice depending on your hardware configuration. Do not check the "Playthrough" checkbox. Be sure to set the source back to CD, if you want to listen to audio CDs on your Macintosh. If you receive or place a call while you are listening to a CD, the sound input will temporarily be switched to your phone so that you can converse with the other party. After the call, it will be switched back automatically. However, for recording your greeting, you must switch the source yourself.
- The DemoDialer Tool is a telephone tool that MegaPhone installs if it cannot use the tool you have selected as your default tool. For this version of MegaPhone, the default is the GeoPort Telephone Tool. The DemoDialer tool allows you to dial numbers by emitting the Touch Tone sounds through the Macintosh speaker and gives you access to various other features of MegaPhone. However, you cannot receive incoming calls or take voice messages with this tool because it does not provide any connection to a phone line. If MegaPhone indicates that it has switched to using this tool because an error has occurred, you may quit MegaPhone, fix the error condition, and re-start MegaPhone; it should then resume using the GeoPort Telephone Tool. If you need to manually change which tool is your default tool, you can do so in the General panel of Preferences.
- If you forget to purchase the full featured version of MegaPhone before the 30 trial period has expired, you can still call Cypress Research and purchase this

option. Once you do so, all data you entered into contacts, call log, etc. will still be available to you. It is not deleted.

- For information on site-licensing MegaPhone, please contact Cypress Research at +1 (408) 752-2700.

To purchase the full featured version of MegaPhone or MegaDial:
Call 1-800-515-8111 [+1 (510) 732-3830 outside the US and Canada].

System 7.5 Update 2.0: Overview and Installation Read Me (6/96)

Revised: 10/14/96
Security: Everyone

System 7.5 Update 2.0: Overview and Installation Read Me (6/96)

Article Created: 2 January 1996
Article Reviewed/Updated: 10 June 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

What is the Macintosh System 7.5 Update 2.0?

System 7.5 Update 2.0 is a set of system software enhancements that improves the reliability and performance of all computers running system software version 7.5, 7.5.1, or 7.5.2. You can install System 7.5 Update 2.0 even if you did not install Macintosh System 7.5 Update 1.0.

Before you install System 7.5 Update 2.0, review the next section, "What System 7.5 Update 2.0 Provides," which summarizes the fixes and new features delivered by this update. For a more detailed explanation of the changes in this release, see the three Read Me files named "New in This Update." (If you received the update on a CD or over a network, these Read Me files are in the same folder as this Read Me file. If you received this update only on floppy disks, the files are in the System Update Information folder on the first floppy disk.)

What System 7.5 Update 2.0 provides

- Installs the latest versions of all components (including any components that you disabled using the Extensions Manager) it finds on the disk it is updating.

After you run the Installer, updated components will be in the same folders as they were before you installed the update. For example, new versions of disabled extensions will be in the "Extensions (Disabled)" folder, and new versions of disabled control panels will be in the "Control Panels (Disabled)" folder.

- Fixes many problems that users and developers reported to the Apple Assistance Center, Developer Technical Support, and Apple's internal tracking systems.

Among these fixes are elimination of some Type 11 errors found on PowerPC-based computers, and corrections to the General Controls panel to eliminate conflicts with several third-party products.

- Improves performance by including an updated version of the Finder, which copies files faster than previous versions. Performance on PowerPC-based computers also improves because the update introduces several more native system software components, including Apple Guide, the Resource Manager, and the SCSI Manager.

- Introduces "translucent dragging" on PowerPC computers.

- Includes version 1.0.4 of Drive Setup, for use on IDE-capable, 68K-based computers and all PowerPC-based computers. The new version of Drive Setup fixes a problem with some IDE drives. If you use IDE (ATA) drives, you should update your drivers as part of the installation of this update. (If you have an IDE drive, see the section "Known Problems and Their Workarounds" at the end of the "New in This Update - 3" document for more information about Drive Setup.)

- In addition to updating system software for a single Mac OS computer, you can use this update to create a "universal" System Folder—a single System Folder that can be used with all Mac OS computers supported by the update. You can use this universal System Folder on an external hard disk or removable media drive to start up any model of Mac OS-based computer. For more information, including special installation instructions, see the section "Creating a 'Universal' System Folder," at the end of this document.

- On computers with 68030, 68040, or PowerPC processors, the update's Easy Install automatically installs Open Transport networking software, which provides improved network flexibility and performance. After you install the update, Open Transport will be active only if it was active before the update was installed. Open Transport is available on all computers with 68030, 68040, or PowerPC processors except for the desktop 5200, 5300, 6200, and 6300 series computers. On some computers, you can use the Network Software Selector (in the Apple Extras folder after you install the update) to switch between Open Transport and classic AppleTalk. Open Transport may require more RAM than classic AppleTalk. For more information, see the Open Transport Information folder, inside the Apple Extras folder.

- During an Easy Install, Text-to-Speech software is automatically installed. If you don't use this software, after you install the update you can use the Extensions Manager to turn off MacinTalk (version 2 or 3) and the Speech control panel.

- After you install the update, the About This Macintosh window says "System Software 7.5.3"; below that, the window says "System 7.5 Update 2.0," to indicate how the system software was installed.

- Includes many other previously released fixes, including those in the 7.5.2 Printing Update, the PowerBook 5300 System Software Update, and the PowerBook

2300c Update.

For more details on what has been fixed in this update, see the three Read Me files named "New in This Update."

Installing System 7.5 Update 2.0

=====

You can install the update from floppy disks, the CD, over a network, or from your hard disk. Install the update before you install other software included with the update (such as PowerTalk, QuickDraw GX, and so on).

Note: If your computer has a PowerPC Upgrade Card installed, make sure that the PowerPC processor is turned on when you install this update.

Note: If you are going to install Apple Remote Access Client 2.0.1 software (not included with the System 7.5 Update 2.0), install it before you install this update.

Installing System 7.5 Update 2.0 from the CD or from floppy disks

=====

Before you install System 7.5 Update 2.0, make sure that system software version 7.5, 7.5.1, or 7.5.2 is installed on your computer. (You can check by opening the Apple menu from the Finder and choosing About This Macintosh.)

You should use the Disk First Aid program (included with this update) to test and, if necessary, repair the disk on which you're going to install the update. For instructions on using Disk First Aid, see the manual that came with your computer.

To install the System 7.5 Update 2.0 from the CD or floppy disks, follow these steps:

1. Open the Extensions Manager control panel.
2. If your current system software is 7.5 or 7.5.1, choose "System 7.5 only" from the pop-up menu. If your current system software is 7.5.2, choose "System 7.5.2" from the pop-up menu.
3. If you have third-party peripherals that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, alternative input devices, network card drivers, and removable media.)
4. Restart your computer.
5. Insert the System 7.5 Update 2.0 CD or the first floppy disk.
6. Double-click the Installer icon to open it.
7. When you see the Installer's welcome screen, click Continue.

The Easy Install dialog box appears.

These instructions cover the Easy Install process. Easy Install automatically installs the files that your particular model of computer needs.

If you want to add specific components after using Easy Install, choose Custom Install from the pop-up menu at the top of the Easy Install dialog box, and see the instructions in the manual that came with your computer or system software upgrade.

8. Make sure that the destination disk indicated on the screen is the one on which you want to install the update. If it is not, click Switch Disk until the right destination disk appears.

9. Click Install.

10. Follow the instructions on the screen.

If you need to insert other floppy disks, onscreen messages tell you when to do so. It takes several minutes to complete the installation.

11. When the installation is complete, click Restart to restart your computer.

12. Use the Extensions Manager to turn on additional extensions (you'll need to restart your computer for the extensions to work). If you encounter problems, choose the set of extensions you chose before the installation (see step 2), restart your computer, then turn on extensions one at a time to determine if one of them is incompatible.

Installing System 7.5 Update 2.0 over a network or from a hard disk

=====

To update multiple computers over a network, you can create a "net install package," which makes updating networked computers faster and simpler. You can also put a net install package on your hard disk, and use the package to install the update on the same hard disk.

If you already have a net install package available, skip to "Step 2: Install the Update."

Step 1: Create a net install package for Update 2.0

To create a net install package from a CD, drag the entire System 7.5 Update 2.0 folder from the Update 2.0 CD to the server computer.

To create a net install package from the network, download the 7.5 Update 2.0 Net Install package to your hard disk.

To create a net install package from floppy disks, follow these steps:

1. Create a folder on the server called "System 7.5 Update Net Install."

2. Insert the first floppy disk.

3. Open the disk and drag the following items into the System 7.5 Update Net Install folder:

- the Installer
- the Install System 7.5 Update file

4. Close the disk and drag the disk's icon itself into the System 7.5 Update Net Install folder.

At this point, your System 7.5 Update Net Install folder should contain three items:

- a copy of the Installer
- a copy of the Install System 7.5 Update file
- a folder named "System 7.5 Update 2.0 - 1" that contains everything that was on the first floppy disk.

5. When the copy is complete, eject the disk (by dragging its icon to the Trash).

6. Do the following for each of the remaining installation disks:

- Insert the disk in the floppy disk drive.
- Drag the disk icon to the System 7.5 Update Net Install folder.
- Eject the disk when the copy is complete.

Note that all but the first two items (Installer and Install System Update) in your System 7.5 Update Net Install folder are folders that contain the contents of each corresponding disk.

IMPORTANT: Don't move or rename any file or folder inside the System 7.5 Update Net Install folder. If you do, the Installer won't work.

Step 2: Install the update

Before you install System 7.5 Update 2.0, make sure that system software version 7.5, 7.5.1, or 7.5.2 is installed on your computer. (You can check by opening the Apple menu from the Finder and choosing About This Macintosh.)

You should use the Disk First Aid program (included with this update) to test and, if necessary, repair the disk on which you're going to install the update. For instructions on using Disk First Aid, see the manual that came with your computer.

To use a net install package, follow the instructions below:

=====

1. Open the Extensions Manager control panel.

2. If your current system software is 7.5 or 7.5.1, choose "System 7.5 only" from the pop-up menu. If your current system software is 7.5.2, choose "System 7.5.2" from the pop-up menu.

3. If you have third-party peripherals that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, alternative input devices, network card drivers, and removable media.)

4. Restart your computer.

5. If necessary, connect to the server that contains the System 7.5 Update Net Install folder.

6. Open the System 7.5 Update Net Install folder.

7. Double-click the Installer icon to open it.

8. Read the first screen, then click Continue.

9. The Easy Install dialog box appears.

- To automatically install just the software your model of computer needs, click Install.

- To select specific items to install, see the instructions for custom installation in the manual that came with your computer.

10. When you see a message that the installation was successful, click Restart.

11. Use the Extensions Manager to turn on additional extensions (you'll need to restart your computer for the extensions to work). If you encounter problems, choose the set of extensions you chose before the installation (see step 2), restart your computer, then turn on extensions one at a time to determine if one of them is incompatible.

Creating a "universal" System Folder

=====

This section describes how to create a single System Folder that can start up any Mac OS computer introduced since the Macintosh Plus.

Overview

Only some users need a universal System Folder. You might want to create a universal System Folder if you

- start up different Macintosh models using removable media
- want to simplify support of multiple users by giving all users the same System Folder
- prefer to start up computers using an external startup disk

If you are responsible for only one computer, you shouldn't need to create a universal System Folder.

Requirements

To create a universal System Folder, you must start with System 7.5. The procedure will not work if you start with System 7.5.1 or 7.5.2. (You cannot install System 7.5 on a computer that requires 7.5.2 or greater.)

These steps assume you're not installing the software on your startup drive. A universal System Folder can be created on your startup drive, but you'll be forced to restart after each installation. By installing onto another drive, you

can avoid several restarts.

Instructions

1. Open the System 7.5 Installer (the Installer for version 7.5.0 of the system software).

2. When you see the Installer's welcome screen, click Continue.

3. Choose Custom Install from the pop-up menu in the upper-left corner of the dialog box.

4. Click Switch Disk until the name of the desired destination disk appears.

5. Click the triangle on the left side of the first item in the list.

6. Click the box next to "System for any Macintosh" to put an "X" in it.

7. In the list, click the triangle to the left of Utility Software, then click the box next to AppleScript to put an "X" in it.

If you are creating the universal System Folder on a disk that did not already have a System Folder on it, skip step 8.

8. If you are creating the universal System Folder on a disk with a System Folder on it, hold down the Command and Shift keys while pressing the K key. Click to select the button labeled Install New System Folder and then click OK.

9. Click Clean Install (or Install, if you skipped step 8) and wait for the installation to finish (inserting disks as needed).

If the destination disk had a System Folder on it, the contents of your old System Folder have been moved to a new folder titled Previous System Folder.

10. Insert the System 7.5 Update 2.0 CD or the first update floppy, disk and open the System 7.5 Update Installer.

11. When you see the Installer's welcome screen, click Continue.

12. Choose Custom Install from the pop-up menu in the upper-left corner of the dialog box.

13. Click Switch Disk until the name of the desired destination disk appears.

14. Click the Universal System Folder box to put an "X" in it.

If you don't see this option, make sure that you've done the previous steps correctly.

15. Click the Install button and wait for the installation to finish (inserting disks as needed).

Apple MessagePad: Modem Enabler 1.0: Read Me (1/96)

Revised: 1/29/96
Security: Everyone

Apple MessagePad: Modem Enabler 1.0: Read Me (1/96)

=====

Article Created: 03 January 1996
Article Reviewed/Updated: 29 January 1996

TOPIC -----

This article contains the Read Me from the Modem Enabler 1.0, which is currently posted to Apple SoftWare Updates.

DISCUSSION -----

You need ModemEnabler 1.0 and a modem setup package in order to use a non-Apple modem with your MessagePad. ModemEnabler 1.0 and several modem setup packages are available in this folder. ModemEnabler 1.0 allows you to change modem settings on your MessagePad. A modem setup is a package that enables a MessagePad to configure and operate non-Apple modems. Each modem has its own modem setup package, which is typically provided by the modem manufacturer.

This Read Me document explains what you need to do before installing ModemEnabler 1.0 and modem setup packages, what to do to install them, and how to work with them after they are installed.

NOTE: ModemEnabler 1.0 is not recommended for use with the MessagePad 100 or the original MessagePad as modem and application compatability may vary.

BEFORE YOU INSTALL THE MODEM SOFTWARE

- Make sure you have the Newton Connection Kit.
- You must have 55K of available internal memory. (ModemEnabler 1.0 takes up 38K of internal memory storage once it's installed.)
- If you have a MessagePad 110, you must have the latest system software installed on your MessagePad--Newton System Update 1.3 (345025)--in order for modem setup packages to work properly. To check to see if your MessagePad has the correct version of software, tap Extras to open the Extras Drawer, then tap

Prefs. The system software version number is at the bottom of the screen.

INSTALLING MODEM ENABLER 1.0

WARNING: To properly install ModemEnabler 1.0, you must unlock the storage card lock switch on your MessagePad. (Slide the locking tab to the unlocked position so that a red strip is visible.) For more information, see the handbook that came with your MessagePad.

Install ModemEnabler 1.0 using the Newton Connection Kit. You can then move the storage card locking tab to the locked position.

INSTALLING MODEM SETUPS

WARNING: To properly install modem setup packages, you must unlock the storage card lock switch on your MessagePad. (Slide the locking tab to the unlocked position so that a red strip is visible.) For more information, see the handbook that came with your MessagePad.

Install one or more modem setups using the Newton Connection Kit. You can then move the storage card locking tab to the locked position.

There are four packages in the Modem Setup folder, two for the Motorola CELlect modem card and two for Hayes modems. The packages are described below.

- MotoCELlect Cellular--For use with the Motorola CELlect PCMCIA and Motorola CELlect pocket modems connected to any data-capable Motorola MC2 Microtac cellular phone.
- MotoCELlect 14.4--For use with the Motorola CELlect PCMCIA and Motorola CELlect pocket modems connected to standard telephone lines.
- Hayes Error-Correcting--For use with modems (including Hayes brand modems) that implement the complete Hayes command set.
- Hayes Compatible--For use with the majority of other modems that implement the basic Hayes commands but use a different set of commands for configuring features, such as error correction and flow control.

USING MODEM ENABLER 1.0 AND MODEM SETUPS

Once ModemEnabler 1.0 and one or more modem setup packages are installed, you can

- select modem setups that are right for your modem
- remove modem setups when you no longer need them

To select a modem setup, follow these steps:

1. Tap Extras to open the Extras Drawer, then tap Prefs.
2. Tap Modem.
3. Tap "Connect with." A list of modem setups installed on your MessagePad

appears.

4. Tap your choice in the list.

To remove a modem setup, follow these steps:

1. Tap Extras to open the Extras Drawer, then tap Prefs.

2. Tap Modem.

3. Tap Remove Modem Setup. A list of modem setups installed on your MessagePad appears.

4. Tap the modem setup you want to remove from the list.

A message appears telling you the selected modem setup was removed.

You can also remove ModemEnabler 1.0 at any time. Refer to the handbook that came with your MessagePad for information on removing software.

NOTE: If you remove ModemEnabler 1.0 from your MessagePad, you will not remove any modem setup packages.

MODEM COMPATABILITY ISSUES WITH MESSAGEPAD SOFTWARE

Modem compatabilty with internal MessagePad software will vary between modem vendors. The following software have known compatability issues with some third-party modems:

- Call slip on MessagePad 110 may not operate with some modems.
- Built-in Fax application requires modems to support Class One fax protocol.

COMPATABILITY ISSUES WITH SOFTWARE FROM OTHER SOFTWARE VENDORS

Apple Computer, Inc. tries to ensure that application programs from other software vendors are compatible with our software. However, the following products have compatability issues with ModemEnabler 1.0:

Notify! Newton

- When using the MotoCELLect Cellular setup on a MessagePad 110, The "Modem Setup" string should be set to "&F1e0s12=12&c1\q1\x0\n7" for most TAP servers.
- When using the MotoCELLect 14.4 setup on a MessagePad 110, The "Modem Setup" string should be set to "&Fe0s12=12&c1\q1\x0\n7" for most TAPservers.

Power Macintosh: PCI Card Power Requirements (6/96)

Revised: 6/6/96
Security: Everyone

Power Macintosh: PCI Card Power Requirements (6/96)

=====

Article Created: 3 January 1996
Article Reviewed/Updated: 3 June 1996

TOPIC -----

I am adding PCI cards to my Power Macintosh computer and would like to know how many I can add and what the power requirements are for the PCI slots.

DISCUSSION -----

The Power Macintosh 7200, 7500 and 8500 computers have three expansion slots, which use the industry standard Peripheral Component Interface (PCI) bus. These computers provide a total of 50 watts of power for the three expansion slots. Both 5 volts and 3.3 V are supplied; the total power at both voltages must not exceed the 50 W maximum.

The Power Macintosh 9500 has six PCI slots supported by two Bandit custom ICs: one for PCI slots 1-3 and the other for PCI slots 4-6. The computer provides a total of 90 W of power for the six expansion slots. Both 5 V and 3.3 V are supplied; the total power at both voltages must not exceed the 90-W maximum.

The Power Macintosh 7200, 7500, 8500 and 9500 computers accept standard PCI cards as defined by the PCI Local Bus Specification, Revision 2.0. The cards are required to use the 5 V signaling standard and to use the standard ISA fence described in this specification.

Power Macintosh 7200: Simultaneous Sound Output (1/96)

Revised: 1/30/96
Security: Everyone

Power Macintosh 7200: Simultaneous Sound Output (1/96)

Article Created: 3 January 1996
Article Reviewed/Updated: 30 January 1996

TOPIC -----

I have a Power Macintosh 7200 series computer which is connected to a monitor with built-in speakers. I would like to play audio through the computer's internal speakers while playing audio through my monitor's speakers. I think I have everything set up properly in the Sound control panel, but each time I restart the computer, sound is no longer played through the computer's internal speaker. I only get sound out of the monitor's speakers. What is the proper way to set this up so that the settings will remain?

DISCUSSION -----

To have sound output through both the internal speakers of the Power Macintosh 7200 and the monitor's speakers, follow these steps:

Step 1

Connect an audio cable from the sound output port on the computer to the sound input port on the monitor.

Step 2

Select Volumes from the pop-up menu in the Sound control panel.

Step 3

Deselect (uncheck) both the "Built-in" and "Built-in Headphones" Mute checkboxes.

Step 4

Follow steps 2-3 each time you restart the computer.

When speakers or headphones are plugged into the sound output port on a Power Macintosh 7200 series computer, the computer mutes the built-in speaker by default during startup. This is normal for the Sound control panel to behave in this manner, and the only workaround is to change the settings after restarting the computer.

Macintosh Performa: Available Power Macintosh Upgrades (4/97)

Revised: 4/8/97
Security: Everyone

Macintosh Performa: Available Power Macintosh Upgrades (4/97)

Article Created: 6 January 1995
Article Reviewed/Updated: 8 April 1997

TOPIC -----

I have a Macintosh Performa computer, and I want to upgrade my computer to the PowerPC processor. What are my options?

DISCUSSION -----

Overview

There are two possible ways to upgrade Macintosh Performa computers:

- Add a Macintosh Processor Upgrade card (part M3397LL/A, discontinued), which includes a PowerPC 601 chip. This option applies to the Macintosh Performa and Quadra 630 series and the Macintosh Performa and LC 575, 577, and 578 computers.
- Install the Power Macintosh 5300/6300 Logic Board Upgrade (M4447LL/A), which includes a PowerPC 603e chip. This option applies to the Macintosh Quadra and Performa 630 series and the Macintosh 5200CD and 6200CD series computers.

Both upgrades must be performed by qualified Apple-authorized service providers. Service providers can also provide specific availability and pricing information.

Macintosh Processor Upgrade

The Macintosh Processor Upgrade (discontinued) involves removing the existing Motorola 68040 microprocessor (which is socketed) and replacing it with a card that lays flat over the logic board. Once installed, the 68040 is inserted in the card. The card covers the LC-compatible processor-direct slot, so additional expansion cards cannot be used. However, it leaves the communications slot available, and you will have access to your RAM sockets.

The main advantage of this upgrade is that it provides access to PowerPC technology, while still retaining the functionality of the Motorola 68040 chip that originally came with the computer. It is a low-cost solution that should appeal to people who have a large investment in conventional software, who do not plan on upgrading all of their software immediately, or who are using "mission-critical" software that requires the 68040 chip.

Its disadvantage is that, like all upgrade cards, it is not a fully integrated solution because it still retains the original logic board. So its performance will likely not be as fast as a logic board replacement.

Power Macintosh 5300/6300 Logic Board Upgrade

The Power Macintosh 5300/6300 Logic Board Upgrade (part M4447LL/A) replaces the entire logic board of the computer and replaces it with the logic board of the Power Macintosh and Performa 5300/6300 series computer. This logic board includes a PowerPC 603e chip with a 100 MHz clock speed. It has two SIMM sockets, in which you can install memory. It increases the total memory capacity of the computer to 64 MB of RAM. It also supports 16-bit sound input (at 22 KHz) and output. Note that this upgrade does not include RAM so you must retain any memory that you had installed in your computer originally or purchase additional memory separately.

Besides the additional system features, you will also experience better performance than with the Macintosh Processor Upgrade. By not utilizing an upgrade card, you can continue to use the LC-compatible processor-direct slot.

Notes:

The following computers are in the Macintosh 630CD family: LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, and Performa 638.

The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

The following computers are in the Macintosh 6200CD family: Performa 6200, 6214, 6216, 6218, 6220, and 6230.

Article Change History:

08 Apr 1997 - Updated with availability information.
06 Jun 1996 - Clarified memory section for 5300 upgrade.
18 Jan 1996 - Corrected upgrade part number.

Apple Internet Connection Kit 1.0 Read Me (5/96)

=====

Article Created: 3 January 1996
Article Reviewed/Updated: 24 May 1996

TOPIC -----

This article is the Apple Internet Connection Kit 1.0 (AICK) ReadMe file.

DISCUSSION -----

Read Me
=====

Before you install the Apple Internet Connection Kit, read the following information.

Getting Help Installing and Using Your Internet Connection Kit

Apple will assist you with the installation and setup of the Apple Internet Connection Kit. Our specially trained telephone support staff can assist you with information on:

- Installation
- Registration
- Configuration

Once you have selected an Internet Service Provider, and registered with them, they will be able to assist you with:

- Basic Product Use
- Applications Questions or Issues
- Billing Issues
- Connection questions and problems

If you are accessing the Internet over a LAN, contact your Network Administrator for help in setup and use.

..TIL19144-Apple_Internet_Connection_Kit_1-0_Read_Me_5-96_(TA34914).pdf

Telephone support is available Monday through Friday (excluding Holidays) from 6 A.M. to 6 P.M. Pacific Standard Time. In Canada*, hours are 8 A.M. to 8 P.M. Eastern Standard Time. If you need support with getting started with your kit, call us at 1-800-SOS-APPL (1-800-767-2775). In Canada, call 1-800-263-3394.

Apple provides an excellent on-line reference source for technical information: The Apple Tech Info Library. You can search through thousands of articles on Apple products, past and present, updated regularly by Apple Support personnel. The Apple Technical Information Library (TIL) is available on the Internet (<http://www.info.apple.com/til.html>), AppleLink (Support -> Tech Info Library), and CompuServe (GO APLTIL).

System Requirements

- Power Macintosh or Macintosh computer with 68030 or greater CPU
- Mac OS 7.5 or greater
- 8 MB RAM
- 17 MB hard disk space

Open Transport Users

Open Transport v1.0.6 ships as a built-in component of Mac OS system software (System Software 7.5.2 with System Enabler 1.1) on the Power Macintosh 7200, 7500, and 8500 models. Software on newly manufactured Power Macintosh 9500 systems is updated as well. The Apple Internet Connection Kit requires Open Transport 1.0.7 or later. You must upgrade your networking software before installing the Apple Internet Connection Kit.

If you have a Power Macintosh 9500 without this update, you will need to contact the Apple Order Center to obtain the System 7.5.2 Version 2 CD-ROM disc for Power Macintosh 9500. This CD-ROM disc includes System Enabler 1.1 and Open Transport 1.0.6. This update is strongly recommended for all Power Macintosh 9500 customers.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

The "For PCI based Macs" folder on the Apple Internet Connection Kit CD includes a patcher to upgrade Open Transport 1.0.6 to 1.0.7.

Additional information about Open Transport can be retrieved via the Internet from <ftp://seeding.apple.com/ess/public/opentransport/>

Installation Instructions

To install the Apple Internet Connection Kit on your hard drive, double-click on the Installer file and then follow the instructions on your screen. Click on the Apple Internet Dialer icon from the Internet Kit window in the Launcher. Should you not desire to use the Launcher interface for accessing the applications in the kit, open the General Controls control panel, and click "off" the "Show Launcher at startup time".

Installation on an External drive with a System Folder

If you install the Internet Connection Kit on an external drive that has a System Folder on it, the System Preferences, and startup files will be installed in the external System Folder, leaving the startup volume untouched.

ISP Registration Requires You to Write Down Important Information

You will be asked to write down your username and password after registering with an Internet Service Provider. You can easily retain this information on your computer by:

- 1) Command-shift-3 will do a screen shot of what is on your monitor screen, will then be saved on your hard drive with the name "Picture 1", and can be opened with any application such as SimpleText.
- 2) You can select the text, and copy it into your Scrapbook.
- 3) Write the information down on a piece of paper.

If you forget to write it down, you will need to contact your ISP to get that information, should you need it. Apple will not be able to assist you with recapturing this information.

Connecting to a News Server for the First Time

Connecting to a news server for the first time can take from one minute to more than 30 to download the newsgroups, depending on your ISP's configuration. Your ISP provides you access to a news server, and depending on the number of newsgroups supported, the initial connection could be quite lengthy. Subsequent connections are likely to be much quicker.

Backup Your ISP Information

Once you have successfully registered with an ISP, it is recommended that you backup the preferences and settings in case you need to restore them. You can do this by launching the Dialer, and selecting "Backup ISP Information..." from the File menu.

SLIP

The Apple Internet Dialer is configured to use MacPPP, it will not work with InterSLIP. If you need to use SLIP, contact your ISP for instructions as how to manually configure and setup your system using the SLIP software.

Low on RAM?

If you are attempting to run several internet applications simultaneously, and are getting "Not Enough Memory to Run ..." you can either:

- Turn on Virtual Memory (VM) by opening the Memory control panel, and clicking on the radio button which activates VM.
NOTE: For best performance, never set VM to more than twice the amount of physical RAM (if you have an 8 MB system, VM should be no more than 16 MB).
- Decrease the number of Extensions in your System Folder.

- Purchase more RAM.

MacPPP Version

Apple Internet Connection Kit requires version 2.1.4 of MacPPP. If you previously had a different version of MacPPP installed on your machine, you should replace it with the version provided in your package. There is a version available on the Internet called MacPPP v 2.2 that is not compatible with the Internet Connection Kit, and should not be used with this product.

Restoring Your LAN Configuration

If you inadvertently installed the Dialup configuration over your existing Internet LAN configuration, you can restore your settings by doing the following:

- 1) Open the Internet Connection Kit folder.
- 2) Open the folder called "Backup Folder".
- 3) Open your System Folder along side of the Backup Folder.
- 4) Replace all items in your System Folder with those of the same names in the Backup Folder.
- 5) Reboot your machine.

QuickTime Conferencing

If you install QuickTime Conferencing after installing your Internet Connection Kit, a file called SNMP TCP/IP Transport will be installed in the Extensions folder. It is incompatible with MacPPP, and can cause your system to freeze at restart. If you encounter any problems, hold down the Shift key upon restart, and remove SNMP TCP/IP Transport from your System Folder. Contact your Network Administrator to see if you need this file.

What is Installed in Your System Folder?

After doing an Easy Install, Apple Internet Connection Kit puts the following items in various places your System Folder:

- AppleGuide 1.2.5
- ObjectSupportLib 1.1 (AppleScript document)
- Config PPP ver 2.1.4 Control Panel
- PPP 2.1.4 extension and PPP Preferences (Preference Folder)
- MacTCP 2.0.6, MacTCP Prep, MacTCP Token Ring extension, Hosts file (are installed if you do not have Open Transport).
- Internet Config extension
- Internet Dialer Folder (Preferences Folder)
 - Modem Information
 - Internet Dialer Prefs
 - reg server
- Launcher 2.8, and Launcher Preferences
- QuickTime 2.1, Apple MultiMedia Tuner 2.0, QuickTime Musical Instruments, QuickTime PowerPlug
- Sound Manager 3.1, Sound control panel 8.0.5
- RealAudio Daemon

- Netscape preferences (Preferences Folder)
- Additional Fonts

Newton 2.0 OS: Determining Size and Number of Faxes (1/96)

=====

Article Created: 3 January 1996

TOPIC -----

I have a Apple MessagePad 120 with the Newton 2.0 OS. How many fax messages can I receive? Also, what is the maximum size for fax documents?

DISCUSSION -----

The number and the size of fax documents vary. There are two factors that determine these numbers on your Apple MessagePad.

- Free Heap Space:

This is the amount of memory available to the system software to run the Newton. It will determine how large in size the page can be. On average, a fax page takes about 40 KB.

NOTE :

If you have trouble receiving a fax, try disabling some of the packages on your Newton MessagePad.

- Available Storage Space:

This is the amount of memory you have available on the internal store or a PC card, if you have one. This determines the number of pages you can receive.

Floppy Disk Maker: Starting New Backup After Interrupting 1/96

Revised: 1/5/96
Security: Everyone

Floppy Disk Maker: Starting New Backup After Interrupting 1/96

=====

Article Created: 3 January 1996
Article Reviewed/Updated: 5 January 1996

TOPIC -----

I was using the Floppy Disk Maker software that came with my PowerBook computer to make a set of backup System software disks. I had to stop the procedure in the middle of the process. Now I want to make another set, but the only option I get is Resume when I launch the Floppy Disk Maker. How can I create a new backup set?

DISCUSSION -----

If the Floppy Disk Maker software that ships with the PowerBook 190, 2300c, and 5300 series computers is interrupted during the disk duplicating process, "resume" is the only option available until you complete the original backup.

You can reset Floppy Disk Maker by dragging the Floppy Disk Maker Preferences file from the Preferences folder of your System Folder to the Trash. The next time you launch Floppy Disk Maker, the choices for Minimum or Full Set backup will be available.

HyperCard 2.3.3: Read Me (1/96)

Revised: 1/3/96
Security: Everyone

HyperCard 2.3.3: Read Me (1/96)

=====

Article Created: 3 January 1996

TOPIC -----

This article contains the ReadMe included with HyperCard 2.3.3 software update posted online.

DISCUSSION -----

WELCOME TO HYPERCARD 2.3.3
=====

Please read this entire "Read Me" file. It contains important information regarding this update. We recommend that you print a copy.

This update disk fixes a problem that occurs when a color stack is created, using HyperCard 2.3, on one Macintosh computer with a PowerPC microprocessor and crashes when run on another Power Macintosh with a PowerPC microprocessor.

The HyperCard 2.3.3 Update corrects a bug that causes a crash when:

- 1) A stack is created in HyperCard 2.3 on a Macintosh with a PowerPC microprocessor
- 2) Color Tools are opened from the Color menu item
- 3) The color resources ARE installed into the new stack
- 4) The stack is then launched on a different Macintosh with a PowerPC microprocessor

The bug does not affect stacks running on Macintosh computers with a 680x0 microprocessors.

The bug does not affect stacks created on a Macintosh computer with a PowerPC

microprocessor and then launched on a 680x0 microprocessor.

This bug does not affect stacks that do not use Color Tools.

The enclosed HyperCard 2.3.3 Update disk contains two stacks; an updated version of "Color Tools" (version 2.3.3) as well as a stack entitled "Update Existing Colored Stacks".

Stack #1 - Color Tools (Version 2.3.3)

Replace your old version of Color Tools by placing the Color Tools (version 2.3.3) stack into your HyperCard 2.3 folder on your hard drive.

Stack #2 - Update Existing Colored Stacks

If you have any stacks created with HyperCard 2.3 that are affected by the bug mentioned above, you can use the "Update Existing Colored Stacks" to repair those stacks so that they will no longer crash when running on another Macintosh Computer with a PowerPC microprocessor.

To repair a color stack created with HyperCard 2.3:

Step 1

Click on the "Repair Stack" button

Step 2

Locate the color stack you wish to update

Step 3

Select "Open" from the dialog box

Step 4

Your stack will be repaired automatically

CHANGES TO THE HYPERCARD REFERENCE MANUAL

=====

On page 6-33 the Reference Manual describes using "LinkTo" as follows:

"2. With the Button Tool still selected, double-click the button you want to link.

The Button Info dialog box appears."

While the Button Info dialog box does appear, the problem is that the Button

Info dialog box does not display the "LinkTo..." button unless the option key is held down while double-clicking the button you want to link.

On page 3-22 the Reference Manual describes using " Effects" as follows:

"1. Choose the Button Tool and double-click the Next button.

The Button Info dialog box appears

2. Click the Effect button."

While the Button Info dialog box does appear, the problem is that the Button Info dialog box does not display the "Effect..." button unless the option key is held down while double-clicking the button you want to add an effect to.

On page 6-37 the Reference Manual describes using " Effects" as follows:

"2. Double click the Button

The Button Info dialog box appears

3. In the Button Info dialog box, click Effect."

While the Button Info dialog box does appear, the problem is that the Button Info dialog box does not display the "Effect..." button unless the option key is held down while double-clicking the button you want to add an effect to.

Pages 2-29, 4-20, 6-3, 6-17 of the HyperCard Reference Manual shows an incorrect depiction of the Button Info dialog box when a button is Option-Double Clicked. On these pages, the position of the "LinkTo..." and "Effect..." buttons are transposed with the "Icon..." and "Contents..." buttons in the Button Info dialog box.

NOTE: Appendix B, page 141 of the Getting Started Guide documents the replacement of the "LinkTo..." and "Effect..." Buttons with the "Tasks..." button in HyperCard 2.3.

Power Macintosh 8500: Video Output Hardware Zoom (4/96)

Revised: 4/17/96
Security: Everyone

Power Macintosh 8500: Video Output Hardware Zoom (4/96)

Article Created: 3 January 1996
Article Reviewed/Updated: 14 February 1996

TOPIC -----

I've heard that the Power Macintosh 8500 computer has a hardware zoom option, but I am unable to find any mention of it in the literature that came with my computer.

DISCUSSION -----

The Power Macintosh 8500 includes a high performance chip set, which is capable of doubling the size of the video image displayed when outputting video to television. This feature could be useful for viewing video because movies will appear to be played back at full screen. These resolutions do not affect the actual data being displayed, but they do magnify the size of the image.

Follow these steps to enable resolution doubling:

Step 1

Follow the instructions in your User's Guide to display video on television.

Step 2

At the Finder, select the Monitor Resolution module (checkerboard) in the Control Strip. (Or, you can change the resolutions using the Sound & Displays control panel.)

Step 3

Select 256x192 for hardware doubled underscan (leaves a border like a computer display) or 320x240 for hardware doubled overscan (full frame, picture goes to edge like a television display)

Macintosh Performa: Using Auto Power On/Off Control Panel (1/96)

Revised: 1/19/96
Security: Everyone

Macintosh Performa: Using Auto Power On/Off Control Panel (1/96)

Article Created: 4 January 1996
Article Reviewed/Updated: 19 January 1996

TOPIC -----

I just installed the Auto Power On/Off control panel from a System 7.5 CD on my Macintosh Performa 5300CD. It appears to be working properly, but since this software did not come with my computer, I am wondering if I can safely use this control panel.

DISCUSSION -----

The Auto Power On/Off control panel can be used to turn the computer ON and OFF at specified times. It can only be used on computers, including many Macintosh Performa computers, that can be turned off using the Shut Down command (soft power off) and that have the "Cuda" ADB controller chip. A complete listing of compatible computers is in the Tech Info Library article, "Energy Saving Control Panels: Description & Compatibility."

Although the Auto Power On/Off control panel is compatible with many Macintosh Performa computers, it is not bundled with them. Many Macintosh Performa computers include modems and MegaPhone software, which allow you to use your computer as an answering machine. If you have installed Auto Power On/Off, it is possible for your computer to be inadvertently shut down while your computer is set to answer phone messages. To avoid this, Macintosh Performa computers do not ship with the Auto Power On/Off control panel.

PowerBook: Turns On Automatically If AC Power Used (3/97)

Revised: 3/10/97
Security: Everyone

PowerBook: Turns On Automatically If AC Power Used (3/97)

Article Created: 4 January 1995
Article Reviewed/Updated: 10 March 1997

TOPIC -----

I have a Macintosh PowerBook computer. If I have it plugged into the AC adapter and I select Shut Down from the Special menu, it powers off, but then powers right back on even though I have not touched any keys.

If AC adapter is not plugged in, the computer will Shut Down normally. However, as soon as the AC adapter is plugged in, it will power back on. What is wrong? Why does it restart itself automatically like this?

DISCUSSION -----

The symptoms you describe could occur on a Macintosh PowerBook 190, 1400, 3400, or 5300 series computer. The situation you describe is often caused by a corruption of the power manager controller on the logic board or corrupted Parameter RAM (PRAM) which can cause it to restart continually like this. It has been successfully resolved in some cases by one of the following three procedures:

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

All of the following Power Manager Reset procedures for all of the Macintosh PowerBook computers will permanently remove a RAM disk, if present, and all of its contents. Resetting the Parameter RAM will reset some settings you have selected for networking other services back to the factory defaults.

*** WARNING ***** WARNING ***** WARNING ***** WARNING ***** WARNING ***

Reset the Parameter RAM (PRAM)
=====

Reset/zap the Parameter RAM (PRAM) from shutdown state. Resetting ("Zapping") the Parameter RAM (PRAM) when the computer is shutdown also resets the power

manager.

Step 1

Unplug the AC adapter.

Step 2

Power on the computer while it is running from the battery only.

Step 3

Immediately after you press the power key, hold down Option, Command (Apple), P, and R.

Step 4

Keep holding down these four keys until you have heard the startup chime at least one additional time after the initial startup chime*.

(If your PowerBook computer emits multiple chimes when you are holding down the Option-Command-P-R keys, skip to Step 7.)

Unlike other PowerBook models, often these PowerBook computers will be only emit a single startup chime. Then the screen goes dark/blank and the green sleep light stays on solid (not blinking on and off like it does when the computer is in Sleep mode).

Step 5

Press the Reset button (on the back of the PowerBook) one more time and the PowerBook starts up after a brief pause.

NOTE:

If the PowerBook powers off and the sleep display light stays a solid green - no blinking, press the reset button once.

Step 6

If the PowerBook does not turn on from the Reset button, turn the PowerBook on by pressing the Power-On key in the upper right corner of the keyboard.

Step 7

After the computer has started up select Shut Down from the Special menu.

Step 8

Plug in the AC adapter. If the computer remains shutdown, you will know that you have successfully reset the PRAM and power manager and your computer should now function normally. If the computer powers on when you plug in the AC adapter, you need to reset the power manager.

Reset The Power Manager

=====

Step 1

Remove the battery.

Step 2

Disconnect the AC Adapter from the PowerBook and unplug it from the wall outlet.

Step 3

Press and hold the Reset button for one minute. The Reset button is located behind the port access door on the back of the unit below the video connector.

Step 4

Plug the AC Adapter into the wall outlet.

Step 5

Plug the AC Adapter into the PowerBook. It should now behave normally when you choose Shut Down from the Special menu.

If it does not, ...

Step 6

If the computer powers on when you plug in the AC adapter, you need to bring your computer to an authorized Apple dealer or call 800-SOS-APPL to check on your service options.

Have the Backup Battery Removed

=====

Have an authorized Apple Service technician remove all power from the computer for approximately 15 minutes.

Step 1

Remove the main battery(ies) and AC Adapter.

Step 2

Disconnect the backup battery.

Step 3

Wait 15 minutes and then retest for original problem.

IMPORTANT NOTE: Removal of the backup battery should only be done by an authorized Apple service provider because the backup battery is not a user-accessible part. Be advised that if an end user attempts to perform this procedure and in the process damages any components, any damage incurred will not be covered under warranty. If you do not have access to a local service provider, you can call 800-SOS-APPL to have your PowerBook computer sent in for repair at the Apple Service Center.

PowerBook: About PC Card Modem Files Read Me (1/96)

Revised: 5/2/97
Security: Everyone

PowerBook: About PC Card Modem Files Read Me (1/96)

Article Created: 4 January 1996
Article Reviewed/Created: 1 May 1997

TOPIC -----

This Readme file is pre-installed on the hard drives of most Macintosh PowerBook computers which have the capability of using PC Card modems.

DISCUSSION -----

=====

ABOUT PC CARD MODEM FILES

=====

The PC Card Modem Files folder contains modem connection files for various PC Card modems that will work with several application programs. If your modem file is not included, please contact your communications software manufacturer to see if your modem is supported.

Using a PC Card Modem

=====

Follow these steps as a guideline for setting up communications programs to use the Communications Toolbox.

Note: The files listed below were designed to work with the United States phone system. These files may or may not work properly outside of the United States.

To select the correct modem file for your PC Card modem, follow these steps:

Step 1

Insert your PC Card modem.

Step 2

Click the Edit Local Setup button.

Step 3

Select the port that your PC Card modem is in. You should see either upper or lower PC Card slot listed. If you don't, make sure your modem is properly inserted. The upper and lower PC Card slots will appear in the dialog box only when a PC Card modem is inserted.

Step 4

Choose your modem from the Modem Type pop-up menu. If your PC Card modem is not listed, try Generic PC Card Modem or Hayes Basic. If that doesn't work, you may need to create a new modem type.

Using Apple Remote Access with a PC Card Modem

=====

Apple Remote Access (ARA) uses modem files (sometimes called connection scripts or CCLs) to get the best performance from some modems. Follow these steps to select your modem file:

Step 1

Insert your PC Card modem.

Step 2

Open the ARA application program.

Step 3

Open Remote Access Setup.

Step 4

Choose your modem from the Modem pop-up menu. If your PC Card modem is not listed, check in the ARA Connection Files folder. If the file for your modem appears, drag it to the Extensions folder (inside the System Folder). If the file for your modem is not listed, try using an existing modem file from the pop-up menu (such as a different model from the same manufacturer). If this doesn't help, you may need to get a connection script from your PC Card manufacturer.

Step 5

Choose the port that your PC Card modem is in. You should see either upper or lower PC Card slot listed. If you don't, make sure your modem is properly inserted. If you insert the PC Card modem in the other slot, you need to reselect the modem port before you can use ARA.

Using AppleLink with a PC Card Modem

=====

To use AppleLink with a PC Card modem, follow these steps after you have installed the AppleLink software:

Step 1

Insert your PC Card modem.

Step 2

Open the AppleLink Connection Files folder (inside the PC Card Modem Files folder in the Apple Extras folder on your hard disk).

Step 3

Drag the icon for the PC Card Modem (USA) file to the Connection Files folder (inside the AppleLink folder). If a dialog box appears advising you that older files with the same name already exist, click OK.

Step 4

Open the AppleLink application program.

Step 5

Choose Set Up Connection from the Network menu.

Step 6

Choose CommToolbox from the Connection Port pop-up menu.

Step 7

Choose Serial Tool from the Method pop-up menu.

Step 8

Select the Upper Slot or Lower Slot icon in the Current Port window. The modem must be inserted to display its icon in the window. You must always insert the modem in the same slot, or you'll need to set up the modem again for the other slot.

Step 9

Choose PC Card Modem (USA) from the Connection File pop-up menu.

Business Education Bundle v3.3: Contents (3/96)

Revised: 3/13/96
Security: Everyone

Business Education Bundle v3.3: Contents (3/96)

Article Created: 4 January 1996
Article Reviewed/Updated: 13 March 1996

TOPIC -----

This article lists the software contents of the Business Education Bundle.

DISCUSSION -----

The Business Education Bundle is a Education market product comprising a collection of software CD-ROM discs, manuals, and curriculum guides. There are three parts to this bundle. The (basic) Business Education Bundle includes a computer, software CD-ROM discs, and curriculum materials. The Teacher Kit (T1538LL/B) includes manuals and textbook teacher guides. The Student Kit (T1800LL/A) contains instructional manuals for students. The Teacher and Student kits are sold separately as additions to the (basic) Business Bundle and contain no software so it is recommended not to order them without the basic Bundle.

Here is the content of the Business Education Bundle (v3.3):

- Bundle Users manual(s): None
 - Curriculum Guide: 1
- Table of Contents:
- Welcome and Introduction,
 - Tips to Get Started,
 - Becoming Familiar with the Curriculum Materials,
 - Using the Curriculum Materials in Your Classroom or Business Lab,
 - How the Software Fits Into Your Curriculum,
 - Appendix A: Resources for Using Technology in Business Education,
 - Appendix B: Technical Assistance Numbers for Third Party Developers
- Student Textbook Kit (manuals from South-Western Publishing):
 - ClarisWorks 4.0 Macintosh Quick Course
 - Computer Applications
 - Official Courseware: WordPerfect 3.5

- Automated Accounting 6.0

- 6 CDs:

1 Business Education (v3.3): These items are installed into a Business Education Applications Folder

- Automated Accounting (v6.0.1) - South-Western Publishing (800) 543-0453]
- American Heritage Dictionary (v3.0.1) - SoftKey Int'l. (404) 428-0008]
- Correct Grammar (v3.2.2) - SoftKey Int'l. (404) 428-0008]
- ClickArt Business Illustrations (v n/a) - T/Maker Company (415) 962-0195]
- Apple Font Pack - Apple Computer - (800) 767-2775
- Clarisworks Samples Files
- Teacher Templates
- Computer Applications Templates
- Clarisworks Templates
- WordPerfect Course Documents

1 Clarisworks (v4.0) - Claris - Tech Support (408) 727-9054

1 Claris Impact (v2.0) - Claris - Tech Support (408) 727-9054

1 The 1995 Grolier Encyclopedia (v7.0.4) - Mindscape - Tech Support (415) 898-5157

1 1995 Time Almanac (v1.0) - Compact Publishing - Tech Support (202) 244-4770

LaserWriter 8.2.3f: Read Me (1/96)

Revised: 1/4/96
Security: Everyone

LaserWriter 8.2.3f: Read Me (1/96)

=====

Article Created: 4 January 1996

TOPIC -----

This article contains the ReadMe file included with the LaserWriter 8.2.3f software posted online.

DISCUSSION -----

About the LaserWriter 8 Fax Printer Driver Version 8.2.3f

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference.

The software on this disk includes version 8.2.3f of the Apple LaserWriter 8 fax printer driver, which works with the LaserWriter Select 360f, LaserWriter Pro 810f, and the LaserWriter 16/600 PS Fax. This document includes information about the software, as well as about several of the printers.

About the LaserWriter 8f Printer Driver

When you set up your printer, you install the LaserWriter 8 printer driver and the fonts and printer software that you need. When you install the fax card option, you also must install the LaserWriter 8 fax printer driver to enable the printer's faxing capabilities. Both drivers are installed in the Extensions folder in your System Folder. They provide identical printing capabilities. To use the fax capabilities of your printer, you should open the Chooser and select the fax driver whenever you want to use the printer for faxing.

Installing the Printer Driver Software

The manual that comes with your printer contains detailed installation instructions. You cannot install the software by dragging icons; you must use

the Installer program as described in the printer manual.

IMPORTANT Before installing the printer software, you should restart your system with all Extensions turned off. To do this, hold down the Shift key while you restart your computer.

The Installer places the following files in the System Folder on your hard disk:

- LaserWriter 8f is placed in the Extensions folder.
- The PostScript Printer Description (PPD) files that are used by LaserWriter 8 are in the Printer Descriptions folder located in the Extensions folder.
- The Apple Printer Utility and Read Me information are placed in the Apple LaserWriter Software folder.
- The LaserWriter Fax Utility and LaserWriter Fax Log are installed in a folder called LaserWriter Fax Software (placed within the System Folder).
- The Chooser 7.3 desk accessory is placed in your Apple Menu Items folder if you have an older version.
- The PrintMonitor 7.1.2 is placed in your Extensions folder if you have an older version.

About PPD Files

The LaserWriter 8f driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle. Installing the fax card software for the printer installs an additional PPD that supports the faxing capabilities of the printer.

To take full advantage of your printer's features, click the Setup button in the Chooser when selecting your printer for the first time or after installing an additional option. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer. The driver will automatically select the PPD that supports the faxing capabilities of your printer.

About Creating EPS Files

You can create an Encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, an extremely large file may be created.
- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you

print.

- When you create EPS files with preview information included, other applications that create their own PostScript code may not display the EPS file accurately on the screen.

About the LaserWriter Fax Utility and the Apple Printer Utility

Installing the LaserWriter Fax printer driver software installs the LaserWriter Fax Utility, which you should use to configure the faxing capabilities of the printer.

When you installed the LaserWriter 8 driver and printer software, the Installer placed the Apple Printer Utility program in a folder named "Apple LaserWriter Software." The Apple Printer Utility program is designed to configure your LaserWriter printer.

Using a Hard Disk to Store Fax Data

If a hard disk is attached to your printer, you can use it to hold incoming fax data before it is printed, and to hold outgoing fax data before it is transmitted. (By default, fax jobs are stored in printer RAM.)

Because more space is typically available on a hard disk than in RAM, storing fax data on a hard disk allows you to receive and transmit longer faxes without having to divide them up into smaller transmissions.

To configure your printer to use an attached hard disk to store fax jobs, open the Apple Printer Utility and choose Send PostScript File from the File menu. Select the file "UseDiskForFax" in the LaserWriter Fax Software folder in the System Folder, click Add, then click Send.

To configure your printer to use RAM to store fax jobs, open the Apple Printer Utility and choose Send PostScript File from the File menu. Select the file "UseRAMForFax" in the LaserWriter Fax Software folder in the System Folder, click Add, then click Send.

After downloading either file to the printer, you must restart the printer for the change to take effect.

IMPORTANT If you use a hard disk to hold fax data and you later want to disconnect the hard disk from the printer, be sure to configure the printer to use RAM to store fax jobs before you remove the hard disk. Otherwise, your printer will take a little longer to start up the first time when it detects that the hard disk has been removed.

Using the LaserWriter 8 Fax Printer Driver With LaserWriter Printers

=====

When using the LaserWriter 8.2.3f driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers

- The LaserWriter 8.2.3f driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text in some documents reflows or is clipped to fit the new imageable area. To maintain your document format when printing to different printer models, deselect the Larger Print Area option in the Page Setup Options dialog box.
- Some older printers with small amounts of memory will not print documents containing large numbers of fonts unless the Unlimited Downloadable Fonts option is selected in the Page Setup Options dialog box. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup Options dialog box and print again.
- Printing multiple documents with the Finder may not work if the documents have been created by different application programs.
- If you encounter a time-out (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.
- Note the following when you create rotated text, saved as a PICT file, and import it into a document as a graphic: Though you may position rotated text in the frame so that parts of it should not be visible and should not print (is clipped), the text will still appear on the printed document.

LaserWriter 16/600 PS

- If Tray Switching is turned on and you have installed the optional 500-sheet feeder, and it contains the same paper size as the 250-sheet feeder, you should set up the driver to use the 500-sheet feeder as the preferred paper source for optimal printing performance. See the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

LaserWriter Pro 810

- With some graphics programs, bitmapped graphics will be reduced by 25% in size when printed with the Precision Bitmap Alignment option in the Page Setup Options dialog box.
- When you create a PostScript file with a LaserWriter Pro 810 selected as the printer and send the file to a printer that uses PostScript Level 1, a PostScript error will occur.

LaserWriter Pro 600 and 630

- You cannot use Auto Select as the Paper Source in the Print dialog box to print envelopes from the optional envelope feeder.

- When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

LaserWriter II NT and II NTX

- If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.
- Do not use the B5 tray to print envelopes on a LaserWriter II NT. Use the letter tray instead.

LaserWriter IIg and IIx

- When you select paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.
- The US Legal paper size has been changed on some LaserWriter IIx/IIg printers to be more compatible with other Apple LaserWriter printers. If your legal-sized documents no longer fit on the page, select Larger Print Area in the Page Setup Options dialog box.
- Some form-printing programs cannot print forms using the Layout settings in the Page Setup dialog box.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.1.1 or later.

Using the LaserWriter 8 Driver With Application Programs

=====

Some application programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

- With many programs, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.

Aldus Freehand 4.0

- Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- EPS files created using the LaserWriter 8 driver from within Freehand cannot

be used in other programs.

Aldus PageMaker 5.0

- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

Canvas 3.5

- When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if fonts Geneva, New York or Monaco are used.

CricketDraw III 2.01

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, underlined TrueType fonts may not print.

CricketPresents 2.1

- You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

FileMaker Pro 2.1

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Freehand 5.0

- When you are printing with Freehand 5.0, make sure to set the Output Device Setup in the Print Options dialog box to "Use defaults." If you have a PPD selected, the QuickDraw GX driver will only print a blank page.

Informed Manager 1.4

- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

Lotus 1-2-3 1.1

- Text printed with the Outline or Shadow text style appears filled with gray.

MacDraft 3.01 and earlier versions

-
- When you print using the Cut Marks option, a PostScript error results.

Microsoft PowerPoint 3.0

-
- Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

-
- Printing documents that have rotated objects with rounded corners results in a PostScript error.

Painter 2.0

-
- When you print using the Invert option, images do not print inverted correctly.

PixelPaint Pro 3.0

-
- When you print using the Invert option, images do not print inverted correctly.

QuarkXPress 3.3

-
- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

RagTime 3.2

-
- You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

-
- Use ReadySetGo! version 6.0 with the LaserWriter 8 printer driver; earlier versions will not work.
 - You cannot print documents that use pen patterns.

SoftWindows

-
- When you print with Autosend on, don't select the option to print before the print job has finished spooling to the Macintosh, or PostScript syntax errors will occur.

Studio/8 & Studio/32

-
- When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.

WordPerfect 3.0

-
- When you select the Unlimited Downloadable Fonts option and print rotated text in Watermark, the entire document rotates when printed.

How to Get Updated Printer Software

If you need to update your printer software and you have an AppleLink account, you can obtain the latest versions of the LaserWriter 8 software from AppleLink.

Follow this path to locate the LaserWriter 8 software:

Apple Products
Apple Software Updates
Macintosh
Printing Software

The latest LaserWriter 8 software is also available from Apple's ftp site on the Internet. The path is:

/ftp/dts/mac/sys.soft/laserwriter.8.2/.

Printing With QuickDraw GX

=====

Using Manual Feed

- If you select manual feed, and the printer still prints from the cassette, try to print by selecting Automatic Paper Feed from the GX Print dialog box first. Then, print again by selecting Manual Feed.

Freehand 5.0

- When you print with Freehand 5.0, make sure to set the Output Device Setup in the Print Options dialog box to "Use defaults." If you have a PPD, selected the QuickDraw GX driver will only print a blank page.

Power Macintosh 7100: NuBus Power Requirements (1/96)

Revised: 1/4/96
Security: Everyone

Power Macintosh 7100: NuBus Power Requirements (1/96)

Article Created: 4 January 1996

TOPIC -----

What are the power requirements of the NuBus slots in the Power Macintosh 7100?

DISCUSSION -----

The power budget for each NuBus slot is 13.9 watts, for a total of 41.7 watts, and the power budget for each NuBus card is as follows:

Begin_Table

Voltage (V)	Maximum current (A)	Maximum capacitance (mF)
+5	2.0	1513
+12	0.175	536
-12	0.15	698

End_Table

These NuBus power requirements also apply to the Macintosh IIVx and the Macintosh Quadra 650, which both share a common case design with the Power Macintosh 7100.

Color LaserWriter 12/600 PS: Quark Xpress Pantone Colors (1/96)

Revised: 1/26/96
Security: Everyone

Color LaserWriter 12/600 PS: Quark Xpress Pantone Colors (1/96)

Article Created: 4 January 1996
Article Reviewed/Updated: 26 January 1996

TOPIC -----

I am using QuarkXPress and printing on the Color LaserWriter 12/600 PS. I am using the Color LaserWriter 12/600 PS Pantone files for QuarkXPress, and the printing result is what I expect (the colors are similar). Problems start to arise when I have the file printed by a printing firm, because the Color LaserWriter 12/600 PS pantone color percentage values are different from the ones normally used in the Pantone specification. Is there a utility or a way to convert the LaserWriter Color 12/600 PS Pantone color values into true pantone values?

DISCUSSION -----

You are correct that the values in the Quark Xpress Pantone files for the Color LaserWriter 12/600 PS are different than those specified by the Pantone specification. The CMYK values provided in the Pantone specification are more or less "starting points" for color matching. Since there are a very large number of variables in color matching (type of paper, lighting condition, different toner/inks, characteristics of various print engines, and so forth), desktop publishing professionals by requirement have to fine tune their printers or color values in order to get the output they desire.

The Pantone CMYK values in the Quark document for the Color LaserWriter 12/600 PS are fine-tuned ONLY for the Color LaserWriter 12/600 PS printer. It appears you are trying to use the Color LaserWriter as a color proofer, which is NOT what the printer was really designed for. There are much more expensive color proofing devices available that are designed specifically for this need.

There are no utilities available for converting the Quark Pantone values to the Pantone specification, nor is there a "formula" for calculating the difference. Pantone most likely measured each individual color and determined what CMYK values on the Color LaserWriter 12/600 PS printer most closely matched their colors.

If you use a Pantone swatch, the colors on the swatch should be very close to those produced by the Color LaserWriter 12/600 PS Printer using the "PANTONE for Color LW 12/600 PS" files. Your final output should be exactly the same as the Pantone swatch. Printers adjust their ink values so that the colors match the Pantone swatch books. Since Pantone swatch colors fade over time, you should use a recent swatch book for color matching.

PowerBook: Password Security Frequently Asked Questions (3/96)

Revised: 3/28/96
Security: Everyone

PowerBook: Password Security Frequently Asked Questions (3/96)

Article Created: 4 January 1996
Article Reviewed/Updated: 28 March 1996

TOPIC -----

This article answers some frequently asked questions (FAQ) about the PowerBook password protection software.

The following questions are answered in this FAQ:

- 1) What do I do if I forget my password? Is there a way to bypass it?
- 2) I activated password protection on my PowerBook computer. Now when I try to access it, it does not recognize my password. I know I am entering the correct password. I also see an arrow in the password field. What does the arrow mean?
- 3) I opened the password Security control Panel and clicked the ON radio button and I get a message that says "You must turn off password protection before using this PowerBook in SCSI disk mode. I am not trying to use SCSI disk mode. What should I do?
- 4) I am at the password entry screen and the OK button is dim (greyed out) and there is no cursor in the window so I can't enter my password.

DISCUSSION -----

1) Question: What do I do if I forget my password? Is there a way to bypass it?

Answer: If you forget your password you cannot bypass the system by booting with extensions off or booting from the Disk Tools disk because the password is written to your drive at the driver level. Your only option is to take your PowerBook with your proof of purchase (receipt) to an authorized Apple service center where a technician has the means to bypass the security on the system. The Apple technicians at 800-SOS-APPL CANNOT help you bypass the password for security reasons.

2) Question: I activated password protection on my PowerBook computer. Now when I try to access it, it does not recognize my password. I know I am entering the correct password. I also see an arrow in the password field. What does the arrow mean?

Answer: The arrow indicates the caps lock key is down. Since password protection is case sensitive, simply releasing the caps lock key causes the arrow will disappear and solve the problem.

3) Question: I opened the password Security control Panel and clicked the ON radio button and I get a message that says "You must turn off password protection before using this PowerBook in SCSI disk mode. I am not trying to use SCSI disk mode. What should I do?

Answer: Simply press the ok button or return. This is just a general warning message. Once you press OK the password entry screen will come up.

4) Question: I am at the password entry screen and the OK button is dim (greyed out) and there is no cursor in the window so I can't enter my password.

Answer: You will not get a blinking cursor in the password entry area. Simply enter the password and you will see security dots (bullets) appear in the window (•). This is to prevent someone from reading your password when you enter it. Once these dots appear in the window the OK button will darken and you can complete the process of activating your password.

This article was published in the Information Alley on 27 March 1996.

Macintosh Computers: Personal LW SC & IIsC Printing Issue (1/97)

Revised: 1/29/97
Security: Everyone

Macintosh Computers: Personal LW SC & IIsC Printing Issue (1/97)

Article Created: 4 January 1996
Article Reviewed/Updated: 29 January 1997

TOPIC -----

I have a Macintosh computer and an Apple Laserwriter IIsC. When I print to a LaserWriter IIsC (SCSI) printer from a variety of applications the fonts seem to overflow the area that is designated for the text. It looks fine on the screen, but this problem happens every time I print to this pritner.

Other printers accessed over LocalTalk or EtherTalk work fine. I have no extra SCSI devices (internal or external). I am not using any font management software like ATM or Suitcase. I am using true type fonts. Helvetica and Times are the two fonts that I use the most. What's wrong?

DISCUSSION -----

Issue

All Macintosh computers, including PowerBook computers, have a compatibility issue with Personal LaserWriter SC driver version 7.0.1 (included with System software 7.1.1 and 7.5) or earlier versions.

When printing from a Macintosh computer using System Software 7.5.2 or newer to a LaserWriter IIsC or Personal LaserWriter SC, the line layout is very poor and definitely not "what you see is what you get" (WYSIWYG).

Workaround

The only workaround is to use QuickDraw GX. The LaserWriter IISC GX printer driver is used for both models of LaserWriter SC (the Personal LaserWriter SC and the LaserWriter IIsC).

Article Change History:
29 Jan 1997 - Revised to include all Macintosh computers.

Workgroup Server 7250/120: Description (9/96)

=====

Article Created: 5 January 1996
Article Reviewed/Updated: 10 September 1996

TOPIC -----

This article provides a description of the Workgroup Server 7250/120.

Important Note:

In September of 1996, a new product with the same name, Workgroup Server 7250/120, was introduced which has an 8x-speed CD-ROM drive and a 2 GB hard drive instead of a quad-speed CD-ROM drive and a 1.2 GB hard drive.

DISCUSSION -----

The Workgroup Server 7250/120 is an affordable and versatile member of the PowerPC processor-based Workgroup Server family from Apple. It delivers the file and print, database, Internet, and applications server capabilities that meet the needs of medium-sized workgroups in education, business, and publishing. And it's ideal for workgroups that use both Macintosh and Windows software-based computers.

Apple Workgroup Servers are highly reliable, affordable, high-performance systems with large storage capacity that provide organizations with faster, more efficient shared network services and secure centralized storage. The Workgroup Server 7250/120 not only meets these criteria, but also runs the familiar graphical interface of the Mac OS, making all of its capabilities incredibly easy to use.

Featuring a 120-megahertz PowerPC 601 processor with 32K on-chip cache and 256K level 2 memory cache, the Workgroup Server 7250/120 delivers outstanding performance. And for easy, flexible expansion, the Workgroup Server 7250/120 features three PCI slots that let you add capabilities by installing any of a variety of cards.

To make sure that network administrators can work as efficiently as possible, and that users get the most out of all that power and capacity, the Workgroup

Server 7250/120 offers a choice of three software bundle solutions. The Applications Server Solution provides a variety of useful Apple and third-party software for administration, reliability, productivity, and performance. The AppleShare Server Solution includes all of the software that comes with the Applications Server, plus a new version of AppleShare file and print server, remote administration software from Santorini, and Apple Remote Access MultiPort Server software. And the Apple Internet Server Solution comes with all the software you need to create a presence on the World Wide Web-quickly and easily. No matter which option you choose, the Workgroup Server 7250/120 also includes AppleShare Client for Windows software, so Windows users on the network can access networked printers and files stored on a Workgroup Server running AppleShare file and print software.

So if you want a server that can accommodate today's budget and expand to handle tomorrow's demands, the Workgroup Server 7250/120 is the server you've been waiting for.

Features

Expansion and storage

- Three PCI (Peripheral Component Interconnect) slots for expansion cards
- Internal 1.2 GB, 5400-rpm hard or 2 GB, 4500-rpm* hard disk drive and room for one additional storage device
- Internal quadruple-speed or 8x-speed CD-ROM drive*
- One SCSI DMA bus to support up to seven devices (three internal, four external)
- Eight ports to support a wide range of peripherals

* The 2 GB, 4500-rpm hard disk drive and 8x-speed CD-ROM drive are available in models M5482LL/A, M5483LL/A, and M5484LL/A; not in the earlier configurations.

Networking

- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk and TCP/IP networking protocols
- Token Ring support optional (with PCI card)

Power, speed, and memory

- 120-MHz PowerPC 601 RISC processor with floating-point processor and 32K on-chip cache
- 256K level 2 cache
- 16MB of RAM, expandable to 256MB

Fast, easy setup

- Comes with System 7.5.3 software installed
- Includes AppleShare 4.2.1 file and print server software (some configurations)

Compatibility

- Comes with AppleShare Client for Windows

Bundled software

- Includes a variety of software for administration, reliability, productivity, and performance

Service and support

- Hardware troubleshooting for the life of the server; 90 days of assistance for Apple-branded software (phone support)
- One-year, on-site hardware warranty providing two-business-day response
- Additional service and support available

Ordering Information

=====

Workgroup Server 7250/120 Applications Server Solution

(16 MB/2GB/CD)

Order No. M5482LL/A

- 256K level 2 cache, 1.4 MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3
- Server Solutions CD and other bundled software

Workgroup Server 7250/120 AppleShare Server Solution

(16 MB/2GB/CD)

(AppleShare Server Solution)

Order No. M5483LL/A

- Identical to Order No. M5482LL/A, plus AppleShare 4.2.1, Apple Remote Access MultiPort Server software, and Server Manager from Santorini

Workgroup Server 7250/120 Internet Server Solution for the World Wide Web

(16 MB/2GB/CD)

Order No. M5484LL/A

- 256K level 2 cache, 1.4 MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3
- Apple Internet Server Solution CD (WebSTAR; PageMill; MacDNS; HomeDoor; NetCloak; ServerStat; RealAudio; Acrobat Pro; HyperCard; Web connectivity software for your existing EveryWare Butler SQL and FileMaker Pro databases; Navigator; BBEdit; clickable maps, e-mail, and database AppleSearch CGIs; customizable WWW pages and forms; AppleScript and useful scripting additions; AppleSearch; Apple RAID). Does not include Workgroup Server Solutions CD, AppleShare 4.2.1, or Server Manager.
- Includes WebMaster Macintosh by Bob LeVitus and Jeff Evans

Included with all Workgroup Servers:

- Complete setup, learning, and reference documentation
- Limited one-year hardware warranty

Macintosh Memory Expansion Kits

A variety of memory expansion kits are available. 168-pin DIMMs are required. Check with your Apple reseller for details.

**ALL PRODUCTS BELOW THIS LINE WERE DISCONTINUED WHEN THE ABOVE PRODUCTS WERE
INTRODUCED**

Workgroup Server 7250/120 Applications Server Solution (Discontinued)

(16 MB/1.2GB/CD)

Order No. M4335LL/A

- 256K level 2 cache, 1.4 MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3
- Server Solutions CD and other bundled software

Workgroup Server 7250/120 AppleShare Server Solution (Discontinued)

(16 MB/1.2GB/CD)

Order No. M4336LL/A

- Identical to Order No. M4335LL/A, plus AppleShare 4.2.1, Apple Remote Access MultiPort Server software, and Server Manager from Santorini

Workgroup Server 7250/120 Internet Server Solution for the WWW (Discontinued)

(16 MB/1.2GB/CD)

Order No. M4337LL/A

- 256K level 2 cache, 1.4 MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3
- Apple Internet Server Solution CD (WebSTAR; PageMill; license for MacDNS domain name server software; NetCloak; ServerStat; RealAudio; Acrobat Pro; HyperCard; Web connectivity software for your existing EveryWare Butler SQL and FileMaker Pro databases; Navigator; BBEdit; clickable maps, e-mail, and database AppleSearch CGIs; customizable WWW pages and forms; AppleScript and useful scripting additions; AppleSearch; Apple RAID; AppleShare Client for Windows). Does not include Workgroup Server Solutions CD, AppleShare 4.2.1, or Server Manager.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Workgroup Server 7250/120: Technical Specifications (9/96)

=====

Article Created: 5 January 1996
Article Reviewed/Updated: 9 September 1996

TOPIC -----

This article provides the technical specifications for Workgroup Server 7250/120 products.

Important Note:

In September of 1996, a new product with the same name, Workgroup Server 7250/120, was introduced which has an 8x-speed CD-ROM drive and a 2 GB hard drive instead of a quad-speed CD-ROM drive and a 1.2 GB hard drive.

DISCUSSION -----

Technical Specifications
=====

Microprocessor -----

- PowerPC 601 RISC processor running at 120-MHz
- Integrated floating-point unit and 32K on-chip cache
- 256K level 2 cache

Memory -----

- 16 MB of RAM, expandable to 256 MB

Storage -----

- Internal 1.2 GB or 2 GB, 4500-rpm* hard disk drive; supports one additional storage device
- One AppleCD 600i CD-ROM drive (up to 600KB/s data-transfer rate) or 8x-speed CD-ROM drive (up to 1.2 MB/s data-transfer rate)*
- One Apple SuperDrive 1.4 MB floppy disk drive that reads, writes, and formats Mac OS, Windows, MS-DOS, and OS/2 disks

* The 2 GB, 4500-rpm hard disk drive and 8x-speed CD-ROM drive are available in models M5482LL/A, M5483LL/A, and M5484LL/A; not in the earlier configurations.

Bundled software/Server Solutions CD

----- Administrative software

- Server Manager—remote AppleShare server management tools (with AppleShare Server Solution only) (one user license)
- FileWave—automated software and data distribution (10 user license)
- netOctopus—setup assessment and configuration file editing (10 user license)
- Adobe Acrobat Reader—viewing application for portable document format (PDF) files (10 user license)

Reliability software

- Apple RAID Software—data mirroring to protect against drive failures (RAID 1) (license for server)
- Virex—automated virus screening and virus check software (license for server)
- Retrospect Remote—automated backup software (DAT configurations only) (3 user license)

Productivity software

- AppleShare Client for Windows—enables Windows clients to connect to an AppleShare server (site license for network)
- 4-Sight FAX—lets you send and receive faxes from your desktop (10 user license)
- Now Contact—provides contact management tools (10 user license)
- Now Up•to•Date—handles group scheduling (10 user license)
- Viper Instant-Access—provides a cross-platform information retrieval system (10 user license)

Performance software

- Apple RAID Software—optimizes performance of multiple hard disks through disk striping (RAID 0) (license for server)
- Skyline/Satellite—enables monitoring of the network and server traffic over time (console and monitoring station license)

NOTE: The only software bundled with the 7250/120 Apple Internet Server Solution is Apple RAID Software, AppleShare Client for Windows, and the Internet Server Solution CD.

Networking

- ##### -----
- Built-in Ethernet with 10Base-T and AAUI
 - Two serial ports for LocalTalk
 - Supports TCP/IP networking software with Apple Open Transport software

Displays

- ##### -----
- Supports up to 14-inch Apple displays at up to millions of colors; 16- and 17-inch Apple displays at up to thousands of colors
 - Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in 1 MB VRAM display support

Interfaces

- Three PCI expansion slots
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- On-board Ethernet using either AAUI-15 or RJ-45
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- SCSI DMA bus supports up to four external and three internal SCSI devices
- 16-bit stereo sound input and output ports

Clock/calendar

- Custom integrated circuit with long-life lithium battery

Disability access

- System software includes CloseView and Easy Access, and provides the ability to substitute visual cue for beep. These built-in solutions and third-party options provide alternative input and output solutions for people with disabilities.

Keyboard and mouse

- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Electrical requirements

- Line voltage: 100 to 270 V AC, RMS single phase
- Frequency: 50 to 60 Hz, single phase
- Power: 150 W maximum, not including display

ADB power requirements

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Operating environment

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F
(-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and weight

- Height: 6.5 in. (15.6 cm)
- Width: 14.37 in. (36.5 cm)
- Depth: 16.93 in. (43.0 cm)
- Weight: 22 lb. (9.97 kg)—varies based on internal devices installed

Regulatory approval

- FCC Class B

Workgroup Server 8550/132: Description (3/97)

Article Created: 5 January 1996
Article Reviewed/Updated: 3 March 1997

TOPIC -----

This article describes the Workgroup Server 8550/132.

DISCUSSION -----

The Workgroup Server 8550/132 is the most powerful member of the PowerPC processor-based Workgroup Server family from Apple. It delivers file and print, database, Internet, and communications capabilities that meet the needs of growing workgroups in education, business, and publishing. And it's ideal for workgroups that use both Macintosh and Windows software-based computers.

Apple Workgroup Servers are highly reliable, high-performance systems with large storage capacity that provide organizations with faster, more efficient shared network services and secure centralized storage. And the Workgroup Server 8550/132 not only meets these criteria, but also runs the familiar graphical interface of the Mac OS, making all of its capabilities incredibly easy to use.

Featuring a 132-megahertz PowerPC 604 processor with 32K on-chip cache and 512K level 2 memory cache, the Workgroup Server 8550/132 delivers all the performance benefits of state-of-the-art RISC technology. And for easy, flexible expansion, the Workgroup Server 8550/132 features three PCI slots that let you add capabilities by installing any of a variety of cards.

To make sure that network administrators can work as efficiently as possible, and that users get the most out of all that power and capacity, the Workgroup Server 8550/132 offers a choice of three software bundle solutions. The Applications Server Solution provides a variety of useful Apple and third-party software for administration, reliability, productivity, and performance. The AppleShare Server Solution includes all of the software that comes with the Applications Server, plus a new version of AppleShare file and print server, remote administration software from Santorini, and Apple Remote Access MultiPort Server software. And the Apple Internet Server Solution comes with all the

software you need to create a presence on the World Wide Web-quickly, easily, and affordably. No matter which option you choose, the Workgroup Server 8550/132 also includes AppleShare Client for Windows software, so Windows users on the network can access net-worked printers and files stored on a Workgroup Server running AppleShare file and print software.

So if you need a high-performance server for a demanding workgroup, we have the solution-the powerful and expandable Workgroup Server 8550/132.

Features

Expansion and storage

- Three PCI (Peripheral Component Interconnect) slots for expansion cards
- Internal 2GB, 7200-rpm hard disk drive, with bracket and cable for a second drive
- Internal quadruple-speed CD-ROM drive
- Internal DDS-2 digital audio tape (DAT) drive (some configurations)
- Two SCSI DMA buses to support up to eight devices and transfers up to 10MB/s (internal only)
- Eight ports to support a wide range of peripherals

Networking

- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk and TCP/IP networking protocols
- Token Ring support optional (with PCI card)

Power, speed, and memory

- 132-MHz PowerPC 604 RISC processor with floating-point processor and 32K on-chip cache on an upgradable CPU card
- 512K level 2 cache
- 24MB of RAM, expandable to 512MB

Fast, easy setup

- Comes with System 7.5.3 software installed
- Includes AppleShare 4.2.1 file and print server software (some configurations)

Compatibility

- Comes with AppleShare Client for Windows

Bundled software

- Includes a variety of software for administration, reliability, productivity, and performance

Service and support

- Hardware troubleshooting for the life of the server; 90 days of assistance for Apple-branded software (phone support)
- One-year, on-site hardware warranty providing two-business-day response
- Additional service and support available

TOPIC -----

This article provides the technical specifications of the Workgroup Server 8550/132.

DISCUSSION -----

Technical Specifications
=====

Microprocessor

- PowerPC 604 RISC processor running at 132-MHz, located on upgradable CPU card
- Integrated floating-point unit and 32K on-chip cache
- 512K level 2 cache

Memory

- 24MB of RAM, expandable to 512MB

Storage

- Internal 2GB hard disk drive, with bracket and cable for a second drive
- One DDS-2 DAT drive—4GB uncompressed, 14GB compressed (some configurations)
- One AppleCD 600i CD-ROM drive (up to 600KB/s data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that reads, writes, and formats Mac OS, Windows, MS-DOS, and OS/2 disks

Bundled software/Server Solutions CD

Administrative software

- Server Manager—remote AppleShare server management tools (with AppleShare Solution only) (one user license)
- FileWave—automated software and data distribution (10 user license)
- netOctopus—setup assessment and configuration file editing (10 user license)
- Adobe Acrobat Reader—viewing application for portable document format (PDF) files (10 user license)

Reliability software

- Apple RAID Software—data mirroring to protect against drive failures (RAID 1) (license for server)
- Retrospect Remote—automated backup software (DAT configurations only) (10 user license)
- Virex—automated virus screening and virus check (license for server)

Productivity software

- AppleShare Client for Windows—enables Windows clients to connect to an AppleShare server (site license for network)
- 4-Sight FAX—lets you send and receive faxes from your desktop (10 user license)
- Now Contact—provides contact management tools (10 user license)
- Now Up•to•Date—handles group scheduling (10 user license)
- Viper Instant-Access—provides a cross-platform information retrieval system (10 user license)

Performance software

- Apple RAID Software—optimizes performance of multiple hard disks through disk striping (RAID 0) (license for server)
- Skyline/Satellite—enables monitoring of the network and server traffic over time (console and monitoring station license)

NOTE: The only software bundled with the 8550/132 Apple Internet Server Solution for the World Wide Web is Apple RAID Software, AppleShare Client for Windows, and the Internet Server Solution CD.

Networking

- Built-in Ethernet with 10Base-T and AAUI
- Two serial ports for LocalTalk
- Supports TCP/IP networking software with Apple Open Transport

Displays

- Supports up to 14-inch Apple displays at millions of colors; 16- and 17-inch Apple displays at up to millions of colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in 2MB VRAM display support

Interfaces

- Three PCI expansion slots

- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- On-board Ethernet using either AAUI-15 or RJ-45
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- Two SCSI DMA buses supporting up to eight SCSI devices and transfers up to 10MB/s (internal bus only)
- 16-bit stereo sound input and output ports
- DB-15 video port for display support

Clock/calendar

- Custom integrated circuit with long-life lithium battery

Disability access

- System software includes CloseView and Easy Access, and can substitute visual cue for beep. Built-in solutions and third-party options provide alternative input and output solutions for people with disabilities.

Keyboard and mouse

- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Electrical requirements

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 225 W maximum, not including display

ADB power requirements

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA; keyboard draws 25 to 80 mA (varies with keyboard model used)

Operating environment

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116.6° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and weight

- Height: 14 in. (35.6 cm)
- Width: 7.7 in. (19.6 cm)
- Depth: 15.75 in. (40.0 cm)
- Weight: 25 lb. (11.3 kg)—varies based on internal devices installed

Regulatory approval

- FCC Class A

Ordering Information

=====

Workgroup Server 8550/132 Applications Server Solution

(24MB/2GB/CD/DAT)

Order No. M4342LL/A

- 512K level 2 cache, 1.4MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3
- Server Solutions CD and other bundled software

Workgroup Server 8550/132 AppleShare Server Solution

(24MB/2GB/CD/DAT)

Order No. M4340LL/A

- Identical to Order No. M4342LL/A, plus AppleShare 4.2.1, Apple Remote Access MultiPort Server software, and Server Manager from Santorini

Workgroup Server 8550/132

(24MB/2GB/CD)

Order No. M4343LL/A

- AppleShare Server Solution without a DAT drive or Retrospect Remote software

Workgroup Server 8550/132 Internet Server Solution for the WWW

(24MB/2GB/CD)

Order No. M4341LL/A

- 512K level 2 cache, 1.4MB Apple SuperDrive floppy disk drive, and mouse
- System software version 7.5.3
- Apple Internet Server Solution CD (WebSTAR; PageMill; license for MacDNS domain name server software; NetCloak; ServerStat; RealAudio; Acrobat Pro; HyperCard; Web connectivity software for your existing EveryWare Butler SQL and FileMaker Pro databases; Navigator; BBEdit; clickable maps, e-mail, and database AppleSearch CGIs; cus-tomizable WWW pages and forms; AppleScript and scripting additions; AppleSearch; Apple RAID; AppleShare Client for Windows). Does not include Workgroup Server Solutions CD, AppleShare 4.2.1, or Server Manager.

Included with all Workgroup Servers:

- Complete setup, learning, and reference documentation
- Limited one-year hardware warranty

Workgroup Server 8550/132 Logic Board Upgrade

Order No. M4607LL/A

- Upgrades a Workgroup Server 80, 8150, or 8150/110 to a Workgroup Server 8550/132
- Includes Apple RAID Software, AppleShare 4.2.1 Update Kit, and System 7.5.3 software. Additional RAM is required

Macintosh Memory Expansion Kits

A variety of memory expansion kits are available. 168-pin DIMMs are required. Check with your Apple reseller for details.

Personal Internet Solution Bundle & Global Village Issue (1/96)

Revised: 1/8/96
Security: Everyone

Personal Internet Solution Bundle & Global Village Issue (1/96)

=====

Article Created: 5 January 1996

TOPIC -----

I received my new Personal Internet Solution Bundle with an external Global Village Gold II modem. How can I use this modem for Faxing with the software provided?

DISCUSSION -----

The Personal Internet Solution Bundle does not include Global Village modem software. The bundle only comes with the CCL, or modem script, for connecting a Global Village Gold II modem with the Internet. Because this modem was to be used with bundled Internet-specific software, the Global Village software was not going to be needed.

If you want to send Faxes, contact Global Village technical support to obtain TelePort/GlobalFax software. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Apple Media Tool 2.0: Description (1/96)

Revised: 1/29/96
Security: Everyone

Apple Media Tool 2.0: Description (1/96)

Article Created: 8 January 1996
Article Reviewed/Updated: 29 January 1996

TOPIC -----

This article describes the features of the Apple Media Tool 2.0.

DISCUSSION -----

With Apple Media Tool software, you can create dynamic multimedia projects for business, education, entertainment, and the home. And you can share them with almost anyone, because finished projects can run on both Macintosh and Windows software-based systems.

The Apple Media Tool makes development of sophisticated multimedia titles easy. Its visual authoring environment lets you assemble graphics, text, sound files, and QuickTime and QuickTime VR movies into exciting, interactive multi-media programs. It's so easy to use, you don't need to write programming code or deal with a complex user interface.

Navigating with the intuitive Browser, you import the media elements you need for each screen, then assign actions that allow users to interact with them. You can create any number of links between different screens, giving users nearly unlimited options for exploring the subject matter. If you like, you can add music or other sounds that will play without interruption as users move from screen to screen.

Apple Media Tool helps you create higher-quality projects because you can focus on content and flow instead of on writing scripts. You can even reuse the structure of a project with different content. You can also assign each part of a project to the person best qualified to create it, then integrate everyone's work into a polished multimedia project.

Previous versions of Apple Media Tool have won numerous accolades, including the 1993 MacUser Editor's Choice Award for Best New Multimedia Software. Version 2.0 brings an enhanced user interface and many other features to this already

popular software.

For complex projects requiring advanced interactive features, Apple also offers the Apple Media Tool Programming Environment (must be purchased separately). Using its object-oriented programming language and application framework, programmers can optimize and extend projects created with the Apple Media Tool.

New features in version 2.0

- Use intuitive Browser for easy project navigation
- Build QuickTime VR movies into projects without scripting
- Enable hypertext linking
- Create flipbook animation from PICT file
- Apply continuous sound throughout a project
- Prioritize first, second, and third run-time bit-depth choices
- Use custom color palettes for each screen
- Record and automate projects with AppleScript
- Customize features and projects with Apple Media Tool Programming Environment (sold separately)
- No licensing fees

Media formats supported

- QuickTime and QuickTime VR movies
- PICT graphics
- SND, AIFF, and WAV sound files
- RTF text files (including hypertext files)

To create a simple interactive multimedia title

- Open new project
- Create and position screens
- Name screens
- Connect screens (thereby creating a project map)

To add new media to a project

- Add a media object (movie, graphic, text, or sound) from Media menu
- Drag and drop media onto project screen

To add interactivity to a project

- Within the Browser, select an object (such as movie, graphic, text, or sound) within a screen
- Select event (such as Mouse down)
- Select desired action (for example Command, Effect, Link) associated with the event
- To test interactivity, select Run in Window menu

To create a cross-platform run-time title

- Save the project as a text file
- Open Runtime Maker

..TIL19170-Apple_Media_Tool_2-0-Description_1-96_(TA34936).pdf

- Check Windows run-time box
- Select and open project file (this simultaneously creates run-time files for both Macintosh and Windows software-based systems)

Features

=====

Ease of use

- Lets you "drag and drop" media objects on to screens
- Displays a map of all project screens and the links between them
- Allows you to assign interactive actions (such as responses to mouse clicks) through simple menu choices
- Lets you integrate QuickTime VR movies without scripting

Support for multiple technologies

- Enables you to deliver the same multimedia content for both Mac OS-based and Windows software-based systems
- Supports popular sound, graphics, text, and video formats (including QuickTime VR)
- Works with AppleScript to automate parts of a project and create links to other applications
- Lets you use hypertext to link keywords to other media objects

Efficiency

- Allows creative team members to work simultaneously on various aspects of the same project, reducing overall production time
- Stores media separately from the application, facilitating easy content substitution and reducing application size
- Features an intuitive user interface and Browser that let you create projects quickly
- Runs completed projects faster than many other multimedia tools

Extensibility with Apple Media Tool Programming Environment

- Allows programmers to customize Apple Media Tool features and optimize Apple Media Tool projects
- Supports extensions to the Internet and interactive television
- Supports extensions for database access and links to other programs

Ordering Information

=====

Apple Media Tool

Order No. 412000Z

- One CD-ROM containing the following software:
 - Apple Media Tool
 - Runtime Maker
 - QuickTime
 - QuickTime for Windows

- Getting Started guide
- Apple Media Tool User's Guide

For more information or to order Apple Media Tool, call Claris at 1-800-544-8554 in the U.S. or 1-800-361-6075 in Canada. In other countries contact your Apple or Claris representative.

The Apple Media Tool Programming Environment is sold separately and available through the Apple Developer Catalog. Also available is an Apple Media Tool Demo CD that includes a limited version of the Apple Media Tool, several sample projects, and electronic documentation (including source-code samples) for the Apple Media Tool Programming Environment.

To order the Programming Environment or the Demo CD, call 1-800-282-2732 in the U.S., 1-800-637-0029 in Canada, or 1-716-871-6555 from other countries. You can also send a fax message to 1-716-871-6511. Site licensing for Apple Media Tool software is available. Please contact Claris for details.

Product specifications are subject to change. Check with your Claris reseller for the most current information about product specifications and configurations.

Claris Corporation is a wholly owned subsidiary of Apple Computer, Inc.

Security: Everyone

Apple Media Tool 2.0: Specifications (1/96)

Article Created: 8 January 1996

TOPIC -----

This article provides the specifications for the Apple Media Tool 2.0.

DISCUSSION -----

New features in version 2.0

- Use intuitive Browser for easy project navigation
- Build QuickTime VR movies into projects without scripting
- Enable hypertext linking
- Create flipbook animation from PICT file
- Apply continuous sound throughout a project
- Prioritize first, second, and third run-time bit-depth choices
- Use custom color palettes for each screen
- Record and automate projects with AppleScript
- Customize features and projects with Apple Media Tool Programming Environment (sold separately)
- No licensing fees

Media formats supported

- QuickTime and QuickTime VR movies
- PICT graphics
- SND, AIFF, and WAV sound files
- RTF text files (including hypertext files)

System requirements

- To develop Apple Media Tool titles, you will need:
 - A Macintosh system with a 68030 or later processor, or a Power Macintosh system

- 8MB of total RAM (12MB recommended)
 - 5MB of available RAM (8MB recommended)
 - A hard disk drive with at least 10MB of available space
 - A CD-ROM drive
 - A display (color recommended)
 - System software version 7.1 or later
 - QuickTime 2.1 or later software
- To play Apple Media Tool titles on a Macintosh system, you will need*:
- A Macintosh system with a 68020 or later processor, or a Power Macintosh system
 - 2MB of available RAM
 - A hard disk
 - System software version 7.1 or later
 - QuickTime 2.1 or later software
- To play Apple Media Tool titles on a Windows software-based system, you will need*:
- A computer with an 80386 or later processor
 - 2MB of available RAM
 - Graphics and sound support
 - Windows 95 or Windows 3.1 software
 - QuickTime for Windows 2.0.3 or later software

* System requirements for playback systems can vary considerably depending on the specific Apple Media Tool project file being played.

PwrBk 5300 & 190: GSM & Nokia Cellular Phone Card Issue (1/96)

Revised: 1/18/96
Security: Everyone

PwrBk 5300 & 190: GSM & Nokia Cellular Phone Card Issue (1/96)

Article Created: 8 January 1996
Article Reviewed/Updated: 18 January 1996

TOPIC -----

I live in New Zealand and I am having trouble sending and receiving faxes using my cellular phone with my PowerBook 5300 series computer. I am using a Nokia DTP-2 PC Card. Are you aware of any issues in using the Groupe Speciale Mobile (GSM) Connection kit with Macintosh PowerBook 5300 series computers, particularly with faxing?

DISCUSSION -----

Issue
=====

Yes, there is an issue involving using the GSM Connection kit 1.1 and Nokia phone with a PowerBook 190 or 5300 series computer. There is a local hardware flow control problem in the PC Card driver, an extension that comes with the PowerBook 190 and 5300 series system software. Since the default setting of the GSM connection is hardware flow control the fax breaks after sending a small amount of data.

Note: Installing the Apple Telecom Software 2.3 does not fix this issue.

Background
=====

The basis of this issue is that New Zealand uses a different type of cellular phone system than is used in the United States. New Zealand uses both Advanced Mobile Phone Service (AMPS) cellular (analog) and Groupe Speciale Mobile (GSM) cellular (Digital).

Digital GSM is not widely used yet in the United States, but it is in New Zealand, Asia, Australia, Europe, and South Africa. GSM is now known as Global System for Mobile Communications which is a set of standards specifying the

infrastructure for a digital cellular service. AMPS is essentially synonymous with analog cellular radio.

Apple R&D in France wrote the "GSM Connection Kit for Macintosh," the part number is either M4130Z/A or M3925Z/B. Version is 1.1 works fully with the PowerBook 500 series computers, but is not entirely functional with the PowerBook 190 or 5300 series computers. It does not work sending or receiving faxes with the PowerBook 190 or 5300 series computers.

Resolution
=====

A new version of the GSM Connection Kit version 1.2 (part number M3925Z/C) has been written to solve the issue with using GSM on a PowerBook 5300 or 190 series computer. The 1.2 version has been released especially to allow faxing capabilities on PowerBook 5300 and 190 series computers. It corrects a regression within the PC Card driver installed on these computers. In previous versions, instead of returning an alert it just crashed the system. The fix has been implemented in version 1.2 of the PCMCIA GSM extension which contains the fax components.

Macintosh Performa: Editing Received Faxes (1/96)

Revised: 1/8/96
Security: Everyone

Macintosh Performa: Editing Received Faxes (1/96)

=====

Article Created: 8 January 1996

TOPIC -----

I am using the Global Village software that was included with my Macintosh Performa computer to receive faxes. However, I am not sure how to edit them once I receive them. How can I do this?

DISCUSSION -----

Saved faxes are stored as PICT documents, which are pictures containing a bitmap of the received fax. Although you may see letters and words when you view the fax, you are really just seeing a picture of a collection of dots. You cannot edit a PICT document using a word processing program. Instead, you must edit the fax as you would a picture or other graphic.

If you use the Global Village Fax Center to save the fax, you can modify the fax using a graphic application, such as the paint module in ClarisWorks, Microsoft Works, or WordPerfect Works.

Additionally, you could purchase optical character recognition (OCR) software which could convert an incoming fax into text, which you could then edit in a word processing application. Contact Global Village for additional information about OCR software.

PowerBook 190 & 5300: Third-Party Video Cards (1/96)

Revised: 1/8/96
Security: Everyone

PowerBook 190 & 5300: Third-Party Video Cards (1/96)

=====

Article Created: 8 January 1996

TOPIC -----

Has any third-party company released or is going to release a video upgrade option for the Powerbook 5300 and/or Powerbook 190 to support 16 bit video out capabilities?

DISCUSSION -----

We know of two companies that currently have these types of products or have announced that they will in the near future. Focus Enhancements, Inc. has a video card upgrade for the PowerBook 5300 series computers. Newer Technology is planning on releasing a video card in December 1995.

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendors for additional information.

Color LaserWriter 12/600 PS: Color Files Won't Print Gray 10/96

Revised: 10/23/96
Security: Everyone

Color LaserWriter 12/600 PS: Color Files Won't Print Gray 10/96

Article Created: 8 January 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

Is there any way to print a color image in grayscale on an Apple Color LaserWriter 12/600 PS? My only options in the dialog box are Black and White, or Color/Grayscale. Even if I select Black and White, the image prints in color.

DISCUSSION -----

There is no way to print a color image in grayscale on the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printer if the image is an Encapsulated PostScript (EPS) file, or the application you are printing from generates its own PostScript.

Applications like Adobe Illustrator and Aldus Freehand generate their own PostScript, therefore if any color is used in the document, the application generates calls to PostScript color operators. When the document is sent to the printer, the driver recognizes the data is already PostScript and forwards it to the printer unchanged. Thus, the printer driver is never used to generate the PostScript and driver settings such as Black & White are bypassed. The Color LaserWriter 12/600 PS printer directly executes the PostScript coming into the input stream and since it encounters a color operator, prints the document in color.

This article was published in the "Information Alley":
Volume II, Issue 19, Page 12

Article Change History:

23 Oct 1996 - Added Color LaserWriter 12/660 PS to the discussion.
30 Jan 1996 - Added Information Alley information.
16 Jan 1996 - Added information on why it will not print grayscale.

Power Macintosh 7500 & 8500: Frequently Asked Questions (5/96)

Revised: 5/17/96
Security: Everyone

Power Macintosh 7500 & 8500: Frequently Asked Questions (5/96)

Article Created: 8 January 1996
Article Reviewed/Updated: 16 May 1996

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Power Macintosh 7500 and 8500 series computers.

Questions answered in this FAQ:

-
- 1) Does my Power Macintosh have an FPU (Floating Point Unit/Math coprocessor)? I see errors that an FPU is not installed.
 - 2) What causes Type 10 and 11 errors?
 - 3) I need to run DOS software on my Power Macintosh 7500 or 8500 series computer. What are my options?
 - 4) I have an old program which tells me to turn off 32-bit addressing. But I do not see this as an option in my Memory control panel. Why?
 - 5) How can I get the built-in Ethernet address for my computer?
 - 6) Can I add level-2 processor cache to my computer? Is it a SIMM or DIMM?
 - 7) Can I add Video RAM (VRAM) to my computer?
 - 8) I have an old program that requires less than 256 colors to be on. But the Monitors control panel settings don't show anything less than 256. What can I do?
 - 9) At startup time, my monitor flashes off and back on again. Why?
 - 10) I have a GeoPort Telecom Adapter. What version of the Apple Telecom software should I use?

11) I can't see a restart button on the computer. What do I use to restart my Power Macintosh 7500 or 8500 if the screen is frozen?

12) I am trying to connect to my internet service provider (ISP) using SLIP/PPP software. What do I need to know?

13) I am trying to get the Video Player software that comes with my Power Macintosh 8500 to work. When I launch it, a message appears:

"Apple Video Player could not find the necessary video hardware. Make sure that your computer has video input capabilities and that you are not running any other video applications."

14) Can NuBus cards be used with these Power Macintosh computers?

DISCUSSION -----

1) Question: Does my Power Macintosh have an FPU (Floating Point Unit/Math coprocessor)? I see errors that an FPU is not installed.

Answer: All PowerPC processor chips, which all Power Macintosh computers use, have an integrated FPU. You may be seeing the "FPU not installed" error for two reasons:

- You are running "conventional" software in 68K emulation. This operating mode does not provide access to the computer's floating point unit. Thus, the program does not work. See if there is an upgrade to a PowerPC native version of the program. Certain software "bridges" exist to allow conventional software access to the PowerPC microprocessor's FPU. See the Redgate Communications area to search for such products.

- You are using software, in either emulation or native mode, which is simply failing. Since the PowerPC supports pipelining instructions, a number of errors are occurring simultaneously. They eventually percolate out as an "FPU not installed" error. An error did occur, but it has nothing whatsoever to do with the need for a floating point unit. You should apply standard troubleshooting steps to resolve this issue. Standard troubleshooting information can be found in the online Apple Tech Info Library.

2) Question: What causes Type 10 and 11 errors?

Answer: Answer: A Type 10 error seen on a Power Macintosh 7500 or 8500 series computer is going to occur under the same circumstances as an FPU error. Due to the changes and enhancements in the 680x0 emulator, there are instances where an FPU error will be returned as a type 10 error. Follow the same troubleshooting steps you would when troubleshooting an FPU error.

Type 11 errors are typically due to one of a variety of factors:

- Font problems: you are using a bad font.
- Incompatible software running in emulation.

- SCSI chain problems: bad driver or cable.
- Cache SIMM problems (if you have installed one on your Power Macintosh computer).
- RAM problems: bad RAM has been installed.

For steps on how to troubleshoot such problems, see the referenced article in the online Apple Technical Info Library (on Compuserve and the World Wide Web)

- Use the search string "type 11 power" to locate the article "Power Macintosh: Meaning of Error Type 11."
- Use the search string "sys7 extension troubleshoot" to locate the article "Troubleshooting Macintosh System 7 INIT Conflicts"

3) Question: I need to run DOS software on my Power Macintosh 7500 or 8500 series computer. What are my options?

Answer: With a Power Macintosh 7500 or 8500 series computer, there are several ways to accomplish this.

- Apple offers two PC Compatibility cards featuring either a Pentium 100-megahertz processor on a 12-inch card (M4092LL/A) or a 586 100-megahertz processor on a 7-inch card (M4091LL/A). These PC Compatibility Cards let you run MS-DOS and Windows applications directly on your Power Macintosh computer. You can switch instantly between Mac OS, Windows, and MS-DOS environments with a single keystroke.

- Orange Micro has announced a version of their Orange PC card for PCI based Power Macintosh computers. The Orange PC cards use an expansion slot inside of your Power Macintosh 7500 or 8500 series computer. You can get more information by contacting Orange Micro directly. Their phone number is 714-779-2772.

- Reply, Inc. has also announced a version of their DOS on Mac card for PCI based Power Macintosh computers. The Reply cards use an expansion slot inside of your Power Macintosh 7500 or 8500 series computer. You can get more information by contacting Reply directly. Their phone number is 800-801-6898.

- You can use Insignia Solutions' SoftWindows emulator. This is a Macintosh application which emulates a PC DOS/Windows environment. You can get more information, such as pricing, performance, system requirements, and compatibility information from Insignia by calling them at 800-848-7677.

4) Question: I have an old program which tells me to turn off 32-bit addressing. But I do not see this as an option in my Memory control panel. Why?

Answer: All Power Macintosh computers run only in 32-bit memory addressing mode. There is no way to turn this off. Check with the vendor for a 32-bit compatible version of the software.

5) Question: How can I get the built-in Ethernet address for my computer?

Answer: The Apple LAN Utility version 1.0b4e1 can obtain the built-in Ethernet address for the Power Macintosh 7500 and 8500 series computers. While this utility is not supported by Apple, it is available in the Apple Software Updates area of the online services we post to (pathname: Macintosh -> Unsupported -> Apple LAN Utility 1.0b4e1)

6) Question: Can I add level-2 processor cache to my computer? Is it a SIMM or DIMM?

Answer: You can add a level-2 processor cache to the Power Macintosh 7500 or 8500 series computers. The cache is a 160 pin DIMM (dual in-line memory module), 11ns. Apple currently sells a 256K level-2 cache card for use in the Power Macintosh 7500 series computer (The Power Macintosh 8500 series computer features a standard 256K cache):
M3808LL/A 256K L2 cache (for Power Mac 7200 and 7500 series).
Check with third-party vendors for compatible cache cards that they may offer.

7) Question: Can I add Video RAM (VRAM) to my computer?

Answer: You can increase your VRAM to 2 MB or 4 MB from the 2 MB it originally shipped with. The VRAM DIMMs must be 1 MB, 112-pin fast-paged mode, with 70ns RAM access time or faster. Do not use 256K VRAM SIMMs.

8) Question: I have an old program that requires less than 256 colors to be on. But the Monitors control panel settings don't show anything less than 256. What can I do?

Answer: The built in video will not support less than 256 colors or greys. If you have a program that requires black and white, 4, or 16 colors to run, then you will not be able to run these programs. Check with the software vendor for availability of a compatible version. You could also check with video card vendors to see if any offer support for less than 256 colors.

9) Question: At startup time, my monitor flashes off and back on again. Why?

Answer: The software video driver for the monitor is loading up. This is normal and is answered in the Power Macintosh 7500/8500 Read Me file.

10) Question: I have a GeoPort Telecom Adapter. What version of the Apple Telecom software should I use?

Answer: You should use at least the Apple Telecom 2.1 that is in the Apple Telecom folder inside of the Apple Extras folder on your hard drive (and on your backup CD if you have removed it). Megaphone 1.0.2 is also provided in this folder. The current Apple Telecom 2.3 is compatible, but adds no additional functionality for the Power Macintosh 7500 or 8500 series computers.

11) Question: I cannot see a restart button on the computer. What do I use to restart my Power Macintosh 7500 or 8500 if the screen is frozen?

Answer: The reset command is a keyboard shortcut identical to the Macintosh Quadra 605 and Macintosh LC computers. The key combination is Command-Control-Power. In addition to the keyboard power button, the Power Macintosh 7500 and 8500 series computers also have a power button on the bottom front left panel (below the speaker panel).

If these do not restart or shut down the computer, it may be necessary to disconnect the power from your Macintosh computer. This can be done by turning off the power strip or by disconnecting the cable from the outlet or the back of the computer.

12) Question: I am trying to connect to my internet service provider (ISP) using SLIP/PPP software. What do I need to know?

Answer: Check the Open Transport FAQ for more detailed information. Make sure you have at least Open Transport 1.0.7 (1.0.6 is what originally came with your Power Macintosh 7500 or 8500 series computer). Version 1.0.8 is the current version. Both are available in the Apple Software Updates area on the online services to which Apple posts its software.

Also make sure you are using the TCP/IP control panel and not trying to get MacTCP to work. MacTCP is not compatible with the Power Macintosh 7500 or 8500 series computers.

13) Question: I am trying to get the Video Player software that comes with my Power Macintosh 8500 to work. When I launch it, a message appears:

"Apple Video Player could not find the necessary video hardware. Make sure that your computer has video input capabilities and that you are not running any other video applications."

Everything is correctly connected. I just installed Adobe Premiere and I am having problems with it also. This is the first time I have tried the Video Player application. I even made sure that QuickTime and QuickTime PowerPlug were turned on in the Extensions Manager.

What steps do I need to take to use my Apple Video Player software?

Answer: Apple Video Player 1.3 comes preinstalled on the Power Macintosh 7500 and 8500 series computers. There are two things that may cause this error message to appear on a Power Macintosh 7500, or 8500.

QuickTime 2.0.9 Not Installed

Apple Video Player requires QuickTime 2.0.9 or later and QuickTime PowerPlug 2.0.9 or later to run.

During the installation of a multimedia application, such as Adobe Premiere, the preinstalled versions of the QuickTime extensions may have been replaced with earlier versions. Many games and multimedia CD-ROM discs will install QuickTime software into your System Folder. Make sure your extension folder contains version 2.0.9 or later of the QuickTime extensions by following these steps:

Step 1

Open the Extensions folder in your System Folder on your hard drive.

Step 2

Locate QuickTime and QuickTime PowerPlug in your Extensions folder and click once on each while holding the down the shift key on your keyboard.

Step 3

Under the File menu, choose Get Info. Confirm that the version number is 2.0.9 or 2.1. If it is not, drag the two extensions to the trash and reinstall your multimedia software using the Custom install feature of the Macintosh CD that came with your computer.

QuickTime 2.1 and MoviePlayer 2.1 are available from online services.

Plaintalk Speech Recognition Turned On

If you have recently installed Plaintalk Speech Recognition software on your computer, this error will appear if you have Speakable Items turned on and then launch Apple Video Player.

Conversely, if you have Apple Video Player running and you try to turn Speakable Items on in the Speech Setup Control Panel, a message appears stating "Speakable items could not run because an unexpected error occurred. Restarting your computer or reinstalling the Speech Recognition software may correct this problem."

Because both applications need to access the digitizing hardware, you cannot use Apple Video Player and Speech Recognition simultaneously on the Power Macintosh 7500 or 8500. Engineering is aware of this issue and plans to update the error message to be more descriptive in subsequent releases of the Apple Video Player.

These articles can help you locate the QuickTime software update mentioned here:

14) Question: Can NuBus cards be used with these Power Macintosh computers?

Answer: NuBus cards cannot be used in this Power Macintosh. However, to preserve your investment in NuBus technology, a NuBus expansion chassis for PCI will be available from Second Wave, Inc. This chassis will enable you to continue to use your existing NuBus cards in Power Macintosh systems with PCI slots.

Macintosh Performa 6290CD: Specifications (4/97)

Revised: 5/1/97
Security: Everyone

Macintosh Performa 6290CD: Specifications (4/97)

Article Created: 8 January 1996
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides technical specifications for the Macintosh Performa 6290CD.

Note: The Macintosh Performa 6290CD is similar to the Macintosh Performa 6300CD, but it differs in both the memory configuration and the software bundle.

DISCUSSION -----

Hardware
=====

Microprocessor

- PowerPC 603e processor running at 100 MHz
- Integrated floating-point unit
- 40 MHz, 64-bit bus
- 256K Level 2 cache
- 32K internal cache

Memory

- Comes with 8 MB of RAM (uses one SIMM socket)
- Can be expandable to 64MB of RAM using two 32 MB SIMMs
- Uses 72-pin, noncomposite, 80-nanosecond or faster DRAM SIMMs

Storage

- Internal 1.2 GB hard disk drive
- Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS

disks

- Internal, quadruple-speed AppleCD 600i CD-ROM drive

Modem

- Global Village 28.8 kbps fax modem
- Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Monitor (Apple Multiple Scan 14 Display)

- Comes standard with an Apple 14-inch RGB color display (12.4-inch diagonal viewable image size)
- 0.28-mm dot pitch
- Non-Interlaced
- Tilt-and-swivel base
- Shadow mask picture tube
- Multiple Scan
- Stereo speakers
- Meets the strictest international magnetic-field emissions requirements (SWEDAC MPR II)

Display Support

- Apple displays up to 15 inches through a 1 MB DRAM video buffer (independent of system RAM)
- Wide range of VGA and SVGA displays from other vendors

Colors and Resolutions

Begin_Table

Resolution	Max. Bit Depth	Max. Number of Colors
-----	-----	-----
640 x 480	16	32,768
800 x 600	8	256
832 x 624	8	256

End_Table

Interfaces

- Apple Desktop Bus port for mouse, keyboard, and other devices
- Monitor port (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- Serial port (RS-232/RS-422) for an AppleTalk network connection, other networking or communications equipment, or a printer
- SCSI interface port for connecting as many as five external SCSI devices, such as disk drives or CD-ROM drives
- LC processor-direct expansion slot
 - Compatible with most Macintosh Performa 400 and 500 series; Performa 630; Macintosh Quadra 605; and Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630 processor-direct cards

- Can be used for an Apple MPEG Media System card or other specialized card
- Communications slot for a 28.8-kbps fax/data/voice modem (used by Global Village modem)
- Video slot for optional Apple Video System (NTSC, PAL, and SECAM video input)
- Dedicated connector and infrared remote receiver for optional internal Apple TV/Video System (provides TV tuner and video input)

Sound

- Stereo 16-bit sound
- Built-in speaker
- Sound-output port
- Sound-input port (can be used to connect the Apple PlainTalk microphone included with the computer)
- Front headphone jack and volume control

Communications

- Global Village 28.8-kbps fax/data/voice/modem
- Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)
- Megaphone software lets users turn their Macintosh Performa 6300CD into a speakerphone and digital answering Machine; included fax software allows users to send and receive fax communications

Keyboard

- Provides adjustable keyboard slope
- Includes function keys, numeric keypad, cursor arrow keys, and special screen-editing keys

Mouse

- Round shape fits contour of the palm of the hand
- Large button allows easy clicking and dragging

Electrical Requirements

=====

Main Unit

- Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- Frequency: 50 to 60 Hz
- Power: 55 W maximum

Monitor

- Line voltage: 90-132, 198-260 V
- Frequency: 47-63 Hz
- Power: 90 W maximum

Size and Weight

=====

Main Unit

- Height: 4.3 in. (10.95 cm)
- Width: 12.6 in. (32.0 cm)
- Depth: 16.5 in. (41.9 cm)
- Weight: 19 lb. (8.6 kg)

Monitor

- Height: 16.7 in. (42.4 cm)
- Width: 15.9 in. (40.5 cm)
- Depth: 17.8 in. (45.2 cm)
- Weight: 31.0 lb. (14 kg)

Operating Environment

=====

Main Unit

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 5% to 95%, noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Monitor

- Operating temperature: 10 to 40 degrees C (50 to 104 degrees F)
- Storage temperature: 0 to 60 degrees C (32 to 140 degrees F)
- Relative humidity: 20% to 95%
- Maximum altitude: 10,000 ft. (3000 m)

Bundled Software

=====

System Software

- Mac OS 7.5.1 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, and Macintosh PC Exchange software

Disability Access

- CloseView software magnifies image up to 16 times
- Easy Access software for sequential combination keys, and cursor control from the numeric keypad
- "Visual beep" replaces audible system alerts

Pre-installed software

- Acrobat Reader
- The American Heritage Dictionary
- At Ease
- ClarisWorks
- ClickArt Performa Collection
- Connectix Desktop Utilities
- Eric's Solitaire Sample
- Espresso
- Global Fax
- Global Fax Tour
- Lode Runner
- MacGALLERY Clip Art Treasure Pak
- MacLinkPlus/Easy Open Translators
- Megaphone
- Megaphone Tour
- Quicken
- WealthBuilder
- The Writing Center
- Zoop

CD-ROM titles

- Grolier Multimedia Encyclopedia
- TIME Almanac Reference Edition
- 3D Atlas
- The Family Doctor
- Smithsonian's America
- Jump Start 1st Grade
- Making Music by Voyager
- My First Incredible, Amazing Dictionary

PCI-Based Power Macintosh: LAT Compatibility (1/96)

Revised: 1/8/96
Security: Everyone

PCI-Based Power Macintosh: LAT Compatibility (1/96)

Article Created: 8 January 1996

TOPIC -----

This article describes an update on the status of LAT compatibility with the PCI-based Power Macintosh computers, the 7200, 7500, 8500, and 9500.

DISCUSSION -----

There have been reports of compatibility problems with the PCI-based Power Macintosh computers and LAT that were initially believed to be related to Open Transport. Further investigation by the Open Transport team and DEC's PATHWORKS team has revealed there was an obscure bug between LAT and the Time Manager that manifested itself on some of these new computers. Open Transport was not the reason LAT did not function properly. The problem has been resolved in an update of LAT available from Digital.

For PCI-based Power Macintosh computers with Open Transport you must have Open Transport v1.0.6 or later. With this setup, most of PATHWORKS works properly, including DECnet. The problem was with LAT.

Do not use Easy Install for PATHWORKS v1.3; perform a Custom Install, and deselect MacTCP and LAT. If you have included them by mistake, they can remove after restarting your Macintosh. DO NOT open the LAT Tool or LAT control panel before removal. LAT v1.3 crashes PCI-based Power Macintosh computers, and these computers come with Open Transport TCP/IP, so MacTCP is not needed and should not be installed.

For LAT functionality, you need to update to LAT v1.3.1, which comes from Digital. LAT v1.3.1 also requires Open Transport v1.0.6 or greater.

PowerBook 190 & 5300: HD Target Mode Or SCSI Disk Mode (1/96)

Revised: 1/8/96
Security: Everyone

PowerBook 190 & 5300: HD Target Mode Or SCSI Disk Mode (1/96)

=====

Article Created: 8 January 1996

TOPIC -----

The Powerbook 5300 and 190 series computers have HD Target Mode and not SCSI Disk Mode. What is the difference?

DISCUSSION -----

The Powerbook 5300 and 190 series computers do not have internal SCSI hard drives, but instead have IDE internal hard drives. Therefore it would not be correct to call it SCSI Disk Mode. Although, the operation is the same.

PowerBook 5300 System Update: Frequently Asked Questions (2/97)

Revised: 2/6/97
Security: Everyone

PowerBook 5300 System Update: Frequently Asked Questions (2/97)

Article Created: 9 January 1996
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article answers the following frequently asked questions (FAQ) about the PowerBook 5300 System Software Update.

- 1) What is the PowerBook 5300 System Software Update?
- 2) What changes and Enhancements were made?
- 3) Who Needs To Install This Software?
- 4) Who Does NOT Need To Install This Software?
- 5) How Can I Tell If I Already Have The New Software?
- 6) Which Computers Can Utilize This Software Update?
- 7) How should I install the PowerBook 5300 software update?
- 8) Do I need all the disks that are posted online?
- 9) Where and how can I get the PowerBook 5300 software update?
- 10) On what date was the PowerBook 5300 Software Update made available?

DISCUSSION -----

- 1) Question: What is the powerbook 5300 System Software Update?

Answer: The PowerBook 5300 System Software Update offers better system performance for the PowerPC microprocessor. It is a revision to the system software which shipped with early model Macintosh PowerBook 5300 and 190 series

computers. By making this system update available to customers free of charge, Apple is demonstrating its commitment to promoting the highest level of system software reliability.

2) Question: What changes and enhancements were made?

Answer: Several significant improvements were made:

- Improved emulator performance
- Integration of Finder 7.5.4 which optimizes caching to improve performance
- Native resource updates to improve system level performance
- An improved PC Card modem extension for faxing and an improved application launch process which increases the launch speed of applications including Microsoft Word and Excel

3) Question: Who needs to install this software?

Answer: This software update is only useful for Macintosh PowerBook 5300 and 190 series computer owners who purchased their computers prior to mid-January 1996.

4) Question: Who does not need to install this software?

Answer: The software included in this PowerBook System Software Update is already pre-installed on every PowerBook shipped since mid-January, including the PowerBook 5300, 2300 and 190 series, as well as the PowerBook 500 PowerPC upgrade and PowerBook Duo PowerPC Upgrade.

These new disk images can only provide system software installation for the PowerBooks mentioned above. You cannot install this software on any other PowerBook computers.

5) Question: How can I tell if I already have the new software?

Answer: You can tell the difference between the most recent system software and earlier versions by checking the system enabler version in the "About This Macintosh..." Window. Any customer with a system enabler version earlier than 1.2 could benefit from this update.

6) Question: Which computers can utilize this software update?

Answer: The following Macintosh Products can utilize this system software:

- Macintosh PowerBook 5300 Series Computers
- Macintosh PowerBook 190 Series Computers

- Macintosh PowerBook 2300 Series Computers
- Macintosh Computers with the PowerPC Logic Board Upgrade for the PowerBook 500 Series
- Macintosh Computers with the PowerPC Logic Board Upgrade for the PowerBook Duo Products

7) Question: How should I install the PowerBook 5300 software update?

Answer: Apple strongly recommends that you do a "clean" installation to update the system software for your PowerBook computer. You can initiate this procedure by pressing the Command-Shift-K keys at the main window of the Installer. Then select the option to "Install New System Folder", then click OK.

After the computer has restarted, move the following items from the Previous System Folder to the same location in the System Folder:

ATM Font Database
Claris folder
DataViz folder
Launcher Items folder
MacLinkPlus Setup (in the Control Panels folder)
MacLinkPlus for Easy Open (in the Extensions folder)

Note: Some of these items may not be present on your particular PowerBook computer model.

For more information, also see "Reinstalling System Software" in the chapter on diagnostic techniques in the manual that came with your PowerBook computer.

8) Question: Do I need all the disks that are posted online?

Answer: No, if you still have the disk images that were originally included on your PowerBook computer's hard drive when it was purchased, you only need to download and decompress disk images 1,8,10,11,12 and 13.

The complete set is 14 disks, #1-13 system install, #14 is Disk Tools.

9) Question: Where and how can I get the PowerBook 5300 software update?

Answer: You can get the PowerBook 5300 software update using one of the following methods:

- The following Apple SW Updates area on the Internet:
ftp://ftp.info.apple.com/Apple_Support_Area/Apple_SW_Updates/US/Macintosh/PowerBook/PB_5300_SW_Update/
- Apple provides a choice of CD-ROM or Floppy disk set at no charge to

customers via 1-800-273-4035 fulfillment line.

- Contact 800-SOS-APPL, the phone tree will allow customers to route themselves to obtain the update or callers can be transferred to the fulfillment group by SOS-APPL agents.
- Available to Apple's System 7.5 Volume License Maintenance customers through their standard fulfillment process. The license agreement and instructions are available at <http://www.macos.apple.com/pbupdate.7.5.2>

10) Question: On what date was the PowerBook 5300 Software Update made available?

Answer: It was made available on January 9, 1996.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:

06 Feb 1997 - Updated to current ftp locations.

02 Jul 1996 - Added Fax Doc word

15 Feb 1996 - Gave more detailed explanation for how to install.

Using TCP/IP to Access a Remote AppleTalk Network (1/96)

Revised: 1/9/96
Security: Everyone

Using TCP/IP to Access a Remote AppleTalk Network (1/96)

=====

Article Created: 9 January 1996

TOPIC -----

Is it possible to use a TCP/IP network to connect to an Apple Remote Access (ARA) Server and have the access to the server I would have if I dialed the ARA Server direct?

I have a dial up, modem-based PPP connection to a local internet service provider (ISP), and I want to access an ARA server in another state. The server has a dedicated Internet connection and it's own unique IP address and domain name. One solution, of course, is to dial up the server, but that is an expensive call. What I want to do is use my PPP-TCP/IP connection so that I can establish a TCP/IP connection to an ARA server and then use ARA to access the remote AppleTalk network to mount a shared volume on my desktop.

DISCUSSION -----

There is a product that can do what you want, but it's not ARA. The product was developed at the University of Melbourne in Australia and can be downloaded from the Internet with ftp from the following address:

[munnari.oz.au](ftp://munnari.oz.au)

Look in the mac directory for ARNS (A Remote Network Server). We do not believe there are any commercial products that are in its class of functionality.

The client software can run on any Macintosh with classic networking, that is MacTCP. A new icon, IP Remote, appears in the Network control panel, for example like EtherTalk & Remote Only. Clicking on IP Remote presents a login dialog to appear requesting the IP address of the ARNS server, your user name and password. ARNS is being updated to work with Open Transport but is not compatible yet.

The server software can run on a Macintosh, or a UNIX workstation. Refer to the ftp site for more server information.

ARNS is like ARA in remote only mode, where your Macintosh is either on a local AppleTalk network or a remote AppleTalk network. Your computer cannot be on both AppleTalk networks simultaneously.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

MacDNS 1.0: Importing Existing BIND Zones (3/96)

Revised: 3/29/96
Security: Everyone

MacDNS 1.0: Importing Existing BIND Zones (3/96)

Article Created: 9 January 1996
Article Reviewed/Updated: 29 March 1996

TOPIC -----

Is it possible to import existing BIND files containing DNS information for my zone, rather than having to input the host and IP address data by hand?

DISCUSSION -----

MacDNS supports importing existing BIND files, although there are a few issues associated in doing this. Here are the steps to follow:

Step 1

After downloading the appropriate resource database files for a particular zone with ftp from a UNIX DNS server, be sure that the file is saved in generic text format.

Step 2

Edit the downloaded text file, be sure the Start of Authority (SOA) resource record is at the beginning of the file.

IMPORTANT: Do not have comments (";") or \$ORIGIN listed at the top of the file.

Begin_Table

Below is an example of a proper SOA resource record:

```
company.com.  IN SOA  host.company.com.  root.host.company.com. (
    19950927  ; serial number
    21600    ; secondaries refresh (6 hours)
    3600     ; secondaries retry (1 hour)
    3600000  ; secondaries expire (41 days)
    108000 ) ; minimum default TTL (30 hours)
```

Once edited, save the file again as text.
End_Table

Step 3

With MacDNS active, choose Message Log from the Window Menu and set the Log Threshold to Microscopic. This will assist in debugging if a problem occurs importing the file.

Step 4

Choose Open Zone File from the File menu, to open the SOA resource record file. MacDNS will import the resources. If at any point MacDNS does not import successfully, check the Message log for help in determining the failure point.

Step 5

Once imported, choose Set Zone Information from the Hosts menu and verify that the information is correct.

At this point, MacDNS is the primary name server for that zone. The PTR Records are internally created by MacDNS.

Power Macintosh 8500: Noise in Audio Recording (1/96)

Revised: 1/30/96
Security: Everyone

Power Macintosh 8500: Noise in Audio Recording (1/96)

=====

Article Created: 9 January 1996
Article Reviewed/Updated: 30 January 1996

TOPIC -----

I was recording from a cassette deck to my Power Macintosh 8500 series computer. I had the RCA jacks from the cassette deck connected to the computer's RCA audio input jacks, and I noticed that there was a humming noise in the recording. How can I avoid this noise in future recordings?

DISCUSSION -----

When connecting external audio devices (such as a CD-ROM player, cassette deck, mixing boards, and so on) to the RCA audio input jacks on the Power Macintosh 8500 computer, you may create a ground loop between the audio device and the computer.

A ground loop occurs when you connect two devices together with different ground points. Both devices must have the three-prong plug for this to happen. To avoid ground loops, many consumer electronics only have two-prong plugs.

The loop most commonly goes from one device to the other along the audio cables and then returns through the ground wire. The difference in potential between the two grounds in the ground loop results in an audible noise or hum.

To eliminate this noise, disconnect the audio device from the computer. If the noise disappears, plug the power cords from the computer and the other devices into the same power strip. This places all of the equipment at the same ground potential and eliminates the loop.

Mac Access Passport Database
=====

Mac Access Passport (MAP) is a database that includes descriptive information about more than 100 Macintosh solutions for individuals with disabilities. Each record in MAP contains a product description and developer contact information.

MAP includes information on tools for individuals with physical motor impairments, blindness, hearing and speech difficulties, and learning disabilities. The database can be searched by keywords, product name, developer name, disability type, and description text. MAP is based on the Macintosh FileMaker Pro search engine by Claris Corporation.

You can view the Mac Access Passport on the WWW at <http://www2.apple.com/disability/welcome.html>. You can download the Mac Access Passport database from [ftp.info.apple.com](ftp://ftp.info.apple.com) or [ftp.apple.com](ftp://ftp.apple.com). Or you can request a copy by calling Apple's Worldwide Disability Solutions Group at 800-600-7808 (voice), or 800-755-0601 (TTY).

The following information is distributed by Apple Computer's Worldwide Disability Solutions Group. Mention of a particular product does not represent an endorsement, either expressed or implied, by Apple Computer, Inc.

Learning and Speaking Disability Solutions
=====

Special Education Software

There are over 1,300 educational software programs available for the Macintosh, ranging from those that teach adverbial clauses to ones that help students explore the anatomy of a whale. Some software comes alive with dazzling color, animation, and stereo sound; other programs are more basic by comparison, incorporating traditional teaching strategies such as drill-and-practice and memorization.

Without knowing more about a particular student (What are his reading skills? spelling skills? comprehension skills? What are her academic and personal goals? interests? abilities?) it's difficult to recommend specific software.

But it is possible for teachers and parents to make that decision once they have enough information about what software is available. Below are four companies that offer a wide selection of educational software for the Macintosh. We encourage you to contact them to find out about their various Macintosh education software solutions.

Dyslexia

The Macintosh is favored by many people with learning disabilities because the software is so easy to use- all Macintosh software works essentially the same way. So once you learn one program, the next one will seem very familiar. This fundamental consistency eliminates frustration for a lot of people.

In addition to the Macintosh's ease-of-use, there is software that can help you structure and organize your ideas, check your spelling as you type (using your own list of frequently misspelled words), and analyze your written documents for grammatical errors. There is even some software that can anticipate the word

you're about the type, and type it for you!

When it comes to managing your daily activities, personal information management software can help manage different areas of your life: keeping an updated TO DO list, maintaining your address book, and scheduling and reminding you of upcoming appointments.

Speech Communication

Every Macintosh has speech capability built-in, which means a Macintosh PowerBook-in addition to doing everything that a Macintosh regularly does- can travel with you, helping you communicate with others. A PowerBook is small and lightweight, so it can be carried around in a backpack or easily attached to a wheelchair, making it a versatile communication tool.

Using "text-to-speech" software, the Macintosh can create synthetic speech from typed-in words, allowing your PowerBook to speak out loud any word or phrase. The Macintosh also has the ability to record and playback a person's own voice (somewhat like a tape recorder), which results in a very high-quality sound.

Special software can help you manage computerized speech so that you can access the appropriate words on demand. Libraries of pictures, symbols, and graphics are often used to build "picture communication boards," enabling speech samples to be selected quickly and easily.

Physical Disability Solutions =====

Keyboards -----

There are dozens of different kinds of keyboards for the Macintosh. Depending on your personal abilities and preferences, any of a number of them may be appropriate.

The right keyboard for you may be the kind that looks like a traditional keyboard, but has large, touch-sensitive keys to help make typing easier. Or maybe your keyboard is the kind that has only seven keys and uses a typing technique called "chording," originally designed for one-handed typists. The Apple Adjustable Keyboard, another possibility, splits into two sections and conforms to the natural position of your arms to make typing comfortable.

Other products include switch-operated, on-screen keyboards that let you type with almost any part of your body, and "smart" keyboards that allow you to customize each key's position, size, and function. We suggest you contact the following companies to learn about, and perhaps sample, their keyboard products.

Pointing Devices -----

You can fine tune your mouse's sensitivity to a degree by using software that comes with your Macintosh. But this kind of refinement may not adequately address your needs. You may need an altogether different kind of pointing device.

If so, there are many from which to choose: head-controlled mice, trackballs (in effect a mouse turned upside down), joysticks, mice of different sizes and speeds, writing pads that function as mice, touch-sensitive screens that act as mice, and even remote-controlled mice.

Another solution is Easy Access, a software program that comes with every Macintosh. The Mouse Keys feature of Easy Access lets you manipulate the screen cursor with the numeric keypad part of the keyboard instead of using the regular mouse. Mouse Keys also makes it easier to make fine adjustments of the cursor position, a feat that is often difficult using a regular mouse. Because the PowerBook does not have a built-in numeric keypad, PowerBook users need an additional extension, MouseKeys for PowerBook, to emulate the numeric keyboard on the standard PowerBook keyboard.

How do you determine which pointing device is the most appropriate for your needs? First you need to find out what's available (beyond the contacts listed below). Try visiting your local newsstand and browsing through a computer magazine devoted to Macintosh technology; there you'll find new and different pointing devices being advertised regularly.

Input Systems

With the right hardware and software, a Macintosh can become a powerful system for learning, working, and playing. But that won't matter to you until you're able to find a way to control the computer... your way.

Keyboards and mice are traditionally used to control personal computers. Although you may not be able to use these devices, you can choose between a number of alternatives, including: a voice recognition system that allows a person to control the computer by talking to it; an on-screen keyboard that facilitates typing without physically touching the keys; and a head-controlled keyboard/mouse that lets a person type using head movements.

There are, in fact, a number of possibilities that will allow people to use a Macintosh for whatever they want. Contact the following companies to learn more about their access products.

Visual Disability Solutions
=====

Speech and Braille

The Macintosh was the first truly graphics-based personal computer, which helps account for a common misconception that it's inaccessible to people who cannot see. In fact, when used with innovative software programs the Macintosh is fully accessible to blind individuals.

When it comes to navigating the Macintosh's screen, software called outSPOKEN gives audio cues to on-screen visual images such as icons, windows, menus, and cursor location (the numeric keypad replaces the need for a mouse). outSPOKEN is compatible with virtually all Macintosh applications, so blind people can use a Macintosh just as sighted people do- in the office, at home, at school, anywhere. Another program called Duxbury Braille Translator converts text to Braille and formats printing on a Braille embosser.

For more information, contact the following companies:

Magnification

There are several things that can be done to enlarge the images on the Macintosh computer's screen. One solution, CloseView, is software that magnifies the screen image up to 16 times its regular size. CloseView works with virtually all Macintosh software, and is free- it's included as part of the Macintosh's system software. (An enhanced version of this software, called inLARGE, is also available as a separate product from Berkeley Systems.)

Other magnification solutions range from monitors that display images in multiple resolutions to magnification lenses that attach to the outside frame of the Macintosh's monitor. You may also want to consider using software that reads text aloud, so that instead of looking at the words on your computer, you can listen to them. Contact the companies below to learn more about their access products for people with vision impairments.

DOS Compatibility Card: No Video When Changing OS (1/96)

Revised: 1/9/96
Security: Everyone

DOS Compatibility Card: No Video When Changing OS (1/96)

=====

Article Created: 9 January 1996

TOPIC -----

I have a DOS Compatibility Card in my Macintosh computer, and when I press the Command/Return key combination on my keyboard to change to MS-DOS/Windows, the screen dims, but I don't get the MS-DOS prompt. Why?

DISCUSSION -----

The most common cause of this is the video cable. If the DOS Compatibility Card video cable is not securely fastened to monitor cable and DOS Compatibility Card, or you do not have the DOS Compatibility Card video cable connected properly, the screen dims, but you will not see the MS-DOS prompt.

You should check the cable connections, and then restart your Macintosh computer. If you do not restart your computer, the monitor will not sync properly. This is because when the PC Setup control panel loads it determines what monitor is connected. When it cannot determine what monitor is connected, the PC Setup control panel defaults to an Apple 16-in. Display setting.

Security: Everyone

PowerBook 5300: Can The Hard Drive Be Partitioned? (1/96)

=====

Article Created: 9 January 1996
Article Reviewed/Updated: 12 January 1996

TOPIC -----

Is hard drive partitioning a supported option with the Macintosh PowerBook 5300 series computers?

DISCUSSION -----

Partitioning either SCSI or IDE Apple hard drives is now supported using the Drive Setup utility posted online. This is discussed in the Drive Setup Guide that is included with the application.

The following is a copy of the Drive Setup Guide statement.

Drive Setup can initialize, partition, and test all of the following:

- Most Apple-qualified SCSI internal drives
- Some Apple-qualified IDE/ATA drives, except an IDE/ATA drive in a PowerBook expansion bay (PC Card, or PCMCIA drives)
- Some 3.5" and 5.25" magneto-optical drives manufactured by Sony, Ricoh, and Fujitsu
- Some 3.5" and 5.25" removable devices manufactured by Syquest and Bernoulli

If you have a CD-ROM drive, it will appear in the Drive Setup List of Drives, but you cannot mount, initialize, partition, or test a CD-ROM disc.

**** Important Note ****

To find out if a particular model of drive is supported by Drive Setup, and for any other information about the drive, contact the drive's manufacturer.

Apple Computer has not evaluated the drives or devices of manufacturers other than Apple, and makes no representations or warranties regarding their compatibility, functionality, or country certification requirements. All understandings, agreements, or warranties, if any, take place directly between the manufacturer and the prospective user.

Mention of non-Apple products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple Computer shall not be liable for the accuracy of any information regarding non-Apple products, or for any damages resulting from the use of such information.

How to Use The Drive Setup Guide

If you would like to look this up in the Drive Setup Guide launch the Drive Setup application then use the following path: Pull down AppleGuide menu (Question Mark icon) in the upper right corner of the Menubar, select Drive Setup Guide, select General and then select storage devices.

These articles can help you locate the Drive Setup 1.0.3 software mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

Third-Party DNS Servers for Macintosh Computers (1/96)

Revised: 1/10/96
Security: Everyone

Third-Party DNS Servers for Macintosh Computers (1/96)

=====

Article Created: 10 January 1996

TOPIC -----

This article provides information on two third-party DNS servers for Macintosh computers.

DISCUSSION -----

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

MIND by Acme Technologies

=====

MIND was the first DNS server available for Macintosh. It has been successfully running on hundreds of sites since its initial beta release in February 1995. Acme Technologies has recently acquired the product and will release a new version soon. You'll be able to download and use the existing beta version until the new one is ready. For more information use the URL below:

<http://mind.acmetech.com/at/mind/>

Features

- Two-way zone transfers (it will function as a secondary DNS automatically)
- Remote monitoring and configuration. Edit hosts files or watch the logs from anywhere on a TCP/IP network.
- Full caching support.
- Plus all the existing features.
- Serve name to address and address to name mapping.
- Supports: \$ORIGIN, \$INCLUDE, SOA, MX, A, CNAME, HINFO, PTR, and TXT records.

- One-way Zone transfers (will act as primary). MIND will function perfectly well as a secondary DNS, but since it can't request a zone transfer from another server, it must be manually synchronized with the primaries.

QuickDNS by Men and Mice

=====

Men & Mice have released QuickDNS Lite and QuickDNS Pro, two new Internet Domain Name Servers for the Macintosh. QuickDNS is currently the only commercially available Domain Name Server for the Macintosh. For more information use the URL below:

<http://www.menandmice.com/QuickDNS/QuickDNS.html>

QuickDNS Pro

QuickDNS Pro is a new fully featured Internet Domain Name Server for the Macintosh. QuickDNS Pro does recursive lookups, zone-transfers and can act as a primary and/or secondary server for an unlimited number of domains.

QuickDNS Pro ships with a program to edit domain information, QuickDNS Admin. QuickDNS Admin is a domain editor which can be used to create, edit, delete and verify domains, import RFC-files (Unix-format) and view the status of QuickDNS Pro.

Running an Internet connection no longer requires a Unix-system. Although WWW, FTP and Mail Servers have been available for the Macintosh, a Domain Name Server has been the missing link for those who want to run a Macintosh only Internet connection.

Every domain on the Internet requires DNS service. The DNS is the invisible service that all the other Internet programs rely on. Every company connected to the Internet has at least one DNS to say who's who on the network.

General features of QuickDNS Pro:

- Recursive name service
- Primary name service
- Secondary name service (available Feb.'96)
- Domain editor - For creating and editing domain information
- Accelerated for Power Macintosh
- Eliminates the need for DNS running on a UNIX server
- Load balancing - A Round robin assignment of IP addresses to the single machine name spreads the load among multiple servers (that is, supports Redundant Array of Inexpensive Computers (RAIC))
- Serves an unlimited number of secondary and primary domains
- Imports RFC-files (Unix-format domain information)
- Fully interrupt-driven operation
- Keeps millisecond-accurate statistics about each name server queried and uses them to tune server performances
- Wildcard support in queries

- Smart cache maintenance
- Logging

QuickDNS Lite

QuickDNS Lite is a caching-only name server that gives a recursive name service to a network. It can not be used to create or modify domains and it can neither be a primary, nor a secondary name server. Installation of QuickDNS Lite is plug and play.

QuickDNS Lite is a perfect bundle with all Internet Servers. QuickDNS Lite running on the same machine as a WWW, Mail or FTP server can increase performance and robustness of the server.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Workgroup Server 9150: Stereo Sound and Audio Devices (1/96)

Revised: 1/10/96
Security: Everyone

Workgroup Server 9150: Stereo Sound and Audio Devices (1/96)

Article Created: 10 January 1996

TOPIC -----

This article describes stereo sound and audio devices you can use with a Workgroup Server 9150.

DISCUSSION -----

Your server can play and record stereo sound from a variety of sources. To provide or reproduce stereo sound, you can connect audio devices to the line input or sound input ports, and to the sound output port on the server. You can also use the server's internal CD-ROM drive to play audio compact discs (CDs).

The server's line input ports accepts an audio connector known as a RCA type (phono) plug. The server's sound ports accept an audio connector known as a stereo miniplug. This connector is the type used on headphones for a personal tape player, for example. If your equipment uses a different type of connector, you can purchase an adapter at an electronics supply store.

Connecting an Audio Device

To play or record sound with your server, you can attach a microphone, amplifier, tape recorder, or a pair of speakers. Follow these steps to connect an audio device to the server.

IMPORTANT: The Workgroup Server 9150 is designed to work as a server, and it is not designed for use with speech recognition systems. Do not use the Apple PlainTalk Microphone with your server.

- 1) Make sure that the audio device has a cable with a stereo miniplug connector or, if you're using the line input ports, RCA connectors.
- 2) Place the audio device near the server.
- 3) Shut down the server and turn off the audio device.

4) Attach the cable to the audio device and to the sound port on the server.

5) Turn on the server and the audio device and begin working with sound.

Open Transport: User Configuration Not Available (1/96)

=====

Article Created: 10 January 1996

TOPIC -----

I am running Open Transport 1.0.6 on my computer, and I need to set the AppleTalk address manually. The option for User Configuration in the AppleTalk control panel, when set to Ethernet, is dimmed.

DISCUSSION -----

This option is not available in Open Transport 1.0.7 or lower, but it is available in Open Transport 1.0.8 and higher in Advanced User Mode.

CLW 12/600 PS & CLW12/660 PS: Configuring For Solaris (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS & CLW12/660 PS: Configuring For Solaris (10/96)

Article Created: 10 January 1996
Article Reviewed/Updated: 21 August 1996

TOPIC -----

This article provides information on configuring the Apple Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS printers to a Solaris workstation.

DISCUSSION -----

Overview of Solaris Printing

Solaris 2.3, 2.4 and 2.5 printing use lp printing available with UNIX System 5. Solaris includes two utilities that add BSD features to the lp printing system.

- lpsystem - register remote systems with the print service.

This utility supports System V network printing and provides compatability with BSD network printing (lpd)

- lpr - send job to the printer.

This utility is actually version of lp that supports lpr flags, for backwards compatability to SunOS 4.x

The following instructions are provided for Solaris (SunOS 5.x) system administrators. SunOS 4.x (sometimes called Solaris 1.x) are in the Color LaserWriter 12/600 PS manual. SunOS 4.x is a version of BSD UNIX and uses lpr for printing.

Before configuring the Solaris system, the Color LaserWriter 12/600 PS needs to be installed on the Ethernet network and assigned an IP address. See your Color LaserWriter 12/600 PS User's Guide for detailed instructions.

Apple Computer supports printing only from Solaris 2.x over ethernet using TCP/IP and lp to the Color LaserWriter 12/600 PS printer. Alternative forms of printing with other protocols, such as PAP in Appletalk, or physical connections

such as direct parallel connections are possible, but not supported by Apple Computer Inc.

Steps for Solaris:
=====

Step 1

Login as root

Step 2

Run admintool

Step 3

Select "print manager"

Step 4

From the "Edit" Menu select "Add Printer"

Step 5

Select "Add access to remote printer"

Step 6

Set the "Printer Name"

The printer name is the name of the printer queue referred to in lp command. For example, if you create a printer queue called "colorlw", you would print with the using the following:

```
lp -d colorlw <filename>
```

Step 7

Set the "Printer Server"

Use the hostname or IP address of the printer. The hostname should be entered in the /etc/hosts file, NIS database or DNS.

Step 8

Verify or change "Print Server OS" to "BSD"

Click "add" when done. The new printer appears in the Print manager window.

Step 9

Change the file contents to PostScript.

Select "edit" -> "modify" -> "name of printer"

Change the "file contents" to "PostScript" and click apply. The default is "any"

Click "apply" to save changes.

Setting the "file contents to PostScript" allows all files to print to the Color Laserwriter correctly. Without making this change, text jobs sent to the printer using lp and lpr will not print.

Printing from Specific Applications

=====

The Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS printers accept only PostScript print jobs. If configured properly, Solaris converts text jobs to a basic PostScript job that results in plain, portrait, courier text output.

- Printtool: Openwindows tool for printing files

Printtool creates PostScript jobs and will work normally. Users can type in path names or use drag and drop icons from the file manager to the icon well. The default format will product 2-UP landscape output that has been "prettied" in the mp utility.

- MAE: The virtual Macintosh

MAE produces PostScript using lprwriter. Set lprwriter to "lp -d <printer queue name>" If AppleTalk is supported on the Ethernet, MAE users can use LaserWriter driver and print using AppleTalk as well. MAE users can load the Color LaserWriter Software into MAE, but should be aware that ColorSync 2.0 will NOT cailibrate color when printing using lprwriter. MAE users MUST use the Laserwriter 8.3 driver and print using AppleTalk.

- lp - send requests to an LP print service

lp is the standard line command used for printing files in System V UNIX.

For example:

lp -d colorlw <filename>

- lpr - send job to the printer

Although Solaris is System V, an lpr utility is provided. The lpr command is a front end to lp and is not a normal version of lpr. However the differences should not affect the use of the Color LaserWriter 12/600 PS printer.

Example print command:

lpr -P colorlw <filename>

For more information on configuring printing in Solaris, you should consult the Solaris documentation that came with your workstation. For more information on UNIX printing in general, you should consult a UNIX system administration book such as the "UNIX System Administration Handbook" by Evi Nemeth, Garth Snyder, Scott Seebastian, Trent R. Hein.

Article Change History:

23 Oct 1996 - Added Color LaserWriter 12/660 PS printer.

21 Aug 1996 - Removed unnecessary steps.

Apple Telecom Software 2.3.2: Read Me (5/96)

Article Created: 10 January 1996
Article Reviewed/Updated: 27 May 1996

TOPIC -----

This article contains the ReadMe included with the Apple Telecom Software v2.3.2 posted online.

DISCUSSION -----

Apple Telecom Software
=====

This software runs on the following machines with their respective Express Modem internal modems:

- PowerBook 160, 165, 165c, 180, 180c, using an internal Apple PowerBook 14.4 Modem Card.
- PowerBook Duo 210, 230, 250, 270c, 280, 280c, 2300c, using an internal Apple PowerBook Duo 14.4 Modem.
- PowerBook 520, 520c, 540, 540c (with or without PowerPC processor upgrade), using an internal Apple PowerBook Express Modem II Card.
- LC 575, Macintosh Quadra, LC, Performa 630, using an internal Macintosh Express Fax/Modem (for the United States and Japan only).

Installing over an older version of the software

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

Note: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to

the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

Preferred CCL scripts for Apple Remote Access

ARA 1.0: Express Modem ARA 1.x (in Extensions folder in System Folder)

ARA 2.0: Express Modem ARA 2.x (in Extensions folder in System Folder)

Note: These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide.

Two additional, optional connection (CCL) files, named Express Modem ARA 1.x/CNG and Express Modem ARA 2.x/CNG, are installed as well. When you use them, the Express Modem transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as a GeoPort Telecom Adapter), you should select one of these connection files in the Apple Remote Access Setup control panel.

Note: The Express Modem ARA 1.x/CNG and Express Modem ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Fax Sender GX with QuickDraw GX 1.1

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex greyscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

Note: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

Note: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

Auto-answer setting

If Fax Terminal is set to Auto-answer, the Manual Receive is disabled.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript® printers.

Troubleshooting

Connecting to online services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the Express Modem to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this

suppresses the CARRIER message).

Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying incoming calls

When answering your phone line, the Express Modem will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application, we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

Removing fax storage folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Resetting a blacklisting error message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

What goes where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- Express Modem Read Me
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Gateway manual for users who upgrade electronically)
- About Fax Sender GX (Fax Sender GX manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- Modem AT Command Set
- Express Modem ARA 1.x/CNG (optional, transmits data calling tone)
- Express Modem ARA 2.x/CNG (optional, transmits data calling tone)

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- Express Modem ARA 1.x (Apple Remote Access 1.0 CCL)
- Express Modem ARA 2.x (Apple Remote Access 2.0 CCL)

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)
- Electronic Telephone (sound resource)

GeoPort Telecom Adapter ReadMe

=====

Software included in the GeoPort Telecom Adapter Kit

Apple Telecom Software

This includes all software necessary to use the GeoPort Telecom Adapter with the following Macintosh systems:

- Centris 660AV, Quadra 660AV and Quadra 840AV.
- Power Macintosh 6100 series, 7100 series, 7200 series, 7500/100, 8100 series, 8500/120, and 9500 series.

The Apple Telecom User's Guide contains complete information about installing and using this software. An electronic Apple Telecom Upgrade Manual is included in the Telecom Documents folder so that you can learn about the new features if you upgraded electronically and don't have the Apple Telecom User's Guide. Disks 1 and 2 can also be used to install Apple Telecom 2.x software on Macintosh systems equipped with an Express Modem card.

Note: For Power Macintosh 7200 series, 7500/100, 8500/120, and 9500 series, version 2.1 or higher of Apple Telecom Software is required. If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any LocalTalk devices attached to the printer port (serial devices can remain attached).

Important If you select "Sleep" from the Special Menu available on some Power Macintosh models while there is an active GeoPort connection, the GeoPort Telecom Adapter will automatically disconnect the call without warning. When a Power Macintosh 7200 series model is in the low-power mode, the GeoPort Telecom Adapter will wake up the machine if the telephone rings and the machine is awaiting an incoming call. The monitor will remain in the low-power mode. While a connection is open via a GeoPort Telecom Adapter, your Power Macintosh will not enter the low-power mode, but the monitor will dim the screen.

MegaPhone (for United States, Canada, and Japan only)

This is a screen-based telephone application that delivers full support of the telephony capabilities of the Apple Telecom 2.x software, including support for dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information, and voice-mail functions.

The GeoPort Telecom Adapter Kit also includes a free 30-day trial of call logging, MegaDial dialing manager, intelligent synchronization with directory information (saving telephone numbers to a PowerTalk catalog, for example), and other extended capabilities.

See also: the MegaPhone electronic manual included on Disk 3 (Telecom Applications).

Note: MegaPhone is not installed by the Apple Telecom Installer program. You must install it separately.

SITcomm SE/GTA (for United States and Canada only)

This is a terminal emulator application. With SITcomm SE/GTA (Special Edition for GeoPort Telecom Adapter), your Macintosh can communicate with a variety of other computers, linked by serial cables or by telephone lines.

With SITcomm you can exchange information with:

- A colleague who is using another computer with similar communications

software.

- Text-based information and electronic mail services, such as CompuServe or MCI Mail.
- Your company or school's remote minicomputer or mainframe.

See also: the SITcomm SE electronic manual included on Disk 4 (Telecom Applications).

Note: SITcomm is not installed by the Apple Telecom Installer program. You must install it separately.

Note: SITcomm (Disk 4) is not included with free upgrades. You can order the full upgrade, including SITcomm SE and the Apple Telecom User's Guide manual, by calling the Apple Order Center. Ask for the Apple Telecom software version 2.x upgrade for use with your GeoPort Telecom Adapter.

Upgrading from previous releases of GeoPort Telecom Adapter software

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

Note: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

When you have installed over an older version, the folders "Modem Documents" and "Express Fax" and the file "GeoPort ReadMe" may still be left on your hard disk from the earlier version. These are not necessary for using the newer version; you may delete them.

Connection (CCL) scripts for Apple Remote Access

Use the following connection scripts with Apple Remote Access:

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)
ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide. Apple Remote Access 1.0 does not support Power Macintosh computers. You can order an upgrade for Apple Remote Access by calling the Apple Order Center.

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter), you should select one of these connection files in the Apple Remote Access Setup

control panel.

Note: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Remote Access Dial Back

If your Remote Access server uses a "Dial Back" feature, the server's return call back to your machine may be inadvertently directed to an open telephone application. To avoid this situation, either close these applications or open the Express Modem control panel and choose "Data" as the default call type when you expect an incoming call from another computer.

Using Fax Sender GX with QuickDraw GX 1.1

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex greyscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

Note: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you

are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

Note: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript® printers.

Troubleshooting

Connecting to online services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the GeoPort Telecom Adapter to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying incoming calls

When answering your phone line, the GeoPort Telecom Adapter will attempt to

determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application (such as MegaPhone), we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

If you have problems receiving calls from data modems (when using the Apple Remote Access dial back feature, for example), try decreasing the number of rings to Auto-answer in the Express Modem control panel (if permitted in your country). Some calling modems may time out and disconnect before your modem answers if the number of rings is too high.

Removing fax storage folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Using a Centris 660av or Quadra 660av/840av

If you are using a Centris 660av or Quadra 660av/840av and experience errors when attempting to establish a connection, you may need to change the audio settings on your computer. The default setting of 24.000 kHz is compatible with the GeoPort Telecom Adapter. To change this setting, open the sound control panel, choose "Sound Out" and select the "24.000 kHz" sampling rate.

Resetting a blacklisting error message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

Clicking sound from GeoPort Telecom Adapter

If your machine freezes, the GeoPort Telecom Adapter can lose its connection with your machine and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your machine.

Port Selection

The interface for selecting the correct communications port has been simplified since GeoPort Telecom Adapter software versions 1.0.2 (Power Macintosh) and 1.2.2 (660av/840av). The "Use internal modem instead of modem port" checkbox has been removed from the Express Modem Control Panel. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. If so, all serial communications are first processed by the Express Modem software and transmitted through the GeoPort Telecom Adapter. If not, serial communication passes through the modem port directly.

GeoPort has been removed from the list of ports. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. Select Modem Port whenever you wish to communicate through the GeoPort Telecom Adapter.

What goes where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- GeoPort Telecom Adapter ReadMe
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Power Macintosh 7500 & 8500: Vertical Lines Follow Cursor (1/96)

Revised: 3/21/96
Security: Everyone

Power Macintosh 7500 & 8500: Vertical Lines Follow Cursor (1/96)

=====

Article Created: 10 January 1996

TOPIC -----

I have a Power Macintosh 7500 series computer, and I have recently noticed that two vertical lines appear to be following the cursor. What could cause this, and how can I resolve it?

DISCUSSION -----

Improper installation of VRAM on Power Macintosh 7500 and 8500 series computers causes these symptoms. If you have 2 MB of VRAM installed, you must install the VRAM DIMMs into the slots labeled 1. For example:

1	_____	1 MB VRAM DIMM
2	_____	
1	_____	1 MB VRAM DIMM
2	_____	

Also, you cannot install 3 MB of VRAM. The Power Macintosh 7500 and 8500 series computer allow only for 2 and 4 MB VRAM configurations.

Grolier's Encyclopedia: Errors and Lockups When Searching (1/96)

Revised: 1/12/96
Security: Everyone

Grolier's Encyclopedia: Errors and Lockups When Searching (1/96)

=====

Article Created: 10 January 1996
Article Reviewed/Updated: 12 January 1996

TOPIC -----

When attempting to search on the Grolier's Encyclopedia CD (version 7.0.4) that was included with my Macintosh computer, my computer locks up or displays a Type 11 error. How can I prevent this from happening?

DISCUSSION -----

The Grolier's application requires that a printer is chosen in the Chooser. If a printer is not selected, the application cannot access necessary resources in the System file. To avoid these lock-ups and errors you must open the Chooser and select any printer driver.

These errors can occur on some PowerPC based Power Macintosh or Macintosh Performa series computer that have not yet had a printer chosen in the Chooser. Apple has verified that this error occurs on Power Macintosh 5200CD, 6200CD, 5300CD, 6300CD, 7200, 7500, 8100, 8500 and 9500 computers using System 7.5.x.

Apple has notified Mindscape (the distributor of the Grolier's Encyclopedia) of this issue.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Note:

The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

The following computers are in the Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

PowerBook 200 & Dock: MacTCP Has No Icons When Removed (1/96)

Revised: 1/10/96
Security: Everyone

PowerBook 200 & Dock: MacTCP Has No Icons When Removed (1/96)

=====

Article Created: 10 January 1996

TOPIC -----

When my PowerBook 200 Series (Duo) is in the Dock, connect to Ethernet, and EtherTalk is selected in the MacTCP control panel. When I then remove the PowerBook from the Dock, the MacTCP control panel will show no network interface icons when opened.

If the PowerBook is reconnected to the same AppleTalk network with either LocalTalk, or Apple Remote Access (ARA), MacTCP will work properly. Reconfiguring MacTCP, however, is difficult because no zones are available to select a different MacIP server.

PowerBook 200 Series computers using the Ethernet icon in the MacTCP control panel do not operate this way. Why does this happen?

DISCUSSION -----

The problem is the MacTCP control panel's inability to properly handle the disappearance of the Ethernet card. While the PowerBook 200 Series is docked with the EtherTalk icon selected in the MacTCP control panel, TCP/IP is being encapsulated in AppleTalk through an Ethernet card. When the PowerBook is removed from the Dock, the card is no longer available.

Some software recognizes that network configurations can change when a PowerBook 200 Series is not in the Dock, and adjust accordingly. For example AppleTalk, controlled by the Network control panel, automatically changes to LocalTalk Built In. MacTCP, however, maintains its last setting and works with whatever AppleTalk interface is selected in the Network control panel. This is why the PowerBook functions properly when connected to the network with the same MacIP server through either LocalTalk, or ARA.

Ordinarily on desktop systems, when the MacTCP control panel is opened, it presents a list of icons. If AppleTalk is turned on, IP is represented by either a LocalTalk, EtherTalk, TokenTalk, or Remote Only icon -- this depends on

which network interface is available. When the Ethernet card is not accessible by the PowerBook, the MacTCP control panel does not display EtherTalk. Although MacTCP may continue to work (as described above), it does not display an icon for the AppleTalk connection being used, and because the PowerBook has no Token Ring or Ethernet cards, no other icons are displayed.

If you want or need to have the correct icon displayed, go to the Network control panel, and reselect the AppleTalk connection. MacTCP will note the change in AppleTalk configuration, and refresh its icons when opened again.

AICK: Config PPP Does Not Have Enough Script Lines (1/96)

Revised: 1/11/96
Security: Everyone

AICK: Config PPP Does Not Have Enough Script Lines (1/96)

=====

Article Created: 11 January 1996

TOPIC -----

I am trying to get my Config PPP control panel connectscript to work with the Chameleon server software my local service provider (ISP) running. I do not seem to have enough script lines available for the logon script. I was given 9 lines but my Config PPP only has 8 lines.

DISCUSSION -----

The Apple Internet Connection Kit (AICK) dialer (Apple Internet Dialer) is an alternate user interface for configuring MacPPP, MacTCP, Open Transport's TCP/IP control panel, and some parameters in Internet Config. Configure your internet parameters in one place, rather than four.

MacPPP 2.1.4 (included with AICK) and FreePPP 1.0 are both derived from an earlier version of MacPPP - MacPPP 2.1.2SD. The documentation included with FreePPP and in particular the file Installing MacPPP provides the extra details you may need to configure AICK to work with your ISP.

You can put more than one command per line in both MacPPP and the AICK dialer, thereby working around the 8 line limit in many cases. With this information you and your provider should be able to come up with a script that works. Fax or email your ISP the Installing MacPPP document and then ask them to save the "recipe" you discover.

LaserWriter: How to Check ROM Version (1/96)

Revised: 1/12/96
Security: Everyone

LaserWriter: How to Check ROM Version (1/96)

=====

Article Created: 12 January 1996

TOPIC -----

This article describes how to check the ROM version of your PostScript printer.

DISCUSSION -----

The version of ROM in your printer is printed on the startup page, vertically on the right margin.

You can also use the Apple Printer Utility to check what version of the IOP ROM the LaserWriter has installed:

Step 1

Launch the Apple Printer Utility, select the zone in which the LaserWriter is located, click to select the printer, click Open Printer.

Step 2

Click the arrow to the left of Printer Information, you will see the version of ROM and, depending on the type of LaserWriter, the version of PostScript ROMs also.

Installer & Problem With Disk Error Message (7/96)

Revised: 7/31/96
Security: Everyone

Installer & "Problem With Disk" Error Message (7/96)

=====

Article Created: 15 January 1996
Article Reviewed/Updated: 31 July 1996

TOPIC -----

When I try to install the Apple Internet Connection Kit (AICK) on my Macintosh Performa computer, the message "There is a problem with the disk you are installing onto" appears.

I have reinitialized my hard drive and restored a new System Folder, but get the same failure. What might be causing this? I have no other SCSI devices attached.

DISCUSSION -----

Here are a couple troubleshooting procedures which should resolve this issue:

First

A new System Folder on a Macintosh Performa computer has Folder Protection enabled in the General Controls control panel by default. This setting causes this installer, and possibly others like a StyleWriter or Color StyleWriter installer programs to fail.

Disable Folder Protection in the General Controls control panel and then install AICK or other software.

Second

Remove the Launcher from the control panels folder and restart.

Article Change History:

31 Jul 1996 - Added second procedure.
09 May 1996 - Changed title and made article more generic.

PowerBook 190 & 5300 Series: Is NSI 1.5.1 Needed (1/96)

Revised: 1/16/96
Security: Everyone

PowerBook 190 & 5300 Series: Is NSI 1.5.1 Needed (1/96)

=====

Article Created: 16 January 1996

TOPIC -----

Do I need to install Network Software Installer (NSI) 1.5.1 on my PowerBook 5300cs?

DISCUSSION -----

The component software (except for AppleTalk v58.1.5) in NSI 1.5.1 is included with System 7.5.2 on PowerBook 190 and 5300 series computers, so you do not need to install NSI 1.5.1. The only exception, AppleTalk v58.1.6 which supports IRTalk is installed on the PowerBook 190 and 5300 series computers. IRTalk is a built-in infrared technology implementation.

NOTE: IRTalk is an option on the PowerBook 190 series computers. (Macintosh PowerBook Infrared Upgrade Kit Order No. M4071LL/A.)

ColorSync 2.0: Tektronix Printer Profile Compatibility (1/96)

Revised: 1/16/96
Security: Everyone

ColorSync 2.0: Tektronix Printer Profile Compatibility (1/96)

Article Created: 16 January 1996

TOPIC -----

With ColorSync 2.0, I cannot access the ColorSync Printer profile, Tek Phaser 540 Plus, using the Filter Module in Adobe Photoshop. The profile does show up if I choose the Acquire command in the File menu in Photoshop.

I called Tektronix and downloaded ColorSync profile (540+ 16x16) from their ftp site to try it. Tektronix has ColorSync profiles for the Tektronix Phaser 140, 220i, 240, 340, and 540. The Tek Phaser 540 Plus printer profile was placed in the ColorSync Profiles folder along with Color LaserWriter 12/600 PS Profile. The Color LaserWriter 12/600 PS Profile does show up in the ColorSync Filter dialog box, however, the Tek Phaser 540 Plus Profile does not. What is wrong?

DISCUSSION -----

The problem is not with the profile or with ColorSync. It is a limitation of how the Plug-ins/Photoshop 3.0 work currently. A workaround is provided below.

We spoke with engineering and they verified what is stated in the ReadMe for the Plug-ins:

To use the Filter Module:

1. ...
2. ...
3. Click the "OK" button to start filtering.

Note: Due to limitations of the Photoshop Filter Module API, the ColorSync Filter Module can only match images from/to the same color space. Therefore, it cannot match an RGB image for a CMYK device, and vice versa.

So in other words, the color space for the profile MUST match the color space of the current image in Photoshop in order for the profiles to show up in the Color Match - ColorSync Filter dialog. Color matching using the Filter plug-in can only be performed on "like" color spaces, for example image = RGB and device profile = RGB. With regard to why the Color LaserWriter 12/600 PS profile shows up in the Filter plug-in and the Tektronix 540P does not, this is because the LaserWriter 12/600 PS profile is defined in the RGB space while the Tektronix profile is defined in CMYK. It is possible to change the color space of the image in Photoshop by selecting a different color space (for example CMYK color) from the Mode menu, however, you will be using Adobe's proprietary color space conversion.

A better workaround would be to use the ColorSync Export-to-TIFF filter which enables you to convert between color spaces accurately by using input and output profiles. Once exported, you can then re-open the TIFF image (which was exported) and directly print it -- since color space conversion of the TIFF image to CMYK has already been performed.

Future versions of Photoshop will most likely become fully ColorSync 2.0 compatible.

Newton Backup Utility: How to Expand SYSUPDT.EX (12/96)

Revised: 12/17/96
Security: Everyone

Newton Backup Utility: How to Expand SYSUPDT.EX (12/96)

=====

Article Created: 16 January 1996
Article Reviewed/Updated: 17 December 1996

TOPIC -----

I am running Windows 95 and am unable to expand the SYSUPDT.EX_ included on DISK1 of the Newton Backup Utility. There is no equivalent expand program included with Windows 95.

Is there another way to expand the SYSUPDT.EX_ under Windows 95?

DISCUSSION -----

The third-party utilities WinZip or PK Zip for Windows 95 will expand the files on the Newton Backup Utility disk. You can also use Microsoft's expand.exe utility. If you have Windows 95 on CD-ROM disc, there is a directory called OTHER\OLDMSDOS on the disc and located in this directory is expand.exe. Copy expand.exe from this directory to any location in the path statement to make it available for expanding the Newton file.

Microsoft Technical Support said if you have Windows 95 on floppy disks, you can copy expand.exe from another computer. This is not a copyright violation since it is included on the Compact Disc version of Windows 95.

Article Change History:
17 Dec 1996 - Added third-party utilities.

System 7.5 Update 2.0: What's Inside Control Panels? (3/96)

=====

Article Created: 16 January 1996
Article Reviewed/Updated: 20 March 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

Macintosh System 7.5.3
What's Inside the Control Panels Folder?

About this document

If you're curious about the contents of the Control Panels folder, this document provides a brief description of each control panel. You can use these descriptions to help determine which control panels you may need and which ones you may not need.

What is a control panel?

A control panel is a small piece of software that allows you to change your computer's settings to meet your needs. For example, you can change the pattern or color of your computer's desktop using the Desktop Patterns control panel.

You can use the Extensions Manager control panel to turn off any control panel you don't need on your computer.

Depending on the type of computer you have, the contents of your Control Panels folder may vary. You might have control panels that were added by third-party applications, and you don't need all the control panels described below. For complete instructions on using control panels, see Macintosh Guide, available in the Guide (question mark) menu when the Finder is the active program.

Apple Menu Options: You can turn the submenus available in the Apple menu (for

recently used documents, programs and servers) on or off. You can also set the number of items that will appear in the menus. Works on all Mac OS-based computers that use System 7.5.

AppleTalk: You can specify AppleTalk settings (such as connection port and zone) for use with Apple's Open Transport networking. When you install Open Transport, the Network and MacTCP control panels are replaced with the AppleTalk and TCP/IP control panels. Works on all Mac OS-based computers that support Open Transport.

ATM GX: Makes your Type 1 fonts look sharp and clear at any point size—both on your screen and on paper. Improves the output of QuickDraw printers, such as the ImageWriter and StyleWriter series. Works on all Mac OS-based computers that use System 7.5

Auto Power On/Off: You can specify dates and times for your computer to automatically turn on or off, set a warning interval before turning off, and specify that your computer automatically restart after a power failure. Works only on computers that can be turned on from the keyboard (does not work on Macintosh PowerBook 500 models).

AutoRemounter: You can turn off the Losing Network Services message that appears when your PowerBook sleeps. You can also automatically reconnect your computer to any shared disks that were disconnected when your PowerBook went to sleep. Works on all Macintosh PowerBooks except models 100, 140, 145, 145B, and 170.

Brightness: You can adjust screen brightness. Works on Mac OS-based computers with onscreen brightness control, such as the Macintosh Classic and Classic II.

Button: You can disable the built-in volume and contrast buttons on the front of your computer. Useful in classroom situations with young students. Works on the Macintosh Performa and Macintosh LC 500 series of computers.

Cache Switch: You can turn processor caching for 68040-based Mac OS-based computers on or off. For compatibility reasons, processor caching may need to be turned off for some applications. Works on all 68040-based Mac OS computers, such as the Macintosh Quadra, Macintosh Centris, and Performa 400/500 models.

Color: You can set the color of highlighted text and window borders. Works on all Mac OS-based computers that use System 7.5 and have a color monitor.

CloseView: You can magnify your computer display for easier viewing. Works on all Mac OS-based computers except PowerPC-based models.

ColorSync System Profile: Part of the ColorSync system that provides consistent color across various types of equipment (printers, scanners, monitors, and so on). In the control panel, you can view and select ColorSync profiles. Works on all Mac OS-based computers that support ColorSync.

Control Strip: You can display or hide the Control Strip, and specify a font for Control Strip menus. With the Control Strip, you can control a variety of settings directly from your desktop, such as sound volume, monitor resolution, file sharing, and so on. Works with all Mac OS-based computers that use System

7.5.

Date & Time: You can set the date, time, and time zone on your computer. You can also set how dates and times are displayed. Works with all Mac OS-based computers that use System 7.5.

Desktop Patterns: You can change the pattern or color of your computer's desktop. Works with all Mac OS-based computers that use System 7.5.

Easy Access: You can press keys used in keyboard combinations one at a time (Sticky Keys), move the pointer using the numeric keypad (Mouse Keys), and set typing speed with audible response (Slow Keys). Works on all Mac OS-based computers that use System 7.5.

Extensions Manager: You can turn your computer's system extensions on or off. Extensions include items in the Extensions folder, control panels, and other startup programs in the System Folder. Works on all Mac OS-based computers that use System 7.5.

File Sharing Monitor: When file sharing is turned on, this control panel displays a list of users who are connected to your computer. Works on all Mac OS-based computers that use System 7.5.

General Controls: You can set various options, including desktop hiding, Launcher visibility at startup, folder protection to prevent folders and files from being deleted, insertion point blinking rate, menu selection blinking, and the default folder that appears in the Save dialog box. Works on all Mac OS-based computers that use System 7.5.

Keyboard: You can set the repeat rate and delay before repeat for your keyboard. Also lets you switch keyboard layouts. Works on all Mac OS-based computers that use System 7.5.

Labels: You can customize the color and text of file labels. (You can see labels in the Finder.) Works on all Mac OS-based computers that use System 7.5.

Launcher: You can open the Launcher window, where you can easily find and open programs. You can add items to the Launcher by placing an alias to your favorite applications, files, or folders in the Launcher Items folder in the System Folder.

MacTCP: You can control how your computer is connected to network services (such as the Internet) that use TCP/IP protocol. Works on Mac OS-based computers that use System 7.5. Does not work with Open Transport.

Macintosh Easy Open: You can customize the way a Mac OS or DOS/Windows document is translated, so you can open a document when you do not have the application that was used to create the document. Works on Mac OS-based computers that use System 7.5.

Map: You can locate popular cities around the world, and display longitude and latitude coordinates and local time. Lets you set the location of your computer. Works on all Mac OS-based computers that use System 7.5.

Memory: You can control memory settings, including disk cache, virtual memory, and RAM disk configuration. Works on all Mac OS-based computers that use System 7.5. Do not remove this control panel if you use a RAM disk.

Monitors: You can set the number of colors or shades of gray that are displayed. Sets monitor resolution for multiple scan monitors. On some Mac OS-based computers, the Monitors control panel is replaced by the Monitors & Sound control panel.

Monitors & Sound: A combined control panel that replaces the separate Sound and Monitors control panels. (It also replaces the Sound & Displays control panel.) You can use this control panel to specify information about monitors attached to your computer (for example, monitor resolution, monitor bit depth, monitor arrangement, and so on). You can also use this control panel to specify information about other audiovisual equipment attached to your computer (for example, audio CD players, VCRs, video cameras, external speakers, and so on.) Works on PowerPC-based computers with PCI slots.

Mouse: You can set the tracking speed and double-click speed for your mouse. Works on all Mac OS-based computers that use System 7.5.

Network: You can choose between network options installed on your computer. Typical choices are LocalTalk, Ethernet, or Token Ring. Works on all Mac OS-based computers that use System 7.5. Does not work with Open Transport.

Numbers: You can control how numbers and currencies are displayed on your computer (for example, where decimal points appear). Works on all Mac OS-based computers that use System 7.5.

PC Exchange: Allows your Mac OS-based computer to read files from ProDOS and MS-DOS disks. You can specify the Mac OS application program used to open a DOS document. You can also use SyQuest and Bernoulli disks on your desktop. Works on all Mac OS-based computers that use System 7.5.

PC Setup: You can set options for the DOS Compatibility Card. Works on all Mac OS-based computers that support the DOS Compatibility Card.

Power Macintosh Card: Used with 68040-based Mac OS computers that have an expansion card with a PowerPC processor. You can select which processor to use. Works on all Mac OS-based computers with a Power Macintosh Upgrade card.

PowerBook: You can set PowerBook-specific items, including hard disk sleep, system sleep, and screen dimming. You can also set processor cycling and (on certain computers) reduced processor speed. Controls backlight intensity and built-in video. Works on all Macintosh PowerBooks.

PowerBook Display: You can duplicate the images on your PowerBook display on an external monitor. Useful for controlling a presentation from your PowerBook while displaying the presentation on a large room monitor. Works on the Macintosh PowerBooks 160, 165c, 180, 180c, 200, and 500 models.

PowerBook Setup: You can set a unique SCSI ID number for your PowerBook when

you're using SCSI disk mode. You can also specify a Normal or Compatible modem setting for your PowerBook. Use Normal for communication applications that are compatible with the Macintosh Communications Toolbox. Use Compatible for communication applications that are not compatible with the Communications Toolbox. Works on all Macintosh PowerBook 200 and 500 models.

PowerTalk Setup: You can turn collaboration services on or shut them off after a period of inactivity. You can also access your Key Chain. Works on all Mac OS-based computers that support PowerTalk.

Screen: You can control brightness and contrast for a built-in monitor. Works on all Mac OS-based computers with built-in monitors, such as the Macintosh Performa 400/500 models.

Serial Switch: Provides compatibility for some applications that use the printer or modem port. You can set the serial port option to Faster or More Compatible. Works on Macintosh IIfx and Macintosh Quadra 950 computers.

Sharing Setup: You can set file sharing options and specify a network name for your computer. Works on all Mac OS-based computers that use System 7.5.

Sound: You can set the alert sound and volume and specify a sound input and sound output source for your computer. On PowerPC-based computers with PCI slots, this control panel is replaced by the Monitors & Sound control panel.

Sound & Displays: A combined control panel that replaces the separate Sound and Monitors control panels. You can use this control panel to specify information about monitors attached to your computer (for example, monitor resolution, monitor bit depth, monitor arrangement, and so on). You can also use this control panel to specify information about other audiovisual equipment attached to your computer (for example, audio CD players, VCRs, video cameras, external speakers, and so on). Works on PowerPC-based computers with PCI slots.

Speech: You can set options for hearing text read aloud by the computer. If you have Speakable Items software and a PlainTalk-compatible microphone, you can set options for giving spoken commands to the computer. Works on all Macintosh 660AV and 840AV computers. Also works on all PowerPC-based AV computers.

Startup Disk: You can select the disk used to start up your computer. Works on all Mac OS-based computers that use System 7.5.

TCP/IP: You can specify TCP/IP settings for use with Apple's Open Transport networking. When you install Open Transport, the Network and MacTCP control panels are replaced with the AppleTalk and TCP/IP control panels. Works on all Mac OS-based computers that support Open Transport.

Text: You can select from the text features for the script systems installed on your computer. Works on all Mac OS-based computers that use System 7.5.

Trackpad: You can set how far the pointer moves when you move your finger on the trackpad, and how fast you double-click. Works on all Macintosh PowerBook 500/5000 models.

Users & Groups: You can specify who can access your computer's hard disk when file sharing is turned on. Works on all Mac OS-based computers that use System 7.5.

Views: You can customize how information is displayed in Finder windows. Works on all Mac OS-based computers that use System 7.5.

WindowShade: You can set whether to hide a window by clicking on its title bar. Works on all Mac OS-based computers that use System 7.5.

System 7.5 Update 2.0: What's Inside Extensions Folder? (8/96)

=====

Article Created: 16 January 1996
Article Reviewed/Updated: 5 August 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

Macintosh System 7.5.3
What's Inside the Extensions Folder?

About this document

If you're curious about the contents of the Extensions folder, this document provides a brief description of each extension. You can use these descriptions to help determine which extensions you may need and which ones you may not need.

What is an extension?

An extension is a small file that changes how your computer operates. Unlike a control panel, you typically do not have any direct interaction with an extension. An extension makes the appropriate changes when you start your computer and remains active until you shut down your computer.

Depending on the type of computer you have, the contents of your Extensions folder may vary. You might have extensions that were added by third-party applications, and you don't need to have all the extensions described below. You can use the Extensions Manager control panel to turn off any extension you don't need.

9500 Guide Additions: Adds step-by-step instructions for using features specific to the Power Macintosh 9500 to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the

Finder is active.

A/ROSE: Allows communication between your computer's main logic board and NuBus cards that run the Apple Real-Time Operating System. Examples of such NuBus cards include the Apple Token Ring 4.16 NB card and the Apple Serial NB card.

About Apple Guide: Provides information about how to use Apple's onscreen help system. You can access About Apple Guide from the Guide (question mark) menu when the Finder is active.

AppleCD Audio Player Guide: Provides step-by-step instructions for using the AppleCD Audio Player. You can access the AppleCD Audio Player Guide from the Guide (question mark) menu, after you install and open AppleCD Audio Player.

Apple CD-ROM: Enables your computer to use an Apple CD-ROM drive.

Apple Color Printer: Enables your computer to print documents on an Apple Color Printer.

Apple Color SW Pro CMM: Contains color-matching information used by ColorSync 2.0 to maintain consistent color between documents.

Apple Guide: Adds Apple Guide functionality to your computer. Apple Guide is Apple's integrated onscreen help system.

Apple Photo Access: Part of the CD-ROM software for viewing Kodak PhotoCDs.

AppleScriptLib: Provides native support for AppleScript on PowerPC-based computers.

AppleScript: Enables automation of repetitive tasks in applications that support it.

AppleShare: Gives you access to shared disks on the network.

AppleTalk ImageWriter: Enables your computer to print documents on a networked ImageWriter II.

AppleVision Guide Additions: Adds step-by-step instructions to Macintosh Guide about how to use AppleVision displays with your computer. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Assistant Toolbox: This is the base extension for AutoRemounter. AutoRemounter works on Macintosh PowerBook computers and allows file synchronization, battery management, and easy mobile computing. It also provides support for a persistent RAM disk and deferred printing.

Audio CD Access: Lets you play audio CDs on your internal or external CD-ROM drive. Requires the AppleCD Audio Player or equivalent application to control the audio CD.

AV Guide Additions: Adds step-by-step instructions to Macintosh Guide about how to use AV monitors with your computer. You can access Macintosh Guide from the

Guide (question mark) menu when the Finder is active.

AV Setup: Used to control AppleVision displays.

Caps Lock: Enables Caps Lock on a Macintosh PowerBook. (PowerBook keyboards don't have a Caps Lock key.) When Caps Lock is turned on, an "up" arrow appears in the menu bar next to the Guide (question mark) menu. (Not needed on Macintosh PowerBook 500 series computers, which have a Caps Lock key.)

Clipping Extension: Lets you use the drag-and-drop feature to create clipping files on your desktop.

Color Picker: Presents a standard interface for color selection. Applications can use this tool to let you choose colors.

Color SW 2000 Series CMM: Color-matching information used by ColorSync 2.0 to maintain consistent color between documents printed on a Color StyleWriter 2000 series printer and other color devices.

Color SW 2400: Enables your computer to print documents on a Color StyleWriter 2200 or Color StyleWriter 2400.

Color SW Pro: Enables your computer to print documents on a Color StyleWriter Pro.

ColorSync: Matches colors on your display with the closest matching colors on your printers, scanners, and other devices.

EM Extension: Works with the Extensions Manager control panel, which lets you specify which extensions are turned on when you start your computer.

Energy Saver Guide Additions: Adds step-by-step instructions for using Energy Saver to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Ethernet (Built-In): Used by Open Transport to allow access to the built-in Ethernet port on your computer.

EtherTalk Phase 2: Lets you connect your computer to an Ethernet network.

File Sharing Extension: Enables your computer to share files and folders with other computers on your network.

Find File Extension: Lets you search for files and view the results in a single window. If you turn off this extension and choose Find from the File menu, you'll get the System 7.1 Find dialog box instead of the Find File window.

Finder Help: Provides Balloon Help support for the Finder.

Finder Scripting Extension: Allows you to use AppleScript to automate tasks in the Finder.

Foreign File Access: Enables your computer to work with CD-ROM discs whose

contents don't use the standard Mac OS file system (for example, ISO 9660 or High Sierra formats).

Graphics Accelerator: Provides video acceleration for the PCI video card.

High Sierra File Access: Part of the CD-ROM software that lets you view CDs with High Sierra file systems.

IIci/IIsi Monitors: Describes the capabilities of the built-in video card for the Macintosh IIci and IIsi. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

ImageWriter: Enables your computer to print documents on an ImageWriter or ImageWriter II connected to a serial port.

ImageWriter LQ: Enables your computer to print documents on an ImageWriter LQ connected to a serial port.

ISO 9660 File Access: Part of the CD-ROM software that lets you view CDs with ISO 9660 file systems.

LaserWriter: (version 7.2) Enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter 300: Enables your computer to print documents on a Personal LaserWriter 300, LaserWriter Select 300, or a Personal LaserWriter LS.

LaserWriter 8: (version 8.x) A PostScript level II print driver that enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter IISC: Enables your computer to print documents on a LaserWriter IISC connected to a SCSI port. Replaced by Personal LaserWriter SC.

LW Select 310: Enables your computer to print documents on a LaserWriter Select 310.

MacinTalk Pro: Lets your computer read text documents in human-like voices. Older computers (with 68030 or 020 processors) should use MacinTalk 3 instead.

MacinTalk 3: Lets your computer read text documents in human-like voices. Used by MacinTalk version 3. Computers with 68040 or PowerPC processors should use MacinTalk Pro instead.

Macintosh Guide: Contains step-by-step instructions for working in the Finder. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

MacTCP Token Ring Extension: Enables you to connect to a Token Ring network using TCP/IP protocol.

Mailbox Extension: Supports your PowerTalk mailbox. Enables the Mailbox icon to appear on your desktop.

Monitors & Sound Guide Additions: Adds step-by-step instructions for using the Monitors & Sound control panel to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

My Speech Macros: Supports the Speech Macro Editor.

Network Extension: Lets you set Personal File Sharing from the Finder.

Network Guide Additions: Adds step-by-step instructions for using your computer's network to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

ObjectSupportLib: A library developers use to support AppleScript on PowerPC-based computers.

Open Transport Guide Additions: Adds step-by-step instructions for using Open Transport to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Open Tpt AppleTalk Library: Used by Open Transport for the AppleTalk communication protocol.

Open Tpt Internet Library: Used by Open Transport for the TCP/IP communication protocol.

Open Transport Library: Used by Open Transport.

OpenTptAppleTalkLib: Used by Open Transport for AppleTalk communication protocol.

OpenTptInternetLib: Used by Open Transport for the TCP/IP communication protocol.

OpenTransportLib: Used by Open Transport.

PB 500 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 500 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 190 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 190 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 2300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 2300 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 5300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 5300 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Personal LaserWriter SC: Enables your computer to print documents on a Personal LaserWriter SC or a LaserWriter IISC.

Portable StyleWriter: Enables your computer to print documents on a Portable StyleWriter.

PowerBook Guide Additions: Adds PowerBook-specific topics to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PowerBook Monitors Extension: Describes the PowerBook built-in display. If you remove this file, your computer can still use the PowerBook video card and you can still select the number of colors your screen can display, but certain options (such as gamma settings) may not be available.

PowerPC Monitors Extension: Supports the AudioVision 14 monitor.

PowerTalk Extension: Supports PowerTalk services. Includes information used by the PowerTalk key chain.

PowerTalk Guide: Provides step-by-step instructions for using PowerTalk. You can access the PowerTalk Guide from the Guide (question mark) menu, after you install PowerTalk.

PowerTalk Manager: Manages your PowerTalk mailbox and services.

Printer Descriptions: Contains descriptions for all printers that use the LaserWriter 8 printer software.

Printer Share: Provides the ability to share non-network printers (for example, the StyleWriter II) across a network.

PrintMonitor: Controls the printing process when background printing is activated.

Quadra AV Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Centris AV computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

Quadra Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Macintosh Centris computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

QuickTime: Provides built-in multimedia support for applications.

QuickTime PowerPlug: Provides native support of QuickTime for PowerPC-based computers when used in combination with QuickTime 2.0. This extension must be used in addition to QuickTime 2.0.

QuickTime Musical Instruments: Supports 30 Roland Standard MIDI sound samples that can be accessed by QuickTime applications with no additional MIDI equipment.

Scripting Additions: Extends the AppleScript language with special features, such as finding the date or time of day. With scripting additions installed, AppleScript acts as if these features are part of the language. Scripting additions are required only when a script uses them.

Serial (Built-In): Used by Open Transport to allow access to the built-in serial port on your computer.

Shared Library Manager: Provides native support for Open Transport.

Shortcuts: Explains common keyboard equivalents and other shortcuts to use in the Finder. You can access Shortcuts in the Guide (question mark) menu when the Finder is active.

SimpleText Guide: Provides step-by-step instructions for using SimpleText. You can access the SimpleText Guide from the Guide (question mark) menu, after you open SimpleText.

Speech Guide Additions: Adds step-by-step instructions for using speech recognition to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Speech Recognition: Provides support for speech recognition.

SR Monitor: Used to monitor and interpret speech.

StyleWriter II: Enables your computer to print documents on a StyleWriter II. Replaced by StyleWriter 1200.

StyleWriter 1200: Enables your computer to print documents on a StyleWriter, StyleWriter II, or StyleWriter 1200.

SystemAV: Used for audio-video input.

System Speech Rules: Supports voices and speech dialects.

TokenTalk Phase 2: Used by the Apple Token Ring card.

TokenTalk Prep: Supports TokenTalk Phase II.

Tutorial Items: Provides instructions for learning basic skills on your computer. You can access the tutorial from the Guide (question mark) menu when the Finder is active.

Video Guide Additions: Adds step-by-step instructions for using video to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Video Startup: Used by the Apple Video Player.

WorldScript Power Adapter: Supports language kit software on PowerPC-based computers.

System 7.5 Update 2.0: What's Inside the System Folder? (7/96)

Revised: 7/3/96
Security: Everyone

System 7.5 Update 2.0: What's Inside the System Folder? (7/96)

=====

Article Created: 16 January 1996
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article contains one of several ReadMe documents installed with System 7.5 Update 2.0.

DISCUSSION -----

Macintosh System 7.5.3
What's Inside the System Folder?

About this document

If you're curious about the contents of the System Folder, this document provides a brief description of what's inside.

Depending on the type of computer you have, the contents of the System Folder may vary. You might have items that were added by third-party applications, and you don't need all the items described below.

Finder: Displays the desktop area, where you work with files and disks, and keeps track of your files.

Apple Menu Items folder: When you place an item (folder, application, or document) in this folder, it appears in the Apple menu. To create submenus, you can place folders inside of folders.

Clipboard: Temporarily stores the last item you cut or copied from a document.

Control Panels folder: Contains individual control panels. You use control panels to adjust your computer's settings. See the "About the Control Panels" document in the Apple Extras folder for more information.

Control Strip Modules folder: Contains modules used by the Control Strip. The

Control Strip works on Macintosh PowerBooks and Mac OS-based computers that support AppleVision displays.

Extensions folder: Contains individual extensions that modify the operation of your computer. Unlike a control panel, an extension works automatically, without your intervention. See the "About the Extensions Folder" document in the Apple Extras folder for more information.

Fonts folder: Contains font suitcases or individual font files. You can place up to 128 suitcase or font files in this folder. PostScript fonts are not included in the 128 file limit. Font suitcases can hold any number of font files, up to a limit of 16 MB.

Launcher Items folder: Contains files, folders, and applications that appear in the Launcher window.

Macsbug: A debugger used by programmers to help diagnose problems with programs, extensions, and so on. Unless you're programming, you don't need Macsbug.

Note Pad: Stores text placed on the Note Pad. (The Note Pad is available in the Apple menu.)

Preferences folder: Contains preferences files created by individual applications. A preference file determines application settings.

PrintMonitor Documents folder: Contains printer files of documents waiting to be printed (if background printing is on in the Chooser).

Scrapbook: Stores items placed in the Scrapbook. (The Scrapbook is available in the Apple menu.)

Shutdown Items folder: Contains applications or scripts that run automatically when you shut down your computer. You can add or remove items from this folder.

Startup Items folder: Contains applications or scripts that run automatically when you start your computer. You can add or remove items from this folder.

System file: Contains some system-wide resources, such as sounds and keyboard layouts.

Universal Enabler: Provides additional system software for your computer.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

PowerShare: Error Code 83 Meaning (1/96)

Revised: 1/16/96
Security: Everyone

PowerShare: Error Code 83 Meaning (1/96)

=====

Article Created: 16 January 1996

TOPIC -----

This article describes what the PowerShare error code 83 means.

DISCUSSION -----

The PowerShare error code 83 is an internal error: rServerNumbersSame. Somehow two replicas of the Folder Directory (dNode #2) are using the same server number (which forms the top half of creationIDs). This is a bad error which causes the replication between the two replicas to fail.

To fix the error, a user should remove the copy of the folder directory from the server reporting the error. Then re-create the copy once the server log indicates that the removal has completed successfully.

Newton 2.0 OS: New Modem Setup Choices (1/96)

Revised: 1/17/96
Security: Everyone

Newton 2.0 OS: New Modem Setup Choices (1/96)

Article Created: 17 January 1996

TOPIC -----

There are several different modem setups available in the Newton 2.0 OS preferences. What kinds of modems are they for and how do they compare with the modem setups included with previous Newton Modem Enabler 1.0?

DISCUSSION -----

There are eight different choices for modem setups in the Newton 2.0 OS. The different setups are described below. If the setup had a different name in the Newton 1.x OS, it is listed after the description. New setups are also labelled after the description.

- Newton Modem -- For use with the either the external Newton modem or the PCMCIA Newton modem.
- Moto Cellular -- For use with the Motorola CELlect PCMCIA and Motorola CELlect pocket modems connected to any data-capable Motorola MC2 Microtac cellular phone. Connection speed is locked to 4800 baud. Formerly MotoCELlect Cellular in the Newton 1.x OS.
- Moto Cellular Fast -- Same as above but connection speed is 9600 baud. New for Newton 2.0 OS.
- Moto Landline -- For use with the Motorola CELlect PCMCIA and Motorola CELlect pocket modems connected to standard telephone lines. Formerly MotoCELlect 14.4 in the Newton 1.x OS.
- Hayes 28.8 -- For use with Hayes compatible 28.8 modems. New for Newton 2.0 OS.
- Hayes EC -- For use with modems (including Hayes brand modems) that implement the complete Hayes command set. Formerly Hayes Error-Correcting in the Newton 1.x OS.

- Hayes Compatible -- For use with the majority of other modems that implement the basic Hayes commands, but use a different set of commands for configuring features, such as error correction and flow control.
- Hayes Basic -- For use with Hayes compatible modems that do not support features such as error correction or data compression. This setup can also be used when the other Hayes setups fail. New for Newton OS 2.0.

Apple Media Tool 2.0: Runtime For Windows No Sound Card (1/96)

Article Created: 17 January 1996

TOPIC -----

How can I create a Runtime for Windows in Apple Media Tool 2.0 that will work on a computer that does not have a sound card?

DISCUSSION -----

How To Edit The PROJ.INI File

The below file is the PROJ.INI file that is created with Runtime Maker 2.0 that can be opened with SimpleText and edited in the following way:

Step 1

Find ;REQUIRE SOUND=yes or no.

Step 2

Remove the semicolon - that is a comment.

Step 3

Put No after the = sign and save the file.

Contents Of The PROJ.INI File

The PROJ.INI file contains this information:

```
[Media]
;Media Folder=
;TRANSPARENCY=driver or bitmap
```

;REQUIRE SOUND=yes or no

[FONT]

Chigago=System

Courier=Courier New

Geneva=Arial

Helvetica=Arial

PowerBook 5300 Series: Wide Black Bands on the Screen (1/96)

Revised: 1/17/96
Security: Everyone

PowerBook 5300 Series: Wide Black Bands on the Screen (1/96)

=====

Article Created: 17 January 1996

TOPIC -----

Why are there two wide (about 1/4 inch) black bands (borders) across the top and bottom of my PowerBook computer's display? I can still see the menu bar and the Trash.

DISCUSSION -----

There are two cases where black bands can occur on the screen of PowerBook 5300 computers as you describe.

1) A Macintosh PowerBook 5300c computer with 512K of Video RAM (VRAM). The model that comes with 8 MB of RAM on the Logic Board does have the same display as the 5300c which has 1 MB VRAM, so it will display thousands of colors. When "Thousands" are checked in the monitor control panel, the display reduces from 640x480 to 640x400 just like on the PowerBook 540c, 270c, and 2300c computers. This causes black bands on the top and bottom of the screen.

2) A Macintosh PowerBook 5300ce computer used with a 13" or 14" monitor. If mirroring is turned on, the internal display will have to reduce from 800x600 down to 640x480 and will cause a black band to appear around the outside edge of the screen.

Newton 2.0 OS: Cannot Backup System Update (1/96)

Revised: 1/17/96
Security: Everyone

Newton 2.0 OS: Cannot Backup System Update (1/96)

=====

Article Created: 17 January 1996

TOPIC -----

Sometimes when I do a card backup on my Apple MessagePad 120 running Newton OS 2.0, it fails with a message that says, "The system update could not be backed up."

DISCUSSION -----

This is a known issue relating to memory management. If you experience this error message, you can simply reset the Apple MessagePad and then do the backup after the card is mounted.

How to Reset the Apple MessagePad

=====

You need to perform a "soft" reset. A Soft Reset resets the Newton OS. It does NOT erase any data or handwriting training on the Apple MessagePad. However, you should check the Time in the Date and Time Prefs preferences file. The clock in the Apple MessagePad may lose some time when you press the Reset button.

Step 1

Press and release the Reset button in the battery compartment for two seconds.

Step 2

If the Apple MessagePad is on, it restarts itself. If the Apple MessagePad is off, it turns itself on.

The MAE Desktop and the Finder

=====

Support for MacsBug, Drag and Drop

Both MacsBug (a popular tool for debugging Macintosh applications) and Drag and Drop (a utility to assist Macintosh application launching) are not supported under MAE. Attempts to use either of these applications will have unpredictable results.

Distributing Common Extensions, Control Panels, Preferences, etc.

When MAE is started for the very first time for a particular user, it creates a

System Folder in the user's \$HOME directory by copying the files located in apple/sys directory. These system files can then be customized by the user to suit their particular MAE environment. If numerous users will be utilizing the same mail application, meeting planner or other productivity application, it is likely that one or more files will need to be added to their System Folder. By adding these files (typically Extensions and Control Panels) to the apple/sys directory (in their respective folders), a new System Folder can be created for each new user that already contains the necessary files. This way, only the application may need to be copied to the user's \$HOME directory. In a similar fashion, you can distribute preset Preferences files as well. Note that this method of distributing common resources does not populate existing System Folders.

For example, you might wish to place all the necessary Extensions and Control Panels in the apple/sys directory for a network-based mail application, and include the Preferences file for that application. This would ensure that the user already had the proper name and location of the mail server as well as any additional system resources required by the application.

Using Global Fonts to Minimize Disk Usage

By default, MAE users do not share their individual Fonts directories. Since each user must be able to modify the directory (for both adding and deleting fonts), management of the Fonts directory as a modifiable shared resource would be difficult. As an alternative, have the system administrator create a globally accessible Fonts directory which is read-only and allow only the superuser to add or delete fonts. In this manner, the directory can be populated with many fonts that would otherwise be duplicated for each user, thus preserving more disk space. Once this has been done, each user can delete their private Fonts directory and create a symbolic link to the shared Fonts directory (using `ln -s').

Icon Placement When Resizing Windows

Whenever the display window for the MAE desktop is resized, all icons are aligned on the right side of the window. The Trash will be moved to the lower right corner and the startup drive (which always appears as "/" in MAE) will appear on top. Any other icons, including the user's home directory, are placed below and to the left of the startup drive. To avoid the loss of any custom icon placement you can iconify MAE if more workstation desktop space is desired.

Flashing Menu Bar After Exporting to X

If text is selected from an open application such as "Note Pad" and exported to X (using the "Export to X" key from the MAE toolbar), the Finder menu bar may flash or disappear when returning focus to MAE. If this happens, clicking on the Macintosh Desktop within MAE will restore the menu bar.

Rebuilding the Desktop

If MAE is started with the -rebuild option, MAE will search for files in the System Folder and appledir. If you have applications and documents that are not in these directories, they will revert to generic icons until they are used

again by the Finder. This is different from native Macintosh behavior and was implemented to prevent MAE from potentially trying to resolve icons for multiple remotely-mounted file systems, which could take a great deal of time. However, you can put symbolic links into a directory of your choosing and have those file systems searched during a Desktop rebuild. To do this, start MAE with the `-applepath <dir>` option, where `<dir>` is the full pathname of the directory. For example, if your symbolic links are located in a directory whose path is `/usr/joe/rebuild`, you can start MAE with

```
mae -rebuild -applepath /usr/joe/rebuild
```

Files that are contained within folders that have been assigned a label from the Finder (for example, "Hot") will revert to an unlabeled state when the Desktop is rebuilt. This behavior does not occur with files that are located on the Desktop itself.

Creating Aliases by Dragging Files to the MAE Desktop

When you drag an item to the MAE desktop, MAE creates a Macintosh alias to the item; the item itself remains in its original location. The name of the alias is the name of the original item plus the word "alias"; it is displayed in italics. For example, if you drag a file called "My.file" to the desktop, MAE creates an alias called "My.file alias." You can open the original item by double-clicking its alias on the desktop. If you delete the alias by dragging its icon to the Trash, the original item is not deleted. (For more information about aliases, see "Creating an Alias" in the MAE USER'S GUIDE, Appendix A.)

Aliases themselves are treated no differently from other items; dragging an alias to the desktop creates an alias to the alias to appear on the desktop. For example, if you drag an alias called "Status.report alias" to the desktop, MAE creates an alias called "Status.report alias alias."

Because this treatment of aliases differs from standard Macintosh procedure, it can confuse experienced Mac users. For example, in a Macintosh, to bring an alias of an item to the desktop, you select the item, make an alias using the MAKE ALIAS entry in the finder's FILE menu, then drag the alias to the desktop. The same sequence of events in MAE causes a second-level alias to appear on the desktop, and leaves the first-level alias in the same folder as the original item. The alias on the desktop appears to function normally, but it actually refers to the first-level alias, not to the original item. If you delete the first-level alias ("Status.report alias"), you will no longer be able to use the second level alias on the desktop ("Status.report alias alias") to refer to the original item.

Aliases and Multiple UNIX File Systems

If an item that is the target of an alias is moved to a different file system, the linkage between the alias and the original item is broken; double-clicking the alias will no longer open the original item. MAE displays an alert box, telling you that it cannot locate the original item. For example, if you create an alias to a file located in `/usr`, and then drag the file to your home directory, MAE won't be able to open the file when you double-click its alias. Similarly, if you select the alias, choose Get Info from the File menu, and

click the Find Original button, MAE displays an alert box, telling you that the command could not be completed because the original item could not be found.

If the Message "~ not found" Appears When You Launch a UNIX Command

MAE allows you to add options and arguments to a UNIX command when you launch the command from the MAE desktop. When you hold down the Control key while you double-click a UNIX file, the command-launch dialog box appears. You can add options and arguments to the command by typing them in the command-launch dialog box. (See "Adding Command Options when Opening a UNIX Command File" in the MAE USER'S GUIDE.) However, some special symbols commonly used in UNIX commands are not treated by MAE in the same way they are in UNIX, and should not be included in the command-launch dialog box. These include the tilde (~) character and environment variables such as \$HOME.

Changing the Font Size on the Desktop

Use the Views Control panel to select the size of the desktop font used for filenames.

Find File

The Finder's Find File utility may find the same file more than once if it traverses symbolic links. Because it reports the actual path, rather than the symbolic path, you may see items repeated with the same pathname.

Remote mountpoints will be searched by the Finder's Find File utility, even though the option in that utility says "Find items on Local Disks". MAE treats all UNIX mount points as local. The "mounted servers" option refers to AppleShare servers mounted via the Chooser.

File System

=====

Application Location for Optimal Performance

To obtain the best possible performance from your Macintosh applications with MAE, you can place all applications in one central directory on a local disk. By doing this, you will decrease the time it takes to load the application into memory, as applications located from remote volumes will be subject to network performance. Even if you are not able to store the applications locally, placing them in a single directory will enable MAE to better associate documents with their creator applications. This is performed the very first time MAE is launched, and is referred to as 'rebuilding the desktop.' For more information on this strategy (and usage of the '-applepath' command line switch), please refer to Tech Note #2, available via FTP or via WWW.

File Type of UNIX Files

An MAE Get Info operation on a UNIX file, either a text file or a binary file, shows the type of file as "MAE Helper Document". This is normal MAE behavior, to support UNIX file launching.

How does MAE handle case-sensitive MAE file names?

MAE has two modes of treatment for file names:

- Case-insensitive (the default mode).
- Case-sensitive, selected by the -caseon option on the MAE command line.

In the default (Case-insensitive) mode, MAE behaves like a Macintosh. The file name "a" is treated the same as the file name "A". If you have a file named "a" and try to save a new file named "A", MAE will ask you to confirm that you want to replace the file, as in MacOS. If two UNIX files "a" and "A", are in the same directory, MAE will see only one of them.

When MAE is executed with the -caseon option, file name treatment is case-sensitive. The files "a" and "A" are treated differently. You can have both a file named "a" a new file named "A" in the same directory. Both files will show up in the Standard File dialogs.

Because the determination of case sensitivity is happening at the lowest level of the file system, the Finder and all applications share the file view described above.

Installation onto AFS filesystems (HP)

On HP-UX systems, MAE installation may fail with the error message "Read-only filesystem". Also, a bug in the MAE installer is sensitive to extremely large AFS file systems.

A simple workaround to circumvent these difficulties: install MAE on a local or NFS volume, then copy the entire result - the apple directory, and the System Folder and .mac folders, if they exist - to AFS.

AppleSingle and AppleDouble File Formats

By default, MAE stores files in the UNIX file system in a format called "AppleSingle", which is unlike MacOS files, which have both resource and data forks. In AppleSingle-format files the resource fork information is prepended to the data fork, creating one file -- a larger file that you see in UNIX.

This explains why using MAE to copy files from a CD or from network-based volumes can result in source and destination files of different sizes, as viewed by the UNIX file system.

If this behavior is unacceptable, you can force MAE to default to saving files as AppleDouble by adding the -filedouble option to the MAE command line. This forces MAE to keep MacOS files as separate data and resource forks. From MAE, it will appear as one file, but within UNIX, you will see a file name 'name' (data fork) and '%name' (resource fork). The file 'name' will then be the same size in UNIX as the Finder reports.

Also, UNIX applications may fail to recognize MAE AppleSingle files, because

they see them as corrupted. This "corruption" can occur in a number of different ways. For example, under FileShare, if a UNIX file is dragged from a Macintosh to MAE, the file will be written by MAE in AppleSingle format, which may make it unusable. This occurs because the Macintosh doesn't know anything about UNIX files, so when it sends one to MAE, MAE thinks it's a Macintosh file and writes it to disk accordingly.

This situation does not occur between two MAE sessions that are sharing files, since MAE recognizes UNIX files for what they are and does not store "resource" information about them. When dragging a UNIX file between two MAE sessions, MAE correctly treats the file as a UNIX file.

Using ftp utilities such as Fetch from MAE can also be problematic. When "getting" a file, Fetch will pass the file to MAE to be written to disk. This works fine for Macintosh files since they will be written as AppleSingle files. However, when "getting" a UNIX file, MAE will likewise write this file as an AppleSingle file, which can make it unusable by UNIX applications.

Text files are handled differently by MAE. Text files are always written by MAE in AppleDouble format to facilitate reading and writing by both Macintosh and UNIX applications (newline characters are automatically translated by MAE; they are stored on disk as UNIX newlines). So in the examples above, when dragging a text file from a Macintosh to MAE or when Fetch gets a file using ftp "Text" mode (that is, ASCII mode), MAE will write the file in AppleDouble format.

NOTE: Fetch 3.0 and higher will not work with MAE 2.0.2, use version 2.x.x.

As a rule of thumb, it's best to use UNIX to work with UNIX files and MAE to work with Macintosh files. If your environment requires the same (non-text) files to be regularly handled by both MAE and UNIX, then you're probably a candidate for running MAE in AppleDouble mode, by launching it with the -filedouble option.

If this behavior is unacceptable, you can force MAE to default to saving files as AppleDouble by adding the -filedouble option to the MAE command line. This forces MAE to keep MacOS files as separate data and resource forks. From MAE, it will appear as one file, but within UNIX, you will see a file name 'name' (data fork) and '%name' (resource fork). The file 'name' will then be the same size in UNIX as the Finder reports.

Space for /users (HP)

On HP Series 700 workstations the capacity of /users may need to be increased to provide space for an MAE System Folder for each user. When this necessitates the creation of a new file system, the new file system must support long file names.

The process below copies the contents of /users to a new MAE-compatible file system:

- Log on as superuser
- If /users is a MOUNTED FILE SYSTEM, create a new mount point /users.temp

and remount /users on /users.temp. If /users is IN THE ROOT FILE SYSTEM, change the name of /users to /users.temp by using the command

```
mv /users/users.temp
```

- To create a new file system, start SAM (System Administration Manager) by typing the command

```
sam &
```

- Use SAM to perform these steps:

- 1) Select "Disks & File Systems" -> "CD-ROM, Floppy and Hard Disks"
- 2) Select the new SCSI Drive, highlight 'Action' and select 'Add a Hard Disk'
- 3) Select 'Modify Defaults' and select "Use Long File Names" (See NOTE)
- 4) Select OK and mount the new File system to /users
- 5) exit SAM

NOTE: The "Use Long File Names" option results in a file system that will support file names longer than 14 characters. The SAM default supports file names only up to 14 characters, and prevents MAE from properly creating long Macintosh file names on that file system.

- Now copy the contents of /users.temp to the new file system as follows:

```
cd /users.temp  
find . -print -depth | cpio -pdumv /users
```

- Before proceeding, verify that the contents of /users are the same as the contents of /users.temp.
- If /users.temp is a MOUNTED FILE SYSTEM, unmount it. If /users.temp is IN THE ROOT FILE SYSTEM, remove it with the command

```
rm -rf /users.temp
```

Networking

Selecting AppleTalk Zones

Under some circumstances, a user of MAE may not be able to select a different default AppleTalk zone even though there may be others available. For example, if two or more copies of MAE are executing on the same physical workstation, none of the MAE users will be able to change zones. Another possible scenario is that AppleTalk has not shut down properly (that is, it was still up even after all copies of MAE were shut down). To ensure that AppleTalk is not currently running, execute the command ``appletalk -D'`. (For more information on usage of the ``appletalk'` command, reference the next topic.)

Using the `appletalk' Unix Command

As part of the MAE v2.0 distribution, Apple includes a utility to assist in management and diagnosis of problems with the AppleTalk services that are part of MAE. With this utility you can stop or start AppleTalk services independent of MAE, as well as obtain detailed information on the AppleTalk services currently executing on that workstation. For more information, reference Chapter 5 of the `MAE System Admin Guide', a DocViewer document included with your CD-ROM distribution of MAE.

(Sun only) File Modes For Non-le0 Interfaces

By default, device drivers used for LAN interfaces under Solaris are designated as read-only for the superuser (root). As MAE allows any non-privileged user to bring up AppleTalk (which is normally done the first time MAE is started on each workstation), it is necessary that the file permissions be changed to world-readable. The MAE v2.0 installation script automatically changes the permission for the device `le0'; all others need to be made world-readable before MAE will be able to use those devices.

Personal File Sharing and MAE

For some system administrators, providing MAE users with the capability of sharing Unix directories via AppleShare File Sharing may present a possible security risk. To prevent this from happening, remove the file named `File Sharing Extension' from the Extensions folder located inside the apple/sys directory. Now, when the System Folder for the new user is created, the Extension will not be present. This will prevent the user from sharing directories on the workstation.

Remote (Network) File System Performance and Timeouts

When a user's System Folder or Apple directory (appledir) resides on a network file system (for example, NFS), performance will be affected by the configuration and by the loads on the file servers involved. In some cases, this affects MAE behavior. For example, to avoid "hanging" forever because of communication failure with an NFS host (a problem in MAE 1.0), MAE v2.0 periodically reviews ongoing file operations and will abort any file system operation that loses communication for a specified threshold time (called the "File System Timeout"). This timeout is ten seconds by default. This means that if MAE waits for a response from an NFS-mounted file system for more than the timeout, MAE gives up on the access and returns failure. If the operation is non-critical (for example, a directory listing), MAE treats that file system as inaccessible. If the access is critical to MAE's operation (such as the Finder) then MAE will hang.

In configurations with heavy network traffic (resulting in slow network response), MAE's default timeout setting may be too short. If so, you may see an error such as "... because the disk `/' cannot be found." Using the -fstimeout option at startup will increase the amount of time that MAE will wait before giving up on a remotely-mounted filesystem and help to prevent MAE from hanging. For example, you can start MAE with the command `mae -fstimeout 30' which sets the timeout to 30 seconds. This value should be sufficiently high for networks

where response time is variable due to heavy loads. If -fstimeout is set to 0, the heartbeat function is disabled and MAE will wait indefinitely for a remote file system (this is identical to MAE v1.0).

If network response time is still affecting the performance of MAE after you increase the value of -fstimeout, consider putting the System Folder or Apple directory (appldir) on a local volume.

Appletalk Options

The following AppleTalk command options are missing from the man pages:

appletalk - enables you to configure and display AppleTalk network interfaces

-b hardware-interface Identifies the hardware interface that EtherTalk is to use. The value of hardware-interface is a string, such as le0 through le9 for Solaris, lan0 through lan9 for HP-UX, that identifies the Ethernet hardware on a computer that has more than one Ethernet card. This option must be used with the -u option. The default hardware interface is le0 for Solaris and lan0 for HP-UX. Only interfaces 0 through 9 are supported.

-u Makes AppleTalk active and stores the state of AppleTalk in PRAM. AppleTalk will stay active until an appletalk -D is issued.

(Sun only) Unloading AppleTalk streams modules on Solaris systems

On Solaris systems, the AppleTalk stream driver 'atalk' and three other AppleTalk stream modules, 'at_atp', 'adsp' and 'at_sig', are dynamically loaded into the system when MAE starts up. The driver and the modules will not be unloaded until the workstation is rebooted. If a 'modunload' command is issued on any one of the stream module, it will cause the system to crash.

Problems posting articles or sending mail using NewsWatcher

Users are able to browse and select news groups to read, but are unable to post. This is due to an incompatibility between NewsWatcher and MAE 2.0.

MacTCP Ping

MacTCP ping does not work correctly on HP-UX and Solaris. As a workaround, use the UNIX 'ping' command.

Floppy Disks and CD-ROMS

=====

(HP only) Using Older (Single Speed) CD-ROM Drives

There may be a problem using older HP CD-ROM drives (single speed Toshiba XM-3301TA) in conjunction with an HP Model 715 workstation. Typically, this is manifested as a problem where MAE cannot mount a CD-ROM. HP's Support Center has verified that there is a known SCSI timing problem when the older drives are

used with a Model 715. As a workaround, HP has suggested either (1) another SCSI device is placed between the 715 and the CD-ROM player, or (2) usage of a SCSI cable greater than one meter and less than six meters.

MAE and Microsoft Office

Microsoft has instituted a new diskette format (known as DMF -- Distributed Media Format) that permits distribution of software on a smaller number of diskettes. This is accomplished by using a format of 1.6M which cannot be used by current PC-compatible (360K/720K/1.4M) or Apple (400K/800K/1.4M) floppy drives unless read by the installer program. The special installer modifies the hardware floppy driver to support the new format. MAE does not use standard Macintosh drivers to support floppy drives. As a result, the installer cannot be run from disks that support DMF.

To properly install MS Office for use with MAE, you can do one of the following:

- 1) Install from a CD
- 2) Install from a diskette set that does not use DMF
- 3) Install using a DMF diskette set onto a native Macintosh and use AppleShare to transfer the files to MAE.

When running the install, select a new folder when asked to specify the directory for installation. The directory created will then be the installation folder, and the install will proceed normally. Lastly, when asked to update Excel graphs, select 'No.'

(Sun only) Problems Using MS-DOS or Solaris File System Disks on MAE

If you insert a floppy disk formatted for MS-DOS or Solaris into a Sun workstation and try to mount it in MAE by clicking the Mount Floppy/CD button, MAE displays an alert box. The alert box appears because Solaris mounts the floppy disk before MAE has the opportunity to mount it. Thus, MAE is not able to access the floppy disk. (The icon for the floppy disk appears on your Solaris desktop.) As a result, you can not reformat MS-DOS disks as Macintosh disks, and can not use them on the MAE desktop. You have several options for dealing with this situation. If you want to use the files on the disk, the contents of the disk will show up as UNIX files in /floppy in your Solaris file system. If you don't want to use the files on the disk, and you want to format it as a Macintosh disk, you can eject the disk, insert it into a Macintosh computer, and reformat it as a Macintosh disk using the Macintosh computer. If you don't want to use the files on the disk, and you want to format it as a UNIX disk, you can try to reformat the disk on a UNIX workstation that is not running the Solaris File Manager.

(Sun only) If you cannot access the files on an MAE CD mounted remotely on a Sun workstation

You may have a problem accessing the files on a remotely-mounted MAE CD-ROM disc if the disc was mounted on a Sun workstation by using the Solaris Volume Manager. There are two possible solutions to the problem:

1) You can quit the Solaris Volume Manager and explicitly mount the MAE CD-ROM disc by using a command such as mount(1). You should then be able to access the files on the CD-ROM disc in order to perform a remote installation.

2) You can copy the MAE files from the CD-ROM disc to a directory on the Sun workstation and then access the files by remotely mounting the directory. For more information about remotely installing MAE, see Chapter 1 in the MAE USER'S GUIDE.

(Sun only) If the Message "fd0: read failed" Appears

When you try to mount a floppy disk on MAE, you may see the message "fd0: read failed" on your Sun console. This message alerts you that Solaris is unable to read certain sectors on the floppy disk. Try another floppy disk, or try the same disk on a different workstation. (If the disk does not contain data that you need, you may want to reformat the disk, and then try mounting it again with MAE.)

(Sun only) If MAE Displays an Alert Box about the Solaris Volume Manager

When you try to mount a floppy disk in MAE running on a Sun workstation, MAE may display an alert box that contains the message: "You will not be able to use Macintosh floppies with MAE because the Solaris Volume Manager is not available now." If this alert box appears, use the ps (1) command to see if the process "vold" (/usr/sbin/vold) is running on your workstation.

If "vold" IS NOT running, start the "vold" process as the root user and try mounting the floppy disk again. (You may want to edit the appropriate Solaris configuration files so that "vold" starts automatically when you start up your workstation. For instructions, see the Solaris documentation.)

If "vold" is running, and you see an error message such as "/dev/volctl: Permission denied" on your console, the problem is with Solaris. As root, check the access permissions on the file named in the error message (for example, /dev/volctl). If necessary, change the permissions for the file by using the chmod (1) command and give yourself access to the file. (If the file is a symbolic link, you will need to change the access permissions on the file to which the link points.) After changing the access permissions, try mounting the floppy disk on MAE again.

(Sun only) Unable to access the floppy drive

Be certain the permissions on the floppy device file symlinked to /dev/rdiskette are readable and writable by you.

In addition, software products that do not currently support the Solaris Volume Manager will conflict with MAE, which does use the Volume Manager. Until software products that are incompatible with the Volume Manager are upgraded to support it, you can work around this conflict by turning the Volume Manager on when using floppies or CDs in MAE and off when using other software. This work-around is only necessary when accessing a Macintosh floppy or CD since MAE doesn't use the Volume Manager until you try to access a Macintosh disk. Beware, too, that some software disables Volume Manager control at the device level by

changing your /etc/vold.conf file, rather than starting or stopping the Volume Manager's vold process.

(Sun only) If Solaris Displays the "Unlabeled Floppy" Dialog Box on Your Console

When you insert and try to mount a Macintosh floppy disk on MAE, Solaris displays the "Unlabeled Floppy" dialog box if you didn't install the Solaris Volume Manager Extensions when you installed MAE. (See Chapter 1 of the MAE USER'S GUIDE for more information.) Click Cancel in the dialog box (do NOT click Cancel & Eject). The floppy disk icon should appear on your MAE desktop. To avoid this problem, you should eject disks that have been mounted on the MAE desktop by using MAE capabilities only. For example, drag the disk icon to the Trash or choose Eject Disk from the Special menu.

(Sun only) If MAE Hangs When a Mounted Floppy Disk Has Been Ejected

If a Macintosh disk is somehow ejected without MAE being notified (for example, by typing "eject floppy" in a Solaris shell window or by clicking Cancel & Eject in the dialog box described earlier), MAE may hang until it is able to use the disk again. Reinsert the disk and type "volcheck" in a Solaris shell window. This step should allow MAE to continue to use the floppy disk on the MAE desktop. To prevent this situation, run the MAE Installer as root and install the Solaris Volume Manager Extensions package (according to the instructions in "Macintosh Application Environment: Installing and Setting Up").

(Sun only). If You Have Problems Using MS-DOS (Including Windows) or Solaris File System Disks on MAE

If you insert a floppy disk formatted for MS-DOS or Solaris into a Sun workstation and try to mount it in MAE by clicking the Mount Floppy/CD button, MAE displays an alert box. To use MS-DOS files on MAE running on Solaris, use the capabilities provided by Solaris. (For example, do not use Macintosh PC Exchange or other Macintosh applications that read MS-DOS disks.)

Follow these steps:

- 1) Insert the disk that contains the MS-DOS files that you want to use.
- 2) In a Solaris window, type "volcheck floppy". The files on the disk will appear in the /floppy/<floppyname> directory on your UNIX file system.
- 3) To use the files on the MAE desktop, double click /, then double-click the folder called "floppy," and then double-click the folder called "<floppyname>."

Problems Using Floppy Disks Remotely

Although Some X Terminals export floppies as NFS file systems, thus providing a convenient workaround, MAE does not in general provide remote floppy support . For example, you can start MAE on a workstation and display it remotely (using the -display option) on another workstation on the network. If you display MAE remotely, you can use only floppy disks that are inserted in a floppy drive

attached to the workstation where you started MAE, not where you are displaying it.

Floppy drives and performance

Floppy drives are much slower than hard disk, and leaving a floppy in an Xterminal drive can slow down MAE. Since MAE periodically scans the directory(ies) which are displayed in open Finder windows, leaving a floppy in the drive when the Finder has your home directory displayed in a window will effect performance. Solution: don't leave floppies in the Xterminal's drive.

(HP only) Floppy drives on HP "Envizex" Xterminals

Some HP "Envizex" Xterminals come with floppy drives. MAE is not able to directly access floppies in these drives: the Xterminal software, in cooperation with the host UNIX system, controls the hardware. MAE has no way to load executable code into the Xterminal to control the device without changing the operation of the drive. Thus, only MS-DOS floppies are accessible through the Xterminal's floppy drive. They are mounted by the host system software via NFS, and are accessable as \$HOME/floppy. If you are having problems using the floppy drive, contact your system administrator, or consult HP's documentation (for example, "HP ENWARE X Station Software 5.1, Technical Reference", chapter four "Using the X Station's Hardware Accessories").

MAE produces spurious dialog boxes when MOUNT button is pressed

Launching an application and then IMMEDIATELY clicking on the MOUNT button on the MAE Toolbar, with a valid MAE floppy in the drive, can cause various spurious dialog boxes to appear in the MAE window. If this happens, wait for the application to finish launching, then press the MOUNT button again. Dismiss the remaining dialog boxes.

(Sun only) MAE hangs when MOUNT button is pressed

If MAE seems to hang just after you click on the "mount" button in the toolbar, with a valid MAE floppy in the drive, type the following in a Solaris shell window:

```
volcheck floppy ; eject ; volcheck floppy
```

This should unstick the Solaris Volume Manager, and allow you to continue.

Printing

=====

MAE's support for UNIX printers is very general; it is designed to work on a wide variety of workstations and system types. This flexibility makes it impossible for MAE to troubleshoot every possible printing configuration. Chapter 4 of the MAE USER'S GUIDE, "Printing in MAE," gives a comprehensive description of techniques related to printing. This section lists some commonly-encountered printing errors. If you encounter a printing problem that is not covered, your system administrator should be able to help you.

How to Cancel Printing (Sun and HP)

When you print a Macintosh file on MAE, a printing status dialog box appears for several seconds (depending on the size of the file). While the status dialog box is on the screen, you can cancel printing by holding down the Command key and pressing the period (.) key until the "canceling printing" dialog box appears. To cancel printing after the status dialog box has disappeared, use UNIX commands, such as `lprm(1)` or `cancel(1)`. For more information, see the appropriate manual pages (man pages) that came with your workstation or consult your system administrator.

If the Printer Does Not Print Anything

Check the X window in which you started MAE. MAE will display any error or status messages in the window. The error messages can provide useful information about why printing isn't working. Also check the following:

- 1) Verify that the printer is turned on and properly connected to the network. (For example, check for loose connections.)
- 2) Verify that UNIX printing has been configured correctly on your workstation.
- 3) Verify that you have correctly set up a print command by using the Chooser (available in the Apple menu on the MAE desktop). For example, make sure that you did not accidentally type the wrong printer name in the Setup Print Command dialog box. For information about setting up a print command, see Chapter 4 in the MAE USER'S GUIDE.
- 4) Be sure you are looking for the printout at the correct printer. You may have recently changed the print command to print to a different printer, or the default UNIX printer may have changed. Some workstations use a UNIX environment variable to specify the default printer. If the environment variable has been changed, or if you are running MAE on a different workstation, you may be printing to a different printer without knowing it. (For this reason, the "MAE USER'S GUIDE" recommends that you specify a particular printer when you set up a print command.)
- 5) Verify that the print queue contains your print request. Use `lpstat` or `lpq` to check status. Also make sure that the print spooling system isn't jammed.
- 6) Verify that the print command that you specified in the Chooser actually works if you type it directly into a UNIX command window. This step lets you know whether your UNIX printing is working correctly.
- 7) Try printing the same file to another printer. This step helps you determine whether the problem resides with the spooling system or with a particular printer.
- 8) Try printing the file a second time, but this time click the Options button in the Print dialog box and choose "Print detailed report" in the PostScript Errors pop-up menu. This option prints any PostScript errors that may have occurred. You can also print a cover page before

printing the file. (Select the "Before" radio button in the dialog box.) If the cover page prints, you will know that the file is making it to the printer.

The Printed Page Contains "%!PS-Adobe-3.0" and Other Miscellaneous Text

Sometimes when you print a file, the page contains "%!PS-Adobe3.0" followed by other miscellaneous text. This means that the PostScript program is being printed as text, instead of being executed as code. This situation may occur if you are trying to print your file on a non-PostScript printer. (If this is the case, try printing your file on a PostScript printer.) The situation also may occur if your UNIX printing does not recognize the PostScript identifier "%!PS-Adobe-3.0," which appears on the first line. See your system administrator for help.

Only part of your document was printed

Printing can generate large PostScript files. If you do not have enough free disk space, only a portion of your document may be printed.

Keyboard and Display

=====

Dynamic Screen Resizing and Application Windows

A popular feature of MAE is the ability to dynamically resize the X11 window (and thus, the Macintosh Desktop) while it is active. When resizing occurs, MAE sends an AppleEvent to all active applications indicating that the Desktop size has changed. Some older applications do not support this AppleEvent and will continue to behave as though the Desktop were the same size as when the application was launched. Apple DocViewer, which is supplied with MAE v2.0, is an example of an application that does not presently handle this AppleEvent.

Colormap Sharing Between MAE and X Applications

If "Map X Windows to MAE palette" is enabled from within the "MAE General" Control Panel, MAE will try and share as many colors as possible with other X applications. If an X application modifies an entry in the colormap that is being shared with MAE, you may see a temporary change in how that color displays within MAE. To prevent this from happening, change the selection in the "MAE General" Control Panel to "Allow colormap flash" and reboot. This will cause a color "flash" when changing focus between MAE and other X windows but preserves the colormaps for each environment.

Modifier Map Sharing Between MAE and X Applications

Every keystroke that occurs in an X environment is inspected by X so that it can catch the keystrokes that invoke X operations. To accomplish this, the X environment uses a "modifier map" -- a keyboard translation table.

While the X window containing MAE is the active window, MAE modifies this keyboard map, so that keystrokes meaningful to MAE are passed to MAE by the X

environment for processing, even if they would normally have meaning to the X environment itself. This means that while MAE is active, keystrokes are processed as specified in the 'MAE Keyboard' Control Panel. For example, if the <META> key is mapped to the MAE <Command> key, the X environment will pass on to MAE those <META> keystrokes that occur MAE has focus. Typing Meta-Q in the MAE environment will therefore quit a Macintosh application even though Meta-Q would normally be interpreted by the X environment as a CLIENT_KILL (which would terminate MAE).

As soon as MAE is no longer the active window, the original modifier map is restored and all keystrokes function as defined for the X environment. This restoration, however, is not reliable under all circumstances. For example, pushing an MAE session over the network to a server running X11R6 can result in unpredictable results.

One solution to this problem is to disable MAE's ability to change the modifier keys. This can be done either by setting an environment variable

```
set TBNOMODMAP=1
```

or by starting MAE with the -nomodmap option.

IMPORTANT: Be careful if you choose to disable the modifier mapping; keystrokes intended for MAE may be trapped by the X Window Manager with unexpected results.

Full-screen MAE displays

To arrange for full-screen MAE display without a window manager running, use the -geometry command line option specifying the screen size. Under a window manager, this may not produce the desired effect because of borders, titlebars, etc. For this case, it is best to not specify a geometry and let the window manager do its stuff by using the Maximize button or window menu option. To get the full Macintosh experience under HP VUE, set the X resource Viewwm*mae*clientDecoration to none and start MAE with the geometry set to the full screen size.

Question: If I have a small MAE window and I press the mwm Maximize/Restore button twice, why doesn't it restore the size?

Answer: Due to optimizations, MAE resizes only to widths of 32-pixel multiples. The maximized size is probably not the correct size, so MAE downsizes slightly. When the Maximize/Restore button is next pressed, the window manager correctly notes that the window is not full size, and Maximizes it. To get a smaller size, resize manually.

Question: If I resize my MAE window a little wider, why is there a gray strip on the right side?

Answer: Due to optimizations, MAE only resizes to widths of 32-pixel multiples. If the window is resized less than 32-pixels, MAE doesn't recognize the size change, doesn't inform the window manager, and doesn't change its internal size.

Any resize beyond this point will correct the appearance. This will be corrected in a later version.

Improper toolbar selections while launching from an off-line disk hang MAE

When you launch from an off-line volume -- for example, when you double-click on an icon from a floppy that has been ejected, an insert-media dialog is displayed. If you inadvertently select the wrong button on the MAE Toolbar, (that is, if you click Super Select, X import, or X export instead of the Mount Floppy/CD button), MAE hangs and must be killed. This bug in MAE 2.0 is under investigation.

Other
=====

(HP only) MAE and asecure

In order to use sound with MAE under HP-UX, HP's audio server (Aserver) must be authorized for each user. This is usually performed with the HP utility 'asecure'. If a user is not properly authorized to use the audio server, MAE will issue an error message at startup. Although sound will not be possible, MAE will otherwise continue to function normally. Under some circumstances, it may be desired that MAE bypass its normal check for the presence of Aserver. To do this, set the environment variable 'TB_SOUND_OVERRIDE_CHECK=1' to allow sound to be produced. Although the error messages will still be produced at startup, MAE will ignore them and produce sound. Note that this will not override the security features of the server, but will override MAE's check to see if the asecure feature is installed. For more information on Aserver and asecure, reference your HP documentation.

Usage of 'TZ' Environment Variable

Several routines within MAE use the value specified by the environment variable 'TZ', which declares the time zone for a particular workstation. Failure to define and assign a value to this variable prior to executing MAE may result in an error.

As an example for ksh, you can set this variable with the command

```
export TZ=PST8PDT
```

if you are located in the Pacific time zone. For more information, reference the appropriate man pages for your OS.

MAE and Globetrotter's FLEXwrap Utility

If you wish to use MAE with the FLEXwrap utility from Globetrotter, you must use a feature of FLEXwrap that is not enabled by default. Failure to enable this feature will result in the inability to execute a Macintosh 'Restart' from the Finder.

To enable the feature, perform the following steps:

- 1) In the apple/bin directory, rename `mae' to `mae.orig'.
- 2) Create a symlink named `mae' to FLEXwrap's fwrapper program in the apple/bin directory.
- 3) When the installer for FLEXwrap is run, there is an option to specify a value for `argv[0]'. Give it the full path name to `mae.orig' (as created in Step 1, above).
- 4) If you had previously run the FLEXwrap installer, you can edit the license manager file (default `license.dat') and replace the `w_binary=' entry with `w_argv=' and point it to the full path of `mae.orig'.

Example: MAE is installed into /opt/apple and FLEXwrap is installed into /opt/flex/flexwrap. apple/bin/mae is renamed to apple/bin/mae.orig and a symbolic link named mae is created that points to the location of the fwrapper program, which is /opt/flex/flexwrap/sun4_u5/fwrapper. Since an entry for MAE already exists in the license.dat file for FLEXwrap, the entry specifying f_binary=/opt/apple/bin/mae is replaced with f_argv=/opt/apple/bin/mae.orig. For more information on FLEXwrap, refer to that product's documentation or contact Globetrotter for assistance.

MAE users wishing to utilize FLEXwrap must contact their Apple sales representative for licensing issues prior to implementing FLEXwrap.

(HP only) HP-UX 9.0.1 and STREAMS/UX

On HP-UX, MAE requires that STREAMS/UX be installed if you are planning to run AppleTalk. The v2.0 CD contains packages for both 9.0.3 and 9.0.5 of HP-UX. If you are running 9.0.1, you can use the STREAMS/UX package for 9.0.3. Please note that MAE does not support sound if used with 9.0.1.

Applications and Processor Performance

MacOS applications, whether they are running on MAE or on a Macintosh, normally dispatch each `event' as it occurs from a main program loop. Examples of events are mouse movement, screen update, etc. To await the next event, Macintosh programs normally use WaitNextEvent, which waits for an event or the expiration of a timeout while yielding processing time to other Macintosh programs. While WaitNextEvent is waiting and provided no events need attention, MAE will sleep, imposing a negligible load on the processor.

Some applications (SimpleText is among the popular examples) increase responsiveness, at the cost of higher processor load, by using very short timeouts while waiting for events. Running under MAE, such programs use the processor heavily. Programs with longer timeout values, such as MacWrite II, operate nicely in the MAE environment.

MAE and Meeting Maker XP

If you install Meeting Maker XP for use with MAE, you should remove the extension titled `Meeting Maker XP Extension' from the Extensions folder. It is not compatible with MAE and will be disabled when MAE is started. The extension is used to alert a user of a message when Meeting Maker XP is not active. To

receive such messages, leave Meeting Maker XP running.

Using FETCH (an FTP Utility)

Using Fetch to "get" and "put" non-text Macintosh files from or to UNIX filesystems requires special care to insure the files are transferred in a usable state by MAE (that is preserving their AppleSingle format).

When doing a GET of a non-text Macintosh file, always select "binary" transfer mode. When doing a PUT of a non-text Macintosh file, always select "AppleSingle" as the file format when prompted by the dialog. Macintosh and UNIX text files should always be transferred by selecting "text" (ASCII) transfer mode.

For complete instructions about using Fetch, read the online "Fetch Help".

If you use Fetch, please honor its license by paying the shareware fee.

Using SOFTWAREFPU (Floating Point Unit Extension)

This extension simulates the FPU co-processor chip found in some Macintoshes and integrated into certain 68K CPU's. It is only useful for (the very few) Macintosh applications that require this FPU.

Complete instructions about using SoftwareFPU are included with the utility.

If you use SoftwareFPU, please honor its license by paying the shareware fee.

Using DISINFECTANT (Virus Utility)

MAE is susceptible to the same viruses that plague the Macintosh. However, there is no need to scan your entire UNIX filesystem for Macintosh viruses. When scanning with Disinfectant, hold down the Option key and press the "Scan" button, this will display a dialog that will allow you to limit the scope of the search.

For complete instructions about using Disinfectant, please read the online "Disinfectant Help".

Security: Everyone

Color LW 12/600 PS: Transparencies From UNIX Workstation (1/96)

Article Created: 18 January 1996
Article Reviewed/Updated: 29 January 1996

TOPIC -----

I have a Color LaserWriter 12/600 PS printer and only UNIX workstations on a TCP/IP LAN. How do I "tell" the printer to use transparent (OH-film) paper? Is this possible through PostScript code or a utility?

DISCUSSION -----

The Color LaserWriter 12/600 PS automatically detects when you are printing on transparencies from the multipurpose tray, so you merely need to send a job to and print from that paper source.

If your client does not allow convenient selection of that paper source, place your transparencies in the multipurpose tray, pull out the built-in paper cassette a few inches (you do not have to remove it), and the printer will default to printing on "paper" in the multipurpose tray.

You do not need to send the Color LaserWriter 12/600 PS PostScript code to tell it you are printing to transparencies because it uses a photosensor to detect the presence of the special transparencies. The printer does this by looking for a reflection from the white rectangle at the leading edge of the transparency. When the white rectangle is detected the printer enters into transparency mode.

When the Color LaserWriter 12/600 PS is in the transparency mode an extra transfer drum rotation is added to the end of the printing process during which the transfer drum and fuser rotational speed is cut in half to improve the toner fusing characteristics.

Using Transparencies

When using transparencies, make sure you:

- Use only transparencies designed for use with the Color LaserWriter

12/600 PS (Apple part number M3876G/A).

- Insert Color LaserWriter transparencies as shown in the manual, other orientations may cause jams.
- Print only from the multipurpose tray.

PostScript Code

To select the multipurpose tray with PostScript, include one of the following code segments with the print job.

CAUTION: If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

1) setpapertray is a PostScript Level 1 command that can be used on any PostScript printer:

Begin_Table

Apple Keyboard Home Keys: Position of Bumps (1/96)

Revised: 1/18/96
Security: Everyone

Apple Keyboard Home Keys: Position of "Bumps" (1/96)

=====

Article Created: 18 January 1996

TOPIC -----

Why do the keyboards for Macintosh computers in the United Kingdom (UK) put the home key "bumps" on the D and K keys? Touch typists in the UK are taught to use the F and J keys as the home keys.

A blind user gets a bit confused when he tries to find the home keys, he can tell that they aren't on the F and J keys because his hands are too far apart.

DISCUSSION -----

The keyboards in the U.S. also have these "bumps" on the D and K keys. We have checked with engineering for information on why the D and K keys are used while other companies use the F and J keys. There is no standard, such as ISO or ANSI, that specifies which keys should have these "bumps," or that they should have the "bumps" at all.

At some time in Apple's history it was decided to put the "bumps" on the D and K keys and it has stayed that way ever since. We checked a number of different Apple keyboards and they all had the "bumps" on the D and K, even our Apple IIe. Apple is not going to change the location of the "bumps" on future revisions of the keyboard as the location of the "bumps" on the Apple keyboard has become Apple's standard.

We do not receive many questions about this, but I understand how it could be a source of frustration for a user that is blind and accustomed to the "bumps" being on the F and J keys on other types of keyboards. A possible solution for this user would be to swap positions of the keys. The keycaps on the keys can be carefully pried up and off of the keyswitch and then swapped over to the other keyswitches.

Newton 2.0 OS: Error -48200 Trying to Print (1/96)

Revised: 1/22/96
Security: Everyone

Newton 2.0 OS: Error -48200 Trying to Print (1/96)

=====

Article Created: 22 January 1996

TOPIC -----

With my Apple MessagePad 120 using the Newton 2.0 OS, if I do a "selected" find, specifying the Dates application and a date range, and then try to print any of the items I get a -48200 error. What am I doing wrong?

DISCUSSION -----

This is a problem with the Dates application and affects both trying to print or fax the found items. However mailing or beaming the found items works correctly.

Workaround
=====

Step 1

Open the Dates application

Step 2

Use find to locate the information you are looking for.

Step 3

Print the information.

This will be fixed in a future System Update.

MAE: Installing MAE Patch 2 on Solaris (1/96)

Revised: 1/22/96
Security: Everyone

MAE: Installing MAE Patch 2 on Solaris (1/96)

Article Created: 22 January 1996

TOPIC -----

This article describes how to install Patch 2 for MAE on a SPARCStation running Solaris 2.3, 2.4 and 2.5.

DISCUSSION -----

Download the appropriate file for your workstation.

NOTE: The tar files are compressed internally and did not require further compression using `compress' or a similar utility.

Extracting the Patch Files From the Downloaded File

Place the tar file anywhere. Extract it by running the following command:

```
% tar xovf maepatch2.0.2.sun.tar
```

The extracted files will be placed in a new directory named "maepatch2.0.2.sun". Once the extraction is complete, you can delete the downloaded file maepatch2.0.2.*.tar.

Preparing For Patch Installation

Before you run the patch installer, make backup copies of two directories: your system folder (normally in your home directory, in the directory "System Folder"), and the directory ".mac" within your home directory. In the event that patch installation results in an inoperable copy of MAE, you will be able to reconstruct your original MAE environment, from these saved copies, by removing the damaged apple directory, reinstalling MAE 2.0, and restoring your saved copies of the System Folder and .mac.

Important Information For AppleTalk Users

..TIL19236-MAE-Installing_MAE_Patch_2_on_Solaris_1-96_(TA34991).pdf

If you have more than one copy of MAE on any workstation, you must update all copies of MAE with this patch at the same time. The AppleTalk driver in MAE 2.0.2 is not compatible with older versions of MAE (2.0 or 2.0.1). This applies to multiple copies of MAE on the same workstation only.

If you are executing MAE v2.0 (or v2.0.1) on Solaris v2.3 and are using AppleTalk, you must install Solaris jumbo patch #101306-10 or its equivalent before you install MAE v2.0.2. Please contact your local Sun support channel for more information.

Important: Run Under the Appropriate Login Account

The account used to install the patch must have read/write privileges to all files in your apple directory; you can best accomplish this by running the patch installer under the same account originally used to install MAE 2.0. This patch includes new version of AppleTalk kernel modules as well as new version of various files from your apple directory. In order to install the patched version of the AppleTalk kernel modules, you must run the patch installer as root (superuser).

Applying the Patch

After you are appropriately logged in, cd into the newly created "maepatch2.0.2.sun" directory. Apply the patch by running the "PATCH.SH" program as follows:

```
% cd maepatch2.0.2.sun
% ./PATCH.SH
```

PATCH.SH will lead you through the installation process. You will have a choice of 'Easy' or 'Custom' installation as well as 'Remove'. Easy installation patches both your Apple directory and the AppleTalk kernel modules; Custom installation gives you the opportunity to patch only one or the other. If your copy of MAE is on a central server, serving many workstations, you will have to patch JUST the copy of MAE on the server, and JUST the AppleTalk kernel modules, on the workstations.

Remove will delete the MAE components from your system (but not any System Folders located in a \$HOME directory). See the FAQ for more information on removal of MAE.

Reinstalling Custom Resources

The patch will replace several files in your System Folder. If you have installed any custom sounds or applications that have modified resources within the file 'System' in the System Folder, you will be able to use your backed-up copy of System to help you reinstall the custom resources, after patch installation is complete. If you are not sure if any application has done this, refer to that application's documentation.

MAE: Where to Find MAE Patch 2 (1/96)

Revised: 1/22/96
Security: Everyone

MAE: Where to Find MAE Patch 2 (1/96)

Article Created: 22 January 1996

TOPIC -----

This article describes how to obtain MAE Patch 2 to upgrade MAE from 2.0.x to 2.0.2.

DISCUSSION -----

How to Download MAE 2.0.2

There are two sites to locate the latest patch. Connect to one of the following locations to get the appropriate tar file (sun, hp, or hp10):

- ftp.support.apple.com (130.43.6.3)
- www.mae.apple.com (17.255.216.51)

These patches can be obtained from the following directory on the server:

/pub/mae/patches/mae_patch_2.0.2

IMPORTANT: Make sure you use FTP "binary transfer" mode to get the following files.

/pub/mae/patches/mae_patch_2.0.2/README.PATCH.MAE2.0.2 - This file contains complete details on what is contained in the patch release as well as how to download and install the patches.

/pub/mae/patches/mae_patch_2.0.2/maepatch2.0.2.hp.tar - The most recent incremental update for MAE 2.0 running HP-UX 9.x on HP Series 700 workstations.

/pub/mae/patches/mae_patch_2.0.2/maepatch2.0.2.hp10.tar - The most recent incremental update for MAE 2.0 running HP-UX 10.01 on HP Series 700 workstations.

..TIL19237-MAE-Where_to_Find_MAE_Patch_2_1-96_(TA34992).pdf

/pub/mae/patches/mae_patch_2.0.2/maepatch2.0.2.sun.tar - The most recent incremental update for MAE 2.0 running on Sun SPARC workstations.

Download the appropriate file for your workstation. Please note, the tar files are compressed internally and did not require further compression using 'compress' or a similar utility.

Extracting the Patch Files From the Downloaded File

Place the tar file anywhere. Extract it by running the following command:

On HP-UX 9.x Workstations:

```
% tar xovf maepatch2.0.2.hp.tar
```

On HP-UX 10.01 Workstations:

```
% tar xovf maepatch2.0.2.hp10.tar
```

On Sun Workstations:

```
% tar xovf maepatch2.0.2.sun.tar
```

The extracted files will be placed in a new directory named "maepatch2.0.2.sun", "maepatch2.0.2.hp", or "maepatch2.0.2.hp10" depending on your system type. Once the extraction is complete, you can delete the downloaded file maepatch2.0.2.*.tar.

MAE 2.0: Installing MAE Patch 2 on HP-UX 9.0.x & 10.01 (5/96)

Revised: 5/13/96
Security: Everyone

MAE 2.0: Installing MAE Patch 2 on HP-UX 9.0.x & 10.01 (5/96)

Article Created: 22 January 1996
Article Reviewed/Updated: 13 May 1996

TOPIC -----

This article describes how to install Patch 2 for MAE on a HP (Hewlett Packard) workstation running HP-UX 9.0.x and 10.01.

DISCUSSION -----

Download the appropriate file for your workstation. It is important to download the patch that is associated with the version of hp-ux ('maepatch2.0.2.hp.tar' for hp-ux v9.0.x and 'maepatch2.0.2.hp10.tar' for hp-ux v10.01) Note: the tar files are compressed internally and did not require further compression using 'compress' or a similar utility.

NOTE: As of April 1996, HP-UP 10.1 is not supported with MAE 2.0.2..

Extracting the Patch Files From the Downloaded File

Place the tar file anywhere. Extract it by running the following command:

On HP-UX 9.x Workstations:
% tar xovf maepatch2.0.2.hp.tar

On HP-UX 10.01 Workstations:
% tar xovf maepatch2.0.2.hp10.tar

The extracted files will be placed in a new directory named "maepatch2.0.2.hp" or "maepatch2.0.2.hp10" depending on your system type. Once the extraction is complete, you can delete the downloaded file maepatch2.0.2.*.tar.

Preparing For Patch Installation

Before you run the patch installer, make backup copies of two directories: your system folder (normally in your home directory, in the directory "System

Folder"), and the directory ".mac" within your home directory. In the event that patch installation results in an inoperable copy of MAE, you will be able to reconstruct your original MAE environment, from these saved copies, by removing the damaged apple directory, reinstalling MAE 2.0, and restoring your saved copies of the System Folder and .mac.

Important Information For AppleTalk Users

If you have more than one copy of MAE on any workstation, you must update all copies of MAE with this patch at the same time. The AppleTalk driver in MAE 2.0.2 is not compatible with older versions of MAE (2.0 or 2.0.1). This applies to multiple copies of MAE on the same workstation only.

Important Information For HP-UX Version 10.01 Users

The MAE binaries for HP-UX v9.x and v10.01 are not interchangeable. If you are installing this patch to allow MAE to run on an HP-UX 10.01 system, you should be aware that the updated binaries will no longer function on a 9.x system. If you have multiple workstations sharing the same binary directory (appldir), you may wish to reinstall MAE from the CD-ROM onto a 9.x system. The patch can then be safely applied to both systems, creating updated executables for each environment.

Below are instructions for installing MAE 2.0.2 for use with HP-UX 10.01:

- For a new installation of MAE for HP-UX 10.01, first install MAE v2.0 as distributed on the CD-ROM but do not install AppleTalk (you can do this by performing a custom installation (as detailed in the 'MAE User's Guide')). After you have installed MAE 2.0 from the CD-ROM, you can apply the MAE 2.0.2 patch by executing ./PATCH.SH as distributed with the patch. Note that the STREAMS package is not required for HP-UX 10.01.
- HP-UX 10.01 was not supported in versions 2.0 and 2.0.1. As a result, upgrade instructions are not included here.
- If you are upgrading from MAE v1.0, first rename any existing MAE v1.0 (or MAE v1.0a) System Folders. Next, install MAE v2.0 as distributed on the CD-ROM but do not install AppleTalk (you can do this by performing a custom installation as detailed in the 'MAE User's Guide'). This will create a new System Folder to which you can manually drag/copy any resources (Extensions, Fonts, Preferences, etc.) from your old MAE v1.0 System Folder. You can now safely apply the MAE 2.0.2 patch by executing ./PATCH.SH as distributed with the patch.
- To remove MAE except for the AppleTalk components, use the Remove feature of the installer supplied with the MAE v2.0 CD-ROM and/or the 2.0.2 patch distribution. Note that the 2.0.1 patch does not have any removal capabilities and that the 2.0.2 patch will ONLY remove previously-installed 2.0.2 components. Then remove the AppleTalk components utilizing the Remove feature of MAE 2.0.2.

The device files for HP-UX 10.01 have also changed. As a result, the

`macdisks.HPUX' file will require modifications to function with your existing devices. This is true even if you had previously made these changes for an HP-UX 9.x system. Note that using the `default' convention will not work for HP-UX 10.01; you need to explicitly specify the path to the device. Examples are provided in the updated file installed by the patch (when installing for HP-UX 10.01).

Important: Run Under the Appropriate Login Account

The account used to install the patch must have read/write privileges to all files in your apple directory; you can best accomplish this by running the patch installer under the same account originally used to install MAE 2.0. This patch includes new version of AppleTalk kernel modules as well as new version of various files from your apple directory. In order to install the patched version of the AppleTalk kernel modules, you must run the patch installer as root (superuser).

Applying the Patch

After you are appropriately logged in, cd into the newly created "maepatch2.0.2.hp" or "maepatch2.0.2.hp10" directory. Apply the patch by running the "PATCH.SH" program as follows:

On HP-UX 9.x Workstations:

```
% cd maepatch2.0.2.hp
% ./PATCH.SH
```

On HP-UX 10.01 Workstations:

```
% cd maepatch2.0.2.hp10
% ./PATCH.SH
```

PATCH.SH will lead you through the installation process. You will have a choice of `Easy' or `Custom' installation as well as `Remove'. Easy installation patches both your Apple directory and the AppleTalk kernel modules; Custom installation gives you the opportunity to patch only one or the other. If your copy of MAE is on a central server, serving many workstations, you will have to patch JUST the copy of MAE on the server, and JUST the AppleTalk kernel modules, on the workstations.

Remove will delete the MAE components from your system (but not any System Folders located in a \$HOME directory). See the FAQ for more information on removal of MAE.

Reinstalling Custom Resources

The patch will replace several files in your System Folder. If you have installed any custom sounds or applications that have modified resources within the file `System' in the System Folder, you will be able to use your backed-up copy of System to help you reinstall the custom resources, after patch installation is complete. If you are not sure if any application has done this, refer to that application's documentation.

Security: Everyone

MAE 2.0.2: README.PATCH.MAE2.0.2 (1/96)

Article Created: 22 January 1996

TOPIC -----

This is the README.PATCH.MAE2.0.2 for /pub/mae/patches/mae_patch_2.0.2 12/21/95 file.

DISCUSSION -----

License Statement

=====

THIS PATCH IS COVERED BY THE "SOFTWARE LICENSE FOR MACINTOSH APPLICATION ENVIRONMENT PATCH" (see the file /pub/mae/patches/mae_patch_license.txt on the FTP server ftp.support.apple.com). PLEASE READ THE LICENSE CAREFULLY BEFORE DOWNLOADING THIS SOFTWARE. BY DOWNLOADING AND/OR USING THIS SOFTWARE, YOU ARE AGREEING TO BE BOUND BY THE TERMS OF THE LICENSE. IF YOU DO NOT AGREE TO THE TERMS OF THIS LICENSE, YOU ARE NOT AUTHORIZED TO DOWNLOAD THIS SOFTWARE.

Incremental Update For Apple's MAE 2.0 Product

=====

The files in this directory allow you to update your purchased copy of MAE 2.0 (or patched version 2.0.1) to version 2.0.2 for free. By applying the latest patch, you will update your copy of MAE 2.0 with the bug fixes from all prior patches. As the patches are cumulative, there is no need to install any previous patch prior to installing the most current one.

IMPORTANT: MAE must NOT be running while you apply this patch. You will need to have approximately 25MB of available disk space to install the patch. After the patch installation is complete, however, your patched copy of MAE 2.0.2 will require about the same amount of disk space as MAE 2.0 (or 2.0.1). The 25MB requirement permits the patch installer to back up your copy of MAE, for safety, during the patch installation process.

MAE 2.0.2 (Patch Release "2")

(Found in /pub/mae/patches/mae_patch_2.0.2)

Get the file "README.PATCH.MAE2.0.2" for Patch "2" information and installation instructions. This patch (MAE 2.0.2) is the second released patch to MAE 2.0. It introduces the changes listed below. (The number in parenthesis indicates at which patch level the bug was fixed):

Changes in MAE 2.0.2

-
- (2) (HP only) HP-UX Version 10.01 -
HP-UX Version 10.01 can now be used with MAE. IMPORTANT: Be sure to read the file `README.PATCH.MAE2.0.2' on the FTP server prior to installing this patch to support HP-UX Version 10.01.
 - (2) (Sun only) FDDI Support -
FDDI interfaces are now supported.
 - (2) (Sun only) Ethernet Interfaces other than `le'
MAE now supports Ethernet interfaces on Solaris such as qe. Previously, only le devices were supported.
 - (2) Multiple Ethernet Interfaces -
AppleTalk can now be used on any available (and supported) network interface. The Network Control Panel has been updated to add this functionality.
 - (2) Persistent TIVs -
Persistent TIVs are no longer truncated during shutdown.
 - (2) Locking Mechanism for System Folder Updates -
The updater utility for System Folders (part of the patch mechanism) no longer bypasses the file integrity lock if MAE is running. This only occurred under isolated circumstances.
 - (2) (HP only) Automounter Directory
The automounter directory for HP-UX (default /tmp_mnt) is now properly statused.
 - (2) (Sun only) Solaris 2.4 and Automounted Directories
MAE no longer truncates its internal filesystem list when executed in an environment with multiple remotely-mounted volumes. This symptom did not manifest itself under Solaris 2.3.
 - (2) (Sun only) Sun 5 Keyboard -
The 0 (zero) key on Sun's Type 5 keyboard now functions properly.
 - (2) Command line options -
MAE will no longer exhibit random errors at startup based on the number of arguments supplied in the command line.
 - (1) Updated man Page -

The online manual pages now reflect changes and features of MAE 2.0 that were omitted from the man pages supplied with the MAE 2.0 distribution.

- (1) Network Control Panel -
Opening the Network Control Panel will no longer result in an error message.
- (1) (Sun only) Attention Packets -
Urgent ADSP messages are now delivered promptly to the MAE process. Previously, there was a delay in delivering these messages.
- (1) (Sun only) ADSP Close -
Custom applications that send ADSP close packet now work correctly.
- (1) Utilization of Selected AppleTalk Zone -
A previously-selected AppleTalk zone is now being used as the default zone. In addition, a list of eligible devices is presented when selecting a network resource (e.g., printer). This problem only occurred under isolated circumstances.
- (1) File Transfers Under TCP -
Fetch or other applications now pull large (>100K) files utilizing TCP correctly. (Smaller files were not affected.)
- (1) Saving Documents When Using MacinTax -
MacinTax is now able to save documents.
- (1) (HP only) Users' Guide Updated -
The online Users' Guide for MAE now reflects features and changes present in v2.0 which were omitted from the MAE 2.0 distribution.
- (1) Debugging Options -
Additional command line options have been added to assist in debugging MAE 2.0 problems.
- (1) (Sun only) Support for CacheFS -
New functionality was added to support CacheFS, a new filesystem introduced with Solaris 2.4.
- (1) Support For AFS (Andrew File System) -
Additional features have been added to support local cells for AFS.
- (1) Other fixes
Various minor bugs in MAE 2.0 are corrected in MAE 2.0.1

How To Download and Install MAE 2.0.2 =====

On the FTP server ftp.support.apple.com (130.43.6.3), get the appropriate tar file (sun, hp, or hp10) from the directory

/pub/mae/patches/mae_patch_2.0.2

IMPORTANT: Make sure you use FTP "binary transfer" mode to get the files.

/pub/mae/patches/mae_patch_2.0.2/README.PATCH.MAE2.0.2 - This file.

/pub/mae/patches/mae_patch_2.0.2/maepatch2.0.2.hp.tar - The most recent incremental update for MAE 2.0 running HP-UX 9.x on HP Series 700 workstations.

/pub/mae/patches/mae_patch_2.0.2/maepatch2.0.2.hp10.tar - The most recent incremental update for MAE 2.0 running HP-UX 10.01 on HP Series 700 workstations.

/pub/mae/patches/mae_patch_2.0.2/maepatch2.0.2.sun.tar - The most recent incremental update for MAE 2.0 running on Sun SPARC workstations.

Download the appropriate file for your workstation. Note: the tar files are compressed internally and did not require further compression using `compress` or a similar utility.

Extracting the Patch Files From the Downloaded File

=====

Place the tar file anywhere. Extract it by running the following command:

On HP-UX 9.x Workstations:

% tar xovf maepatch2.0.2.hp.tar

On HP-UX 10.01 Workstations:

% tar xovf maepatch2.0.2.hp10.tar

On Sun Workstations:

% tar xovf maepatch2.0.2.sun.tar

The extracted files will be placed in a new directory named "maepatch2.0.2.sun", "maepatch2.0.2.hp", or "maepatch2.0.2.hp10" depending on your system type. Once the extraction is complete, you can delete the downloaded file maepatch2.0.2.*.tar.

Preparing For Patch Installation

=====

Before you run the patch installer, make backup copies of two directories: your system folder (normally in your home directory, in the directory "System Folder"), and the directory ".mac" within your home directory. In the event that patch installation results in an inoperable copy of MAE, you will be able to reconstruct your original MAE environment, from these saved copies, by removing the damaged apple directory, reinstalling MAE 2.0, and restoring your saved copies of the System Folder and .mac.

Important Information For AppleTalk Users

=====

If you have more than one copy of MAE on any workstation, you must update all copies of MAE with this patch at the same time. The AppleTalk driver in MAE 2.0.2 is not compatible with older versions of MAE (2.0 or 2.0.1). This applies to multiple copies of MAE on the same workstation only.

If you are executing MAE v2.0 (or v2.0.1) on Solaris v2.3 and are using AppleTalk, you must install Solaris jumbo patch #101306-10 or its equivalent before you install MAE v2.0.2. Please contact your local Sun support channel for more information.

Important Information For HP-UX Version 10.01 Users

=====

The MAE binaries for HP-UX v9.x and v10.01 are not interchangeable. If you are installing this patch to allow MAE to run on an HP-UX 10.01 system, you should be aware that the updated binaries will no longer function on a 9.x system. If you have multiple workstations sharing the same binary directory (appledir), you may wish to reinstall MAE from the CD-ROM onto a 9.x system. The patch can then be safely applied to both systems, creating updated executables for each environment.

Below are instructions for installing MAE 2.0.2 for use with HP-UX 10.01:

- For a new installation of MAE for HP-UX 10.01, first install MAE v2.0 as distributed on the CD-ROM but do not install AppleTalk (you can do this by performing a custom installation (as detailed in the 'MAE User's Guide')). After you have installed MAE 2.0 from the CD-ROM, you can apply the MAE 2.0.2 patch by executing ./PATCH.SH as distributed with the patch. Note that the STREAMS package is not required for HP-UX 10.01.
- HP-UX 10.01 was not supported in versions 2.0 and 2.0.1. As a result, upgrade instructions are not included here.
- If you are upgrading from MAE v1.0, first rename any existing MAE v1.0 (or MAE v1.0a) System Folders. Next, install MAE v2.0 as distributed on the CD-ROM but do not install AppleTalk (you can do this by performing a custom installation as detailed in the 'MAE User's Guide'). This will create a new System Folder to which you can manually drag/copy any resources (Extensions, Fonts, Preferences, etc.) from your old MAE v1.0 System Folder. You can now safely apply the MAE 2.0.2 patch by executing ./PATCH.SH as distributed with the patch.
- To remove MAE except for the AppleTalk components, use the Remove feature of the installer supplied with the MAE v2.0 CD-ROM and/or the 2.0.2 patch distribution. Note that the 2.0.1 patch does not have any removal capabilities and that the 2.0.2 patch will ONLY remove previously-installed 2.0.2 components. Then remove the AppleTalk

components utilizing the Remove feature of MAE 2.0.2.

The device files for HP-UX 10.01 have also changed. As a result, the 'macdisks.HPUX' file will require modifications to function with your existing devices. This is true even if you had previously made these changes for an HP-UX 9.x system. Note that using the 'default' convention will not work for HP-UX 10.01; you need to explicitly specify the path to the device. Examples are provided in the updated file installed by the patch (when installing for HP-UX 10.01).

Important: Run Under The Appropriate Login Account

=====

The account used to install the patch must have read/write privileges to all files in your apple directory; you can best accomplish this by running the patch installer under the same account originally used to install MAE 2.0. This patch includes new version of AppleTalk kernel modules as well as new version of various files from your apple directory. In order to install the patched version of the AppleTalk kernel modules, you must run the patch installer as root (superuser).

Applying The Patch

=====

After you are appropriately logged in, cd into the newly created "maepatch2.0.2.hp", "maepatch2.0.2.hp", or "maepatch2.0.2.hp10" directory. Apply the patch by running the "PATCH.SH" program as follows:

On HP-UX 9.x Workstations:

```
% cd maepatch2.0.2.hp
% ./PATCH.SH
```

On HP-UX 10.01 Workstations:

```
% cd maepatch2.0.2.hp10
% ./PATCH.SH
```

On Sun Workstations:

```
% cd maepatch2.0.2.sun
% ./PATCH.SH
```

PATCH.SH will lead you through the installation process. You will have a choice of 'Easy' or 'Custom' installation as well as 'Remove'. Easy installation patches both your Apple directory and the AppleTalk kernel modules; Custom installation gives you the opportunity to patch only one or the other. If your copy of MAE is on a central server, serving many workstations, you will have to patch JUST the copy of MAE on the server, and JUST the AppleTalk kernel modules, on the workstations.

Remove will delete the MAE components from your system (but not any System Folders located in a \$HOME directory). See the FAQ for more information on removal of MAE.

Reinstalling Custom Resources

=====

The patch will replace several files in your System Folder. If you have installed any custom sounds or applications that have modified resources within the file 'System' in the System Folder, you will be able to use your backed-up copy of System to help you reinstall the custom resources, after patch installation is complete. If you are not sure if any application has done this, refer to that application's documentation.

Review the FAQ and Tech Notes

=====

Included with the tar distribution are the most recent versions of the MAE Frequently-Asked Questions and Technical Notes files. Review these documents carefully for any important information that may apply to you. In addition, these files are regularly updated by MAE Engineering and made available on ftp.support.apple.com as well as via the Web at <http://www.mae.apple.com/>.

LaserWriters: Use Bindery Emulation Under Netware 4.x (1/96)

Revised: 1/22/96
Security: Everyone

LaserWriters: Use Bindery Emulation Under Netware 4.x (1/96)

=====

Article Created: 22 January 1996

TOPIC -----

We have an Apple LaserWriter 16/600 PS on our Ethernet network and I want to set it up to print under Novell NetWare 4.1. I've set up the printer using the included Windows utilities as a NetWare PSERVER. The instructions in the included manual explain using the NetWare utility PCONSOLE to make the printer available under NetWare. The manual tells me to change PCONSOLE to bindery emulation, but I would like to set it up as an NDS object. Do I have to configure the printer in bindery emulation mode?

DISCUSSION -----

According to Novell, setup requires switching to bindery mode in PCONSOLE. Here's some information from Novell's Network Support Encyclopedia about this:

"Network-direct print devices and their installation programs are designed to look in the NetWare 3.1x bindery for network printing information. In order for these devices to work on your NetWare 4 network, you should use the bindery emulation mode when installing them."

For additional information, please contact Novell, Inc. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

NetWare Client for Mac OS 5.1: ReadMe File (1/96)

Revised: 1/22/96
Security: Everyone

NetWare Client for Mac OS 5.1: ReadMe File (1/96)

=====

Article Created: 22 January 1996

TOPIC -----

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information. This article is the NetWare Client for Mac OS 5.1 Read Me file.

DISCUSSION -----

ReadMe File
NetWare Client for Mac OS 5.1
(C) Copyright 1995 Novell, Inc. All rights reserved worldwide.

Welcome to the new release of NetWare Client for Mac OS 5.1. This ReadMe file contains information about known anomalies and, when available, workarounds for these problems. This readme file contains two sections. The first section covers NetWare Client for Mac OS workstation software, and the second section covers NetWare Client for Mac OS server software (NLMS).

CLIENT WORKSTATION SOFTWARE NOTES -

MacIPX 1.3

PROBLEM #1: MacIPX may display an error message containing the error code -94 when trying to use the Ethernet 802.3 frame type with certain Ethernet adapters.

SOLUTION: Install AppleTalk version 58 or later on your workstation. To obtain AppleTalk version 58 or later, contact the manufacturer of your Ethernet adapter. You can also obtain AppleTalk from Apple's Network Software Installer,

version 1.3 or later.

PROBLEM #2: Some third-party applications use their own IPX protocol stacks, and do not use MacIPX. MacIPX may not function properly in their environments, depending on how MacIPX is configured.

SOLUTION: Contact the application vendor and request a version of the application that works with MacIPX. If none is available, you can configure MacIPX to use a network interface setup that is different than the network interface setup used by the other IPX protocol stack. For example, if the application's IPX protocol stack is using the Ethernet 802.3 frame type, you can configure MacIPX to use a different frame type such as 802.2. If this solution is impractical in your situation, you can configure MacIPX to use the LocalTalk network interface rather than the interface in use by the other IPX stack (such as Ethernet). However, this solution requires you to install and configure a MacIPX gateway somewhere on your network. Instructions for MacIPX gateway installation and configuration are located in the NetWare operating system documentation.

PROBLEM #3: Applications using MacIPX cannot locate any services when MacIPX is configured to use the AppleTalk interface.

SOLUTION: Ensure that MacIPX is using a valid MacIPX Gateway and that the Gateway is running on a NetWare server that will reply to Get Nearest Server requests.

PROBLEM #4: MacIPX may not work with some versions of Apple's Power Macintosh 9500.

SOLUTION: The Operating System and Open Transport software components found on the early releases of the Power Macintosh 9500 are incompatible with MacIPX. In the U.S., you can obtain later revisions of this software by ordering an "update" CD for the Power Macintosh 9500 through 1-800-SOS-APPLE. For customers outside of the U.S., please contact your local Apple sales office.

PROBLEM #5: Applications using MacIPX may experience a loss of connectivity when running on Power Macintosh 7200, 7500, 8500, and 9500s.

SOLUTION: There is no solution at this time. Connectivity can be restored on a temporary basis by restarting the Macintosh. As of this writing, Novell believes the problem may be related to the level of traffic on the network. Novell and Apple are working together to determine if the problem is in Open Transport or in MacIPX.

NetWare Client 2.0

PROBLEM #1: Read/Write performance may be slower than other NetWare Client platforms especially over wide area links. The NetWare Client for Mac OS does not currently support burst mode.

SOLUTION: There is no solution at this time.

..TIL19242-NetWare_Client_for_Mac_OS_5-1-ReadMe_File_1-96_(TA34997).pdf

PROBLEM #2: The Macintosh client does not provide an Abort, Retry, Cancel mechanism. If servers or network links are too slow, connections may be dropped by the client.

SOLUTION: There is no solution at this time.

PROBLEM #3: On 7200/90 systems using Ethernet, mounting volumes may be slower than normal because of problems with large packets. The problem is that larger packets cannot be reliably sent. Performance will be increased if the Maximum Packet Size is adjusted in the Advanced Options dialog box of the NetWare Client Control Panel. Novell and Apple are working together to address the problem and a solution is expected in the near future.

SOLUTION: Our experience suggests that a setting of 1100 bytes will speed mounting.

NetWare Directory Browser 1.0

PROBLEM #1: Several beta sites reported a crash while using Apple Guide with the NetWare Directory Browser. Apple Guide would crash when attempting to display a coach mark around something other than a menu title.

SOLUTION: The cause of this problem has been isolated to Apple Guide version 1.2.5 on PowerPC-based systems. If the Apple Guide version 1.2.5 extension is replaced with an older (1.2) or newer (1.2.7) version, the problem does not occur. Our assumption is that Apple Guide 1.2.5 must have some bad Mixed Mode Manager calls. Older versions weren't native (no Mixed Mode Manager calls at all), and newer versions must have caught and fixed the bug.

NetWare File Access 1.0 (NFA)

PROBLEM #1: File creation times are not preserved when the files are copied to NFA volumes and when operated on by certain applications. This causes problems for applications such as installers that require that file creation times be preserved.

SOLUTION: NFA can set a file or directory's creation time only if the user is supervisor equivalent. This is due to a problem in the NetWare server. To work around the problem, either log on as the server administrator or use AppleShare to mount volumes for which you require that creation dates be preserved (for example, if you are moving an installer and its files to a NetWare server). An update release will contain patches for the problem on existing servers and a new NFA that will take advantage of the fixes.

NetWare Object Assistant 1.0

No known problems.

NetWare Print Access 1.0 (NPA)

PROBLEM #1: Some PostScript downloading or LaserWriter utilities may not recognize or use NetWare Print Queues selected using the NetWare Print Chooser. Normally they should respond with a "Printer not found" message.

SOLUTION: Use a utility that communicates with the printer currently selected in the Chooser, such as Adobe SendPS. Such utilities generally work with NetWare Print Access on the printer or queue most recently selected in the NetWare Print Chooser.

PROBLEM #2: Error code -8993 occurs when printing in the background with NPA using the LaserWriter/PSPrinter 8.x driver.

SOLUTION: This problem is rare, and thought to be a result of the driver timing out due to not getting enough processor time. If you experience this problem, switch to foreground printing, or try to avoid intensive activity on your workstation when background printing is in progress.

PROBLEM #3: When using the NetWare Print Chooser to select LaserWriter/PSPrinter 8.1.2 or higher, the following alert may appear when Setup is started:
"Autosetup failed, reverting to manual setup."

SOLUTION: This alert indicates that the driver is looking for information about the target printer's installable options. NPA does not have this information. Click OK and manually indicate the printer's installed options, to the best of your knowledge.

PROBLEM #4: When using the LaserWriter driver versions 8.0, 8.2, or 8.2.2 to print, the Macintosh workstation sometimes hangs.

SOLUTION: Some versions of Apple's LaserWriter 8 driver have a bug which causes a hang when it tries to download a variation of the Helvetica font. To verify that this is the problem, turn background printing off in NetWare Print Chooser and print. Watch to see if the Macintosh hangs while displaying the message "Creating Screen Font: Helvetica" or "Downloading Helvetica-Oblique."

To work around this issue:

1) choose another print driver. LaserWriter versions 7.x, 8.1.1, and 8.3 do not suffer from this problem.

OR

2) after selecting the driver in the NetWare Print Chooser, use the "Setup" button to select a PPD file for the printer. This allows NPA to tell the driver that Helvetica is already present on the printer so that it isn't downloaded.

OR

3) after selecting the object in the NetWare Print Chooser, check the "Assume Standard Fonts" box under the "NetWare Options..." button. This allows NPA to tell the driver that Helvetica is already present on the printer so that it isn't downloaded.

PROBLEM #5: When printing in the background, the following message may appear:

There is not enough memory to print "<document>" from "<application>" on printer "<printer>." Do you want PrintMonitor to adjust its memory size and try again?

SOLUTION: Some versions of Apple's PrintMonitor allocate by default too little memory to accommodate NetWare Print Access. To correct this problem, you can click the "Adjust Memory Size" button in the above alert; you may be required to select this option two or more times successively before you can successfully print.

Alternatively, you can select the "Cancel Printing" option and manually adjust PrintMonitor's memory size. Click on the PrintMonitor application in the System:Extensions folder and select "Get Info" from the file menu. In the "Memory Requirements" area, set "Preferred size:" to at least 120K. Then try printing again.

PROBLEM #6: Two short (less than 60 character) print job notification messages appear in rapid succession referring to one job.

This may happen when print notification is turned on and printing to a queue (or referenced printer object) without being logged into the server where the queue physically resides.

SOLUTION:

- 1) Turn off notification
- 2) Log into the matching server

PROBLEM #7: Jobs from QuarkExpress, Adobe Photoshop, or other applications which have the option of sending the data in binary format will not print successfully with a PostScript error or images may print with artifacts or noise.

SOLUTION:

- 1) Many Macintosh applications that output graphics have the option in the application's Page Setup or Print dialog window to send the data in either Binary or ASCII format. Choose ASCII format.
- 2) If your printer supports it, have the network administrator set up the Printer object to support binary communications over a non-binary communications channel. Netware Print Access will then encode the binary data properly.

NetWare Print Chooser 1.0

PROBLEM #1: If you run NetWare Print Chooser concurrently with Apple's Chooser, the two applications may compete for ownership of the print drivers and thereby lead to serious problems, including crashes.

SOLUTION: Run only one chooser at a time.

PROBLEM #2: In the case where a NetWare Directory Services print queue object has multiple AppleTalk network address attributes with different NBP types--for example, the spooler is advertised by more than one ATPS spooler--NetWare Print Chooser may not enable all of the appropriate AppleTalk print drivers in the driver list.

SOLUTION: Such Directory Services objects may be rare at your site, in which case you would seldom encounter this problem. If the situation does arise, you will simply be limited in your choice of print drivers.

PROBLEM #3: When you first add a print driver extension to your Extension folder, the icon for that driver may not show correctly in NetWare Print Chooser.

SOLUTION: NetWare Print Chooser gets its icons from the desktop database. Eventually the desktop will get updated and the correct icons will display. If you wish to accelerate this process, try opening the Extensions folder on your desktop, forcing Finder to acknowledge that icon. The next time you run NetWare Print Chooser, it will show the correct icon.

PROBLEM #4: If you log out of the tree while NetWare Print Chooser is still running and then proceed to switch drivers and/or setup driver options, you may experience problems or even crash.

SOLUTION: The best thing to do is to quit the application before logging out of the tree.

PROBLEM #7: With GX installed, NetWare Print Chooser does not allow you to select a print driver.

SOLUTION: This version of NetWare Print Chooser does not support GX. You must remove GX from your system if you wish to use NetWare print services.

NetWare UAM 5.00

No known problems.

NetWare Volume Mounter 1.0

PROBLEM #1: Workstations using System 7.1 may find that the NetWare Volume Mounter does not stagger the windows, but stacks new windows directly on top of old ones.

SOLUTION: There is no solution at this time. To work around this problem move the windows off of each other manually.

Remote Console 1.0

No known problems.

~NetWare Aliases 1.1

PROBLEM #1: Aliases made to a file or folder on a network volume mounted with NetWare Volume Mounter will not resolve correctly in System 7.1.1 if the volume is already mounted via AppleShare. Aliases to a volume will resolve correctly in all cases.

SOLUTION: Upgrade to System 7.5.

SERVER SOFTWARE NOTES -

PINSTALL.NLM and NWCMAcc.NLM 1.0

PROBLEM #1: There are several ways to change the volume name displayed on the workstation when mounting a server volume. One way is through the set commands in MACFILE.NLM. (Type "MACFILE HELP" in the NetWare server's system console when MACFILE.NLM is loaded for more information.) Another way is through AFPCON.NLM when using NetWare for Macintosh. Volume name changes will not take affect dynamically. The indiscriminate changing of Macintosh volume names with these utilities and with AFPCON can result in unexpected volume names. (Last saved wins).

SOLUTION: There is no solution at this time. To work around this issue, remount the volume on the workstation to see the new volume name.

PROBLEM #2: NWCMAcc.NLM can incorrectly identify message and client files that do not belong to the product. This is due to the simplistic key off of the LANGUAGE.4 file name. For example NWCMAcc will locate the NetWare for Macintosh installation directory as a source.

SOLUTION: There is no solution at this time.

MACFILE.NLM 1.0

PROBLEM #1: When MACFILE.NLM is loaded for the first time, or a volume is mounted for the first time after MACFILE.NLM has been loaded, or the desktop database for a volume is being rebuilt, the server may abend with the message, "Subdirectory was deleted during FindDirectoryEntry."

SOLUTION: Try turning file compression off when MACFILE.NLM is loading for the first time, when a volume is mounting for the first time after MACFILE.NLM has been loaded, or when MACFILE.NLM is performing a periodic rebuild. Periodic rebuilds occur every 24 hours by default if AFP.NLM is also loaded.

PROBLEM #2: If a volume is dismounted while MACFILE.NLM is rebuilding a desktop database, error messages indicating that MACFILE.NLM cannot find files on the volume will be displayed.

SOLUTION: Wait to dismount a volume until rebuilding is complete.

PROBLEM #3: Only a few items at a time are removed at MACFILE.NLM load time from a trash can abandoned by a crashed Macintosh.

SOLUTION: Unload and reload MACFILE.NLM again with the empty option. For example: LOAD MACFILE EMPTY

CDROM Support

PROBLEM #1: When using NFA to mount NetWare volumes, you can not choose to mount an HFS formatted CD that is mounted on the server via the HFSCD.NLM.

SOLUTION: There is no solution at this time. To work around this problem, you can find the migrated directory/file structure of the CD by mounting the NetWare volume the CD was migrated to (usually SYS). The folder will have the name of the CD that was mounted through HFSCD.NLM. Some problems with using this workaround include not being able to launch certain applications on CDs that require a hard coded directory path, where the CD name is at the top of this path.

PROBLEM #2: CDROM.NLM will only work with ISO 9660 CDs.

SOLUTION: There is no solution at this time. CDs mounted with the CDROM.NLM will work normally when mounted through NFA, but you can not use CDROM.NLM to mount HFS formatted CDs.

Macintosh Performa 6290CD: Description (4/97)

Revised: 5/1/97
Security: Everyone

Macintosh Performa 6290CD: Description (4/97)

Article Created: 23 January 1996
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article provides a description of the Macintosh Performa 6290CD.

Note: The Macintosh Performa 6290 is similar to the Macintosh Performa 6300CD, but it differs in both the memory configuration and the software bundle.

DISCUSSION -----

The most powerful and versatile Macintosh Performa system ever created brings you increased system speed and enhanced communications performance.

The Apple Macintosh Performa 6290CD computer uses a state-of-the-art PowerPC 603e processor running at 100 megahertz to deliver up to 50 percent higher performance than previous 603-based systems.

The Performa 6290CD will meet your needs well into the future, not only with its leading-edge performance, but also with a 1.2-gigabyte hard drive--large enough to store applications and information for years to come.

This affordable system includes multimedia features that are expensive add-ons with other computers. A quadruple-speed CD-ROM drive accesses CD-based data quickly and plays audio and video segments smoothly. Stereo 16-bit sound provides high-quality audio playback, while an audio-input port lets you record your own sounds. Adding advanced multimedia options is easy. You can plug in a video-input card, a video-output interface box, an internal TV tuner, and other optional devices.

The Performa 6290CD also comes with special features for telephony. The high-speed (28.8 kilobits per second) modem works with the Apple PlainTalk microphone (included with the computer) and special software to let you use the computer as a speak-erphone and an answering machine.

..TIL19244-Macintosh_Performa_6290CD-Description_4-97.pdf

The 6290CD is a complete, ready-to-use multimedia system. Packed in one box are the computer (with Apple System 7.5 software already loaded), a color display, a keyboard, a mouse, an internal modem, and a microphone. Also included are more than a dozen home, education, and home-business programs, plus a collection of multimedia reference CDs.

Features

=====

Power and Speed

- PowerPC 603e processor running at 100 MHz
- Integrated floating-point unit
- 40 MHz, 64-bit bus
- 256K Level 2 cache
- 32K internal cache

Display

- 14" flat square shadow mask CRT
- .28 mm dot pitch
- Resolutions from 640x480 to 832x624

Video support

- Apple displays up to 15 inches through a 1 MB DRAM video buffer (independent of system RAM)
- Wide range of VGA and SVGA displays from other vendors
- Offers 16-bit color for display of up to 32,768 colors on monitors using 640x480-pixel resolution
- Provides 8-bit color for display of 256 colors on monitors using 800x600-pixel or 832x624-pixel resolution

Memory

- Comes with 8 MB of RAM
- Can be expandable to 64 MB of RAM using two 32 MB SIMMs
- Uses 72-pin, noncomposite, 80-nanosecond or faster DRAM SIMMs

Expansion

- Apple Desktop Bus port for mouse, keyboard, and other devices
- Monitor port (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- Serial port (RS-232/RS-422) for an AppleTalk network connection, other networking or communications equipment, or a printer
- SCSI interface port for connecting as many as five external SCSI devices, such as disk drives or CD-ROM drives
- LC processor-direct expansion slot
 - Compatible with most Macintosh Performa 400 and 500 series; Performa 630; Macintosh Quadra 605; and Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630 processor-direct cards

- Can be used for an Apple MPEG Media System card or other specialized card
- Communications slot for a 28.8-kbps fax/data/voice modem (used by Global Village modem)
- Video slot for optional Apple Video System (NTSC, PAL, and SECAM video input)
- Dedicated connector and infrared remote receiver for optional internal Apple TV/Video System (provides TV tuner and video input)

Audio System

- Stereo 16-bit sound
- Built-in speaker
- Sound-output port
- Sound-input port (can be used to connect the Apple PlainTalk microphone included with the computer)
- Front headphone jack and volume control

Bundled software

=====

System Software

- Mac OS 7.5.1 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, and Macintosh PC Exchange software

Pre-installed software

- Acrobat Reader
- The American Heritage Dictionary
- At Ease
- ClarisWorks
- ClickArt Performa Collection
- Connectix Desktop Utilities
- Eric's Solitaire Sample
- Espresso
- Global Fax
- Global Fax Tour
- Lode Runner
- MacGallery Clip Art Treasure Pak
- MacLinkPlus/Easy Open Translators
- Megaphone
- Megaphone Tour
- Quicken
- WealthBuilder
- The Writing Center
- Zoop

CD-ROM titles

- Grolier Multimedia Encyclopedia

- TIME Almanac Reference Edition
- 3D Atlas
- The Family Doctor
- Smithsonian's America
- Jump Start 1st Grade
- Making Music by Voyager
- My First Incredible, Amazing Dictionary

Configuration and Ordering Information

=====

Macintosh Performa 6290CD 8/1.2GB/4xCD/28.8

-
- Macintosh Performa 6290CD computer with 8 MB of RAM, 1 MB of video memory, built-in AppleCD 600i internal quadruple speed CD-ROM player, 1.4 MB Apple SuperDrive floppy disk drive, internal 1.2 GB hard disk drive
 - Global Village 28.8 Internal modem
 - Apple Multiple Scan 14" Display
 - AppleDesign Keyboard
 - Apple PlainTalk microphone
 - Order number M4727LL/A

Optional Enhancements

- Apple MPEG Media System
- Order No. M4243LL/A

- Apple Video System
- Order No. M2894LL/C

- Apple TV/Video System
- Order No. M2896LL/C

- Apple Presentation System
- Order No. M2895LL/A

- Apple Ethernet LC Thin Coax Connection
- Order No. M33462Z/A

- Apple Ethernet LC Twisted-Pair Card (for use with a 10 Base-T compatible hub)
- Order No. M2460Z/A

- Apple Ethernet LC Card (transceiver required)
- Order No. M0443LL/C

NOTE:

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Article Change History:

..TIL19244-Macintosh_Performa_6290CD-Description_4-97.pdf

28 Apr 1997 - Removed out dated on line references.

29 Oct 1996 - Added Ethernet LC Card and Twisted-Pair Order info.

05 Aug 1996 - Corrected modem information.

Performa 640/ LC 630 DOS Compatible: Error 003 and 005 (2/97)

Revised: 2/3/97
Security: Everyone

Performa 640/ LC 630 DOS Compatible: Error 003 and 005 (2/97)

Article Created: 23 January 1996
Article Reviewed/Updated: 3 February 1997

TOPIC -----

When attempting to use the program, PRO_ORG.EXE (which is installed during the Sound Blaster installation) on a Macintosh Performa 640 DOS Compatible computer, you may get an error stating, "Error 003: Hardware Testing Fails." The Macintosh LC 630 DOS Compatible displays a similar error, "Error 005: Hardware Testing Fails" when using this program as well.

DISCUSSION -----

The Macintosh Performa 640 and LC 630 DOS Compatible computers use the Cyrix 486 DX2 Processor in the DOS Environment. With this processor, the computer has a Write Back feature enabled in the AUTOEXEC.BAT with the line:

C:\APPLE\WB.EXE

This allows the processor to write to the hard drive in the background while the user is performing other tasks.

However, the PRO_ORG.EXE program appears not to be compatible with the Write Back feature, which causes these errors. You should contact the developer of Sound Blaster, Creative Labs, for additional information.

In the interim, the workaround is to disable the Write Back feature, which may decrease performance.

To disable the Write Back feature, follow these steps:

Step 1

Edit the AUTOEXEC.BAT file

EDIT AUTOEXEC.BAT

Step 2

REM the line:

C:\APPLE\WB.EXE

To look like this:

REM C:\APPLE\WB.EXE

Step 3

Save the changes and exit EDIT

Step 4

Switch to the Mac Environment

Step 5

Go to the PC Setup control panel

Step 6

Select Shut Down PC

Step 7

Select Restart PC

Now the PRO_ORG.EXE program should work.

NOTE: PC Setup 1.5 enables the Write Back feature and offers no way to turn it off. Apple is investigating a solution to the issue for those who need the use of the FM Pro Organ. This can also affect Power Macintosh 6100 computers with the DOS Compatibility Card.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

03 Feb 1997 - Added note regarding PC Setup version 1.5.

LaserWriter 8 Driver: Printing an EPS File (1/96)

Revised: 1/23/96
Security: Everyone

LaserWriter 8 Driver: Printing an EPS File (1/96)

Article Created: 23 January 1996

TOPIC -----

I print an EPS file with the LaserWriter 8 printer driver options, I then click the Save button, and a dialog box appears with EPS and font options as shown below:

Begin_Table

Option Format: PostScript print
 EPS Mac standard preview
 EPS Mac enhanced preview
 EPS no preview

Font Options: No fonts
 All fonts

End_Table

I want to print to an EPS file with all fonts included and then import the EPS file into Quark Express. In order to ensure the import is correct a preview of the EPS file in Quark Express should be available after importing. With the options listed above it seems this would be possible, however, I cannot get Quark Express to work this way.

How does preview in EPS files work? What are the differences between standard and preview format? What format should I use to enable standard Macintosh applications preview the content of a EPS file?

DISCUSSION -----

We have enclosed a description of all of the options when you select a destination of Save to disk. The EPS Standard Preview contains an equivalent 72 dots per inch (dpi) bit image copy of the original applications image. The Enhanced Preview is a copy of the file as originally generated by the

application. Quark XPress can import and print EPS, but it has an issue displaying these images -- an issue Quark intends to resolve. They could not provide a time frame for when the fix will be available, so you may wish to check back with them periodically.

Being able to import and/or display EPS files are options you will find in some but not all applications. It is up to the discretion of the developer to support or not support this feature.

In a EPS file, the PostScript is stored in the data fork, and the screen image is stored as a PICT resource #256. For a third-party application to display the EPS file, the application must look for the PICT resource to read and display the image. Again, not all applications support this feature.

Included below are descriptions of the Save options

The LaserWriter 8 dialog offers many options including the ability to select a Destination that specifies where to send the driver's output:

- Printer: send to hardcopy printer.
- File: send to a disk file.

If you are using LaserWriter 8f or Fax PPD, another Destination becomes available:

- Fax: send to a fax-capable output device for fax transmission.

After selecting the Save you are given a choice of formats in which to save the file:

PostScript Job

A copy of the driver's PostScript output, exactly as it would have been sent to the output device. The file is formatted for the currently targeted output device with whatever features and options are currently in effect, and conforms fully to Adobe Document Structuring Convention (DSC).

EPS Mac Standard Preview

A single page image (typically an illustration) in Encapsulated PostScript form in the file's data fork, along with an equivalent 72-dpi bit image in the resource fork for displaying the page on the Macintosh screen. The bit image is obtained by playing back and rasterizing the 'PICT' resource representing the page in the document's spool file, as originally generated by the client program.

EPS Mac Enhanced Preview

A single page image (typically an illustration) in Encapsulated PostScript form in the file's data fork, along with an equivalent 'PICT' resource in the resource fork for displaying the page on the Macintosh screen. This is a copy of

the same 'PICT' representing the page in the document's spool file, as originally generated by the client program.

EPS No Preview

A single page image (typically an illustration) in Encapsulated PostScript form in the file's data fork, but without an associated preview image in the resource fork. This form is intended for transfer to other, non-Macintosh platforms.

Font Inclusion controls the inclusion of downloadable fonts in the PostScript output file:

None

Includes no fonts; assume all needed fonts are already available on the target device. In place of the fonts themselves, the PostScript output will include a DSC %%IncludeFont comment for each font used in the document.

All

Include all fonts used in the document that are available on the host Macintosh.

All But Standard 13

Include all fonts used in the document that are available on the host Macintosh, except the core set of thirteen standard typefaces that are built into virtually all PostScript printers (Times-Roman, Times-Bold, Helvetica-Bold, Helvetica-Oblique, Helvetica-BoldOblique, Courier, Courier-Bold, Courier-Oblique, Courier-BoldOblique, and Symbol).

ASCII/Binary

Specifies whether to save the output file in 7-bit ASCII or 8-bit binary format:

ASCII Save file in 7-bit ASCII format.

The resulting file contains no characters outside the range 32-127 (\$20-\$7F). In particular, it contains no control characters, and thus is suitable for transmission across ASCII-transparent communication channels such as asynchronous serial.

Binary Save file in 8-bit binary format.

The resulting file is typically smaller than the corresponding file in ASCII format (particularly if it contains sampled image data), but is suitable for transmission only across 8-bit-transparent communication channels.

Level 1 Compatible/Level 2 Only

Specifies the level of PostScript compatibility for the output file:

Level 1 Compatible: Compatible with all PostScript devices.

The file includes code to test the level of the device's PostScript interpreter and emulate the effects of Level 2 features on devices that do not support them directly. Level 2 features that cannot be emulated efficiently in Level 1 are suppressed.

Level 2 Only: Compatible with PostScript Level 2 devices only.

Assumes the availability of all Level 2 features and generates no level-checking or emulation code. The file may include Level 2 features (such as data compression for sampled images) that cannot be emulated efficiently in Level 1. Output files in Level 1 Compatible format tend to be larger than Level 2 Only files, both because of the additional emulation code they contain and because they cannot take advantage of Level 2 data-compression techniques. Files in Level 2 Only format are smaller, but will typically cause PostScript errors when printed on a Level 1 device.

The default setting is Level 1 Compatible.

ClarisWorks: Only One User Can Open Server Based Document (1/96)

Revised: 1/23/96
Security: Everyone

ClarisWorks: Only One User Can Open Server Based Document (1/96)

=====

Article Created: 23 January 1996

TOPIC -----

When more than one user attempts to open the same ClarisWorks 4.0 document that resides on an AppleShare server, the error message "That file is in use by another application" appears. Other applications allow multiple users to access the same document although some only allow the second user read-only access.

Why does ClarisWorks not allow simultaneous multiple user access to the same document?

DISCUSSION -----

Claris support informed us when a ClarisWorks file that resides on a AppleShare server is opened by an AppleShare client, ClarisWorks locks the file so no other client can open it. This is how ClarisWorks handles files that reside on a server.

For more information on this, contact Claris technical support.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a Claris' address and phone number.

Control Strip 1.3: Read Me (1/96)

Revised: 1/24/96
Security: Everyone

Control Strip 1.3: Read Me (1/96)

=====

Article Created: 23 January 1996

TOPIC -----

This article contains the ReadMe included with Control Strip software v1.3. This software is available online as part of the Display Software version 2.0.

DISCUSSION -----

About the Control Strip

The Control Strip is a new way of controlling certain settings from your desktop without opening control panels. You can change the following settings with the Control Strip:

- Monitor BitDepth lets you change the number of colors on your screen.
- Monitor Resolution lets you change the size of the screen.
- Sound Volume lets you change the volume of the system sound.

When you start up your Macintosh after installing Display Software 2.0, you will notice the Control Strip at the lower-left edge of your screen. (Note: on some models you will see different modules in the Control Strip.)

IMPORTANT Although the Control Strip appears on top of other applications' windows, you must be in the Finder to use it. If the Control Strip doesn't seem to be responding, return to the Finder by choosing Finder from the Application menu.

Using the Control Strip Modules

=====

Changing the number of colors displayed

The BitDepth module changes the number of colors displayed on your monitors. To change the number of colors, press the BitDepth module and choose the number of colors you want from the menu. (The monitors are identified by the same numbers used in the Monitors control panel.) The change takes effect immediately.

Changing the screen size

Resolution changes the screen size of Apple Multiple Scan monitors. (Other monitors have a fixed screen size.) To change the screen size, press the Resolution module and choose the screen size you want from the menu. (The monitors are identified by the same numbers used in the Monitors control panel.) The change takes effect immediately.

Note: Some applications do not support resolution switching from the Control Strip.

If resolution switching does not work, try quitting the application, changing the resolution, and then restarting the application.

Changing the sound volume

Sound Volume changes the volume of the system beep. To change the beep volume, press the Sound Volume module and choose the volume you want from the menu. The softest setting is 1, and 7 is the loudest. You hear the system beep at the new volume. If you choose a setting of 0, sound is muted.

Note: You cannot use Sound Volume to change the volume of sound from a CD or a CD-ROM. To change the volume of sound from a CD-ROM, you must use the AppleCD Audio Player (located in the Apple menu).

Working With the Control Strip

You can move, collapse, and expand the Control Strip, and you can change the order of the modules.

- To move the Control Strip, hold down the Option key on your keyboard and drag the tab at the right end of the Control Strip. The Control Strip always stays on the left or right edge of your screen. If you drag more than halfway across the screen, the Control Strip moves to the other edge. If you have more than one monitor, you can drag the Control Strip to the left or right edge of the other monitor.

- To make the Control Strip shorter or longer, drag the tab to the left or right.

- To see hidden modules when the Control Strip is not expanded to its full size, click the right and left arrows.

- To collapse the Control Strip to its smallest size, click the tab or the box. To expand the collapsed Control Strip to its original size, click the tab.

- To move a module to a new position in the Control Strip, hold down the Option key on the keyboard and drag the control to where you want it.

Configuring the Control Strip

With the Control Strip control panel, you can show and hide the Control Strip and choose a keyboard command to show/hide the Control Strip. You can also choose the font that appears in the Control Strip menus.

- To show the Control Strip, click Show Control Strip. To hide the Control Strip, click Hide Control Strip.
- To turn on a keyboard command for showing and hiding the Control Strip, click "Hot key to show/hide." The keyboard command for showing and hiding the Control Strip appears in the "Current hot key" window.
- To change the keyboard command, click "Define hot key." A box appears. Press the keys you want to use, then click OK. You must include either the `⌘` (Command) key or a function key (F1-F15). You can also include other keys.
- To change the font that appears in the Control Strip menus, choose a font from the Font pop-up menu and a size from the Size pop-up menu.

Display Software 2.0: Read Me (1/96)

Revised: 1/24/96
Security: Everyone

Display Software 2.0: Read Me (1/96)

=====

Article Created: 23 January 1996

TOPIC -----

This article contains the ReadMe on the Apple Multiple Scan Display Software 2.0 available online.

DISCUSSION -----

Apple Multiple Scan Display Software 2.0

The Display Software 2.0 package includes the following features:

- Display Enabler 2.0
- ColorSync 2.0 and ColorSync profiles
- Control Strip 1.3 with Monitor Resolution, BitDepth, and Sound Volume features
- Energy Saver 1.1

You can use this software to change the resolution of your monitor, adjust the number of colors it can display, and control your monitor's energy-saving features.

System Requirements

=====

To use Display Software 2.0, you need:

- A computer with version 7.1 or later of the Mac OS software
- Any Apple Multiple Scan Display

Display Software 2.0 does not work with PowerBook 100 series computers or with PowerBook Duo computers other than the 280 and 280c. To use Display Software 2.0 with the PowerBook Duo 280 and 280c, you must connect the PowerBook to a Duo Dock.

How to Install Display Software 2.0

=====

To install Display Software 2.0, follow these steps:

Step 1

Insert the Display Software disk into a disk drive.

Step 2

Double-click the Installer icon to open it. A welcome message appears.

Step 3

Click OK.

Step 4

Make sure the disk named in the Installer window is the disk on which you want to install the software. If not, click Switch Disk until the correct name appears.

Step 5

Click Install to begin installation.

Step 6

When installation is finished, follow the instructions on the screen to begin using your new software.

Step 7

Be sure to read the file About Control Strip to learn about your new software.

Using ColorSync System Profiles

=====

With ColorSync, different Apple monitors can display colors in a consistent way. You can also fine-tune the way your monitor displays color.

To set a ColorSync profile for your monitor, follow these steps:

Step 1

Open the ColorSync System Profile control panel.

Step 3

Click Set Profile.

Step 3

In the dialog box that appears, locate the files that have the name of your monitor. Click the profile you want.

Note: If you have an Apple Multiple Scan 14 Display, you were previously instructed to use the profile for the Apple Multiple Scan 15 Display. You now have choices specifically for your monitor.

About the ColorSync choices

The ColorSync choices let you choose from several white point settings for your monitor. White point is a measure of the color content of light.

- 9300 is the standard for most computer monitors and high-definition television (HDTV).
- D50 is the standard for most graphic art work.
- D65 approximates the color of light from the midday sun.

Configuring Your Monitors

The features of the Monitors control panel have not changed. To learn more about the Monitors control panel, see the documentation or online help that came with your computer or your system software. (Some models come with a different control panel for configuring monitors.)

Tip: To set the screen resolution and configure your video card, you click the Options button in the Monitors control panel. To see more choices, hold down the Option key on your keyboard as you click the Options button.

At the bottom of the control panel, you can choose whether to change the settings when you close the control panel or when you restart your computer.

Saving Energy

=====

Your Multiple Scan Display is designed to save energy by putting itself to sleep when you are away from the computer for a while. You can control this feature using the Energy Saver control panel. The Energy Saver control panel has not changed.

Using the Control Strip

=====

The Control Strip is a new way of changing certain settings from your desktop without opening control panels. With the Control Strip, you can change the number of colors on your screen, the resolution (size) of the screen, and the volume of the system sound.

To learn more about the Control Strip, read the file About Control Strip included in this package.

Troubleshooting

=====

This section lists solutions to potential problems with your new display software.

I'm trying to change the monitor resolution, and I don't see the resolution I want.

You can see additional resolution choices in the Monitors control panel if you hold down the Option key on your keyboard while you click the Options button in the control panel. In the list that appears, click the resolution you want. (Some models come with a different control panel for configuring monitors. See the on-screen help that came with your computer.)

Note: Some of the items in this list will not work properly with your monitor. If you choose a resolution that doesn't work with your monitor, you may see a message, or your monitor may go blank or show static. After approximately 15 seconds, your monitor should revert to a usable resolution. If it does not, restart your computer.

After I change the screen resolution, a window is stuck, halfway off the screen, or missing.

Try one of the following:

- If you changed the resolution in the Monitors control panel, make sure the control panel is closed before trying to use another window.
- Quit the program whose window is missing and then open it again.
- If the program has a Windows menu, use it to hide the problem window and then show it again.
- Go back to the resolution you were using, close the window, change the resolution, and then reopen the window.
- If you have problems with a particular program, contact the publisher of that program. Not all programs take advantage of the Multiple Scan Display's new features.

If you choose the 800 x 600 (72 Hz) resolution on a Multiple Scan 14 Display, a software problem may prevent you from seeing the whole screen. Use the 60 Hz setting instead.

After I change the number of colors displayed on the screen, the colors don't look right.

Try one of the following:

- Quit the program you're running and start it again.
- Go back to the number of colors you were using.

After I change the screen resolution, icons move.

Changing the screen resolution affects how information can be displayed on your screen. The display software may automatically reposition icons after you change the screen resolution.

After I attached a new monitor to my computer, the new monitor's screen is blank or shows "garbage" or "snow."

The computer may not have recognized the monitor. Try the following: Turn off the computer and disconnect the new monitor. Start the computer with no monitor attached. Wait a minute or so for the computer to finish turning itself on. Turn off the computer again and reattach the new monitor.

My monitor does not go to sleep.

Some monitors, computers, and video cards do not support the Energy Saver feature. See the documentation that came with your monitor and video card for more information.

If you have a Power Macintosh 9500, you can get an upgrade to your software that allows your monitor to work with Energy Saver. Call the Apple Service and Support number found in the service and support information that came with your computer.

When I use both Energy Saver and a screen saver program, the screen freezes.

The screen saver program may be conflicting with Energy Saver. Turn off either the screen saver program or the Energy Saver control panel.

My monitor starts up in black and white.

If you've just installed a new video card such as the Macintosh 24AC, the monitor will start up in black and white the first time you start the computer. Switch it to color after startup.

If your Multiple Scan 15 Display is connected to a Macintosh Quadra 610, 650, 700, or 950, a Macintosh LC 475 or a Power Macintosh 6100, the monitor may start up in black and white. Switch it to color after startup.

I see two resolution options labeled 640x870 (75 Hz).

If you're using the Macintosh 24AC video card, you may see two apparently identical resolution selections. The first option sets your monitor to display millions of colors, and the second option sets your monitor to display 256 colors.

When I change resolutions, the monitor goes blank.

If your monitor is connected to the Macintosh 24AC video card, the monitor may go blank for 15 seconds when you select a resolution that does not work with your monitor. Try selecting another resolution.

The image is too small.

If you're using a Multiple Scan 1705 connected to the Macintosh 24AC video card, the image may appear too small at the resolution 1024 x 768 (60 Hz). Try a different resolution.

IMPORTANT Some programs and video cards do not take advantage of the Multiple Scan Display's new features. If you experience problems with your application programs or video cards, contact the publisher or manufacturer.

Acrobat Reader Fonts & QuickDraw GX Turned On/Off (1/97)

Revised: 1/6/97
Security: Everyone

Acrobat Reader Fonts & QuickDraw GX Turned On/Off (1/97)

=====

Article Created: 23 January 1996
Article Reviewed/Updated: 3 January 1997

TOPIC -----

I am using Adobe's Acrobat Reader on my Macintosh computer. I get font related error messages at startup after I switch between QuickDraw GX and standard QuickDraw.

DISCUSSION -----

Acrobat Reader versions earlier than 2.0.1 are incompatible with QuickDraw GX. Acrobat Reader versions 2.0.1 and later are compatible with QuickDraw GX but the correct fonts must be installed before restarting with QuickDraw GX active. Similarly, if the you want to turn QuickDraw GX off and Acrobat is already installed, the corresponding fonts will need to be installed before restarting with QuickDraw GX turned off.

If the correct fonts for QuickDraw GX are not installed before restarting, the computer will produce the message "The installed substitute fonts are designed for use with Standard QuickDraw. Please remove them and install the QuickDraw GX versions".

If the correct fonts for non-QuickDraw GX are not installed before restarting, the computer will produce the message "The installed substitute fonts are designed for use with QuickDraw GX. Please remove them and install the standard versions".

If the Acrobat Reader program is launched while either of the incorrect fonts are present the error message, "The current versions of system software, ATM, and substitution fonts required to run Acrobat Reader are not synchronized. Please re-install Acrobat Reader to correct this problem" will appear.

Switching between the contexts of having QuickDraw GX on or off and using Acrobat Reader can be done in one of two ways:

- Restart the computer in the desired mode (QuickDraw GX on or off) and run the Acrobat Reader installer. The installer will recognize that QuickDraw GX is on or off and will install the proper fonts into the Fonts folder. After running the installer, you will need to restart once more.
- Keep a separate folder containing both the GX and non-GX versions of the fonts that Acrobat Reader installs. When you want to switch QuickDraw GX on or off, drag (or hold down the Option key and drag to copy) the appropriate fonts into the Fonts folder. After restarting, the correct fonts will be installed and Acrobat Reader will function correctly. This method is preferable to the first since it only requires one restart.

The installed fonts for the QuickDraw GX environment:

- Adobe Sans MM (TrueType suitcase)
- Adobe Serif MM (TrueType suitcase)

The installed fonts for the standard QuickDraw environment:

- Adobe Sans MM (bitmapped font suitcase)
- Adobe Serif MM (bitmapped font suitcase)
- AdobeSanMM (PostScript font)
- AdobeSerMM (PostScript font)

NOTE: Although the two versions of the "Adobe Sans MM" and "Adobe Serif MM" suitcases have the same name, Acrobat Reader will only recognize the fonts from the correct environment. That is, you cannot keep the two PostScript fonts and the two TrueType suitcases in the Fonts folder and have Acrobat Reader automatically recognize the correct one whether QuickDraw GX is on or off.

Macintosh Performa 6360 and 6400 Computers

Performa 6360 and 6400 computers come with Adobe Acrobat Reader pre-installed. This version of Acrobat Reader does not include the GX-compatible fonts referred to in this article. There is not a regular Adobe Acrobat installer on the computer's CD-ROM or on hard disk; Adobe Acrobat is part of the Restore All Software bundle.

If you experience this font error as described above after installing QuickDraw GX 1.1.3, obtain a copy of Acrobat Reader (their web site is <http://www.adobe.com>) and install it. Also turning off the ATM control panel with the Extensions Manager control panel will stop this error.

As described above once you have installed the QuickDraw GX Acrobat fonts, and turn GX off, you will get an error message stating, "The installed substitution fonts are designed for use with QuickDraw GX. Please remove them and install the standard QuickDraw versions." Follow the workarounds above for switching between QuickDraw GX and Standard QuickDraw.

Article Change History:

03 Jan 1997 - Added Performa 6360 and 6400 information, changed title.

MegaPhone & GeoPort: Telephone Manager, Telephone Tool Msg 2/96

Revised: 2/8/96
Security: Everyone

MegaPhone & GeoPort: Telephone Manager, Telephone Tool Msg 2/96

Article Created: 24 January 1996
Article Reviewed/Updated: 8 February 1996

TOPIC -----

1) I have a GeoPort Telecom Adapter connected to my Power Macintosh computer, and MegaPhone has been working properly. I had to reinstall system software and now I get this error message when I try to start MegaPhone: "Telephone Manager 2.0 (or later) is required. Please install the software before launching Megaphone."

TelePhone Manager 2.1 is in my Extensions folder and I can send and receive faxes fine. What is wrong?

2) Sometimes when opening MegaPhone, I have received a message saying the "GeoPort Telephone Tool could not be configured. DemoDialer Telephone Tool has temporarily been selected. You will not be able to make or receive calls with this tool.; invalid telephone terminal (configuration problem)."

What can cause this message and how do I correct it? Again, I have the GeoPort Telephone Tool in my Extensions folder.

DISCUSSION -----

1) "Telephone Manager 2.0 (or later) is required. Please install the software before launching Megaphone."

The Telephone Manager is installed by the Apple Telecom 2.x software installer. In addition to the visible extension and control panel, the installer also modifies resources in the System suitcase file. If you reinstall the system software, these resources will be absent from the new System suitcase and the Telephone Manager will not be recognized.

You are able to send faxes because the current fax software does not access the Telephone Manager. Most current data communications software titles do not access the Telephone Manager either.

To resolve this, you need to perform an Easy Install of the Apple Telecom software. This will add the necessary resources to the System suitcase file.

2) "GeoPort Telephone Tool could not be configured. DemoDialer Telephone Tool has temporarily been selected. You will not be able to make or receive calls with this tool.; invalid telephone terminal (configuration problem)."

The two main reasons for this second message to appear is if you do not have the GeoPort Telecom Adapter connected to the GeoPort itself or the GeoPort Telephone Tool is actually missing. In some cases, corrupted Telecom software or preference file could cause a similar message.

Follow these steps to troubleshoot this message:

Step 1

With the power off to the computer, make sure the GeoPort Telecom Adapter is connected to either the printer or the modem port. If you have a Macintosh Quadra 840AV or 660AV computer, you must use the modem port.

Disconnect and reconnect the cable to make sure it is in snugly. Confirm the adapter is connected by sending a fax or connect with a data communications program.

Step 2

Make sure that GeoPort Telephone Tool is in the Extensions folder of the System Folder, if it is not, reinstall the Apple Telecom software.

If the tool is installed and you are able to fax or connect to an online service drag the MegaPhone Prefs file to the Trash. The MegaPhone Prefs file can be located by the path:

System Folder -> Preferences Folder -> Cypress -> MegaPhone Prefs

A new copy of the MegaPhone Prefs will be created the next time you open MegaPhone.

Step 3

If you still get the message, drag both the Telephone Manager and the GeoPort Telephone Tool to the Trash and perform an easy install from the Apple Telecom disks.

Article Change History:

08 Feb 1996 - Added second error message and troubleshooting.

Newton 2.0 OS: Alarm Volume Setting Muted (1/96)

Revised: 1/24/96
Security: Everyone

Newton 2.0 OS: Alarm Volume Setting Muted (1/96)

=====

Article Created: 24 January 1996

TOPIC -----

When I use the Prefs in the Extras draw to adjust the alarm volume to zero, then back to a different volume, the volume on the entire MessagePad gets muted. The Newton device then will not allow me adjust the volume, even though I change the setting in the Extras drawer.

DISCUSSION -----

This is a problem with the Alarm volume setting. The workaround is to turn the MessagePad off and back on. Next, open the Extras drawer and adjust the volume. The sound should return.

This will be fixed in a future System Update.

Macintosh and NetWare Remote Access (1/96)

Revised: 1/24/96
Security: Everyone

Macintosh and NetWare Remote Access (1/96)

=====

Article Created: 24 January 1996

TOPIC -----

This article describes Macintosh and NetWare remote access. This information is taken from Novell Technical Information Document ID 350124, revision 1, dated 29 June 1994. This information is being provided by as information only. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

DISCUSSION -----

DISCLAIMER

THE ORIGIN OF THIS INFORMATION MAY BE INTERNAL OR EXTERNAL TO NOVELL. NOVELL MAKES EVERY EFFORT WITHIN ITS MEANS TO VERIFY THIS INFORMATION. HOWEVER, THE INFORMATION PROVIDED IN THIS DOCUMENT IS FOR YOUR INFORMATION ONLY. NOVELL MAKES NO EXPLICIT OR IMPLIED CLAIMS TO THE VALIDITY OF THIS INFORMATION.

ISSUE

Assuming the user is using a dial in method (no WAN support at the remote site) there are two classes of dial up solutions:

1) Accessing the network as a Macintosh client workstation

a) Using ARA (AppleTalk Remote Access) the user (with ARA client support -- available in the modem software, for example) can dial into an ARA server. An ARA server can be a NetWare file server with NetWare Connect loaded with ARA support. But there are other ARA server solutions available.

After "connecting" to the ARA server, the user is then able to access all the services of that network as if the client were really physically resident on that LAN. However, be aware this solution can yield poor performance depending on the speed of the modem link.

b) Using Faralon's Timbuktu Remote, the remote Macintosh user can dial into a locally connected Macintosh (with the Timbuktu Host module operational) and gain access to the network. However in contrast to the ARA solution, the Timbuktu solution allows the remote user to essentially take control of the local Macintosh. For example when saving a file in the Timbuktu environment, the user is actually saving the file to locally connected Macintosh's disk, not to the remote disk.

2) Accessing the network as a DOS client

a) Using OnLAN/Mac and the NetWare Access Server (NAS), the remote Macintosh client can dial into the NAS, take control of one of the 16 available NCP/IPX sessions and access the network as if the remote Macintosh client were really a locally connected DOS client. At this point, the remote OnLAN/Mac Macintosh client will show a main program window with a DOS prompt and an operating system that essentially is MS DOS. From within this program, users can run DOS software (like the NetWare LOGIN.EXE or LOGOUT.EXE utilities for example) as if they were a locally connected DOS client.

b) Using Argosy's RunPC/Remote, the remote Macintosh client can dial into a locally connected DOS client. This solution is similar to the Timbuktu solution in that the remote client takes control of the local client. But in this case the local client is a DOS workstation, not a Macintosh.

Macintosh: S-Video Port Confused with the ADB Port (1/96)

Revised: 1/24/96
Security: Everyone

Macintosh: S-Video Port Confused with the ADB Port (1/96)

=====

Article Created: 24 January 1996

TOPIC -----

The mouse or keyboard on my new Macintosh computer does not work. I have tried different mice, different keyboards, and different ADB cables. I have tried starting up from my system software CD and startup floppy disk, and still get no response from either my keyboard or mouse. I know I am connected properly because the cable fits in the port.

What is wrong?

DISCUSSION -----

Since you have tested for bad cables, mouse devices, keyboards, and software, make sure you are connected to the actual ADB port and not just a port into which the cable fits.

Many new Macintosh computers come with AV capabilities or installable AV options. The S-Video port on computers with AV capabilities has seven instead of four pins but an ADB cable will fit in this port. You may have attached your mouse or keyboard to this S-Video port. The icon next to the S-Video port is a box with an S in it or a Camera outline with an S in it.

Make sure the ADB cable is connected to the ADB port. The graphic next to the ADB port has a vertical line that connects with two dots to the left and one dot to the right:

Begin_Graphic

```
•--|  
  |--•  
•--|  
  |
```

End_Graphic

If an AV video card is added to the following computers, the S-Video port could be mistaken for an ADB port:

Macintosh LC 580
Macintosh LC 630
Macintosh Quadra 630
Power Macintosh 5200/75 LC
Power Macintosh 5300/100 LC
Power Macintosh 6300/100 LC
Macintosh Performa 580
Macintosh Performa 630 series
Macintosh Performa 640CD DOS Compatible
Macintosh Performa 5200 series
Macintosh Performa 5300 series
Macintosh Performa 6100 series
Macintosh Performa 6200 series
Macintosh Performa 6300CD

The following computers have an S-Video port built-in:

Macintosh 660 AV
Macintosh 840 AV
Power Macintosh 6100 AV Series
Power Macintosh 7100 AV Series
Power Macintosh 8100 AV Series
Power Macintosh 7500
Power Macintosh 8500

Apple System Profiler 1.0: What Information Does it Show? (7/96)

Revised: 7/3/96
Security: Everyone

Apple System Profiler 1.0: What Information Does it Show? (7/96)

=====

Article Created: 24 January 1996
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article describes the Apple System Profiler 1.0 which is an application included with System 7.5.3 and the System 7.5 Update 2.0.

DISCUSSION -----

Apple System Profiler is a new tool that will allow you to gather information about the configuration of your Macintosh system. In addition, the information it reports may be needed if you place a call to the Apple Assistance Center (AAC).

If you have one of the computers listed below, you should install the Apple System Profiler on your computer now. Double-click on the Apple System Profiler Installer located in your Apple Extras folder. The Apple System Profiler will be installed in the Apple Menu on your computer.

The Apple System Profiler 1.0 is compatible with the following computers running System 7.5.3:

Power Macintosh 9500, 8500, 7500, 7200, 8100, 7100 and 6100 series.
PowerBook 5300, 2300 and 190 series.
Performa 5200, 5300, 6200 and 6300 series.

The utility gathers, summarizes, and delivers key pieces of system configuration information such as processor clock speed, disk cache size, and Apple and non-Apple installed extensions. After you install the application and run it, a profiler "code" is generated. If you call the AAC, the support technician can use this code to determine the configuration of your machine. This information will help reduce the amount of time needed to gather configuration information on your computer.

There are six information sets available under the Select menu. The information

gathered by each set is:

System Overview:

Customer Care Code: (code for AAC agent to determine configuration)
Machine: (type of computer including processor speed)
Machine ID: (unique ID indicating computer type)
Finder: (version)
System: (version)
Processor: (type)
Active Enabler: (enabler name, version)
Memory Installed: (RAM Installed)
Virtual Memory: (on or off)
Total Memory: (including virtual)
Disk Cache: (on or off, amount)
AppleTalk: (version, on or off (Open Transport or AppleTalk Phase))
File Sharing: (on or off)
Startup Device: (SCSI bus number of startup device, SCSI ID number of startup device, device name)
Chosen Printer: (chooser selection's driver version and zone location)

Volume Information:

Number of Volumes Found
List of Volume Names, clicking on each volume name gives this information:
Name: (volume name)
Kind: (hard disk, CD-ROM)
Size: (total size)
Space Available: (free space left)
Bus: (SCSI Bus number)
ID: (SCSI ID number)
Mounted: (yes or no)
Write Protected: (yes or no)
Where: (Driver and version number)

Device Information:

Total SCSI Buses Found: (number of buses)
Number of SCSI Devices Found on each bus
List of SCSI ID Numbers: (type of device assigned to each number) clicking on each device name gives this information:
Device Type: (hard drive, CD-ROM Drive)
Bus: (SCSI Bus number)
ID: (SCSI ID number)
Capacity: (total formatted storage space)
Vendor: (manufacturer's name)
Product ID: (unique drive identification code)
Revision Number: (ROM Revision)
Interface Type: (SCSI, SCSI-2)
Removable Media: (yes or no)
HFS Partitions: (number of partitions)

Control Panel Information:

Lists total Control Panels found with version numbers in parenthesis, bullets to the left of each control panel indicate that it is enabled

Shows: All Control Panels, Apple Only, Non-Apple

Clicking on each control panel in the list reveals its location on the volume

Extension Information:

Lists total Extensions found with version numbers in parenthesis, bullets to the left of each extension indicate that it is enabled

Shows: All Extensions, Apple Only, Non-Apple

Clicking on each extension in the list reveals its location on the volume

System Folder Information:

Lists all folders found which contain a System and Finder, indicates the startup System Folder with a Macintosh icon

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Security: Everyone

QuickDraw 3D Glossary of Terms - P to S (1/96)

Article Created: 17 November 1995
Article Reviewed/Updated: 25 January 1996

TOPIC -----

This article is a glossary of terms for QuickDraw 3D.

DISCUSSION -----

parallel projection: A method of projecting a model onto a viewing plane that uses parallel projectors. See also oblique projection, orthographic projection. Compare perspective projection.
parameterization A parametric function that picks out all points on a geometric object, such as a pixmap or a surface. Compare surface parameterization.

parametric curve: Any curve whose points are described by one or more parametric functions. A two-dimensional parametric curve can be described by the parametric functions $x = x(t)$ and $y = y(t)$. A three-dimensional parametric curve is described by the parametric functions $x = x(t)$, $y = y(t)$, and $z = z(t)$. Compare B-spline polynomial, nonuniform rational B-spline (NURB).

parametric equation: See parametric function.

parametric function: A function of one or more parameters (often denoted by s and t or u and v).

parametric point: A position in two- or three-dimensional space picked out by a parametric function. Defined by the TQ3Param2D and TQ3Param3D data types. Compare point, point object, rational point.

parent class: The class (if any) of which a given class is a subclass. In other words, a class' parent class is the class immediately above that class in the QuickDraw 3D class hierarchy. For example, the shape class is the parent class of the light class. Also called a base class or a superclass.

patch: A portion of a surface defined by a set of points. Compare NURB patch.

perspective foreshortening: A feature of perspective projections wherein the size of a projected object varies inversely with the distance of the object from the center of projection.

perspective projection: A method of projecting a model onto a viewing plane that uses nonparallel projectors. Compare parallel projection.

Phong illumination: A method of calculating the illumination of a point on a surface based on both diffuse reflection and specular reflection. Compare Lambert illumination, null illumination.

Phong illumination shader: An illumination shader that implements a Phong illumination model. Compare Lambert illumination shader, null illumination shader.

Phong shading: A method of shading surfaces in which the incident light color and intensity are calculated for a series of points along each edge of a polygon and then interpolated across the entire polygon. Compare constant shading, Gouraud shading.

pick: (n.) See pick object. (v.) To determine whether a specified object is close enough to a pick geometry for a hit to be recorded.

pick data structure: A data structure that contains basic information about a pick object. Defined by the TQ3PickData data type.

pick detail: See hit information mask.

pick geometry: The geometric object used in any picking method.

pick hit: See hit.

pick hit list: See hit list.

picking: The process of identifying the objects in a view that are close to a specified geometric object.
picking flag A binary flag in a group state value that determines whether a group is eligible for picking. Compare drawable flag, inline flag.

picking ID: An arbitrary 32-bit value that you can use to determine which object was selected by a pick operation.

picking ID style: A type of style object that determines the picking ID of an object or group of objects in a model.

picking loop: A section of code in which all picking takes place. A picking loop begins with a call to the Q3View_StartPicking routine and should end when a call to Q3View_EndPicking returns some value other than kQ3ViewStatusRetraverse. A picking loop is a type of submitting loop. See also bounding loop, rendering loop, writing loop.

picking parts style: A type of QuickDraw 3D object that determines which parts

of a geometric object (for instance, a mesh) are eligible for inclusion in a hit list.

pick object: A QuickDraw 3D object that is used to select geometric objects in a model that are close to a specified geometric object. A pick object is an instance of the TQ3PickObject class.

pick origin: A point in space that determines the origin of sorting hits. Compare metric pick object.

pick parts mask: A value that indicates the kinds of objects placed in a hit list.

picture area: The portion of a window occupied by a viewer object that contains the displayed image.

pixel image: See pixmap

pixel map: See pixmap

pixmap: A two-dimensional array of values, each of which represents the color of one pixel. Defined by the TQ3Pixmap data type. See also bitmap, storage pixmap.

pixmap draw context: A draw context that is associated with a pixmap.

pixmap draw context data structure: A data structure that contains information about a pixmap draw context. Defined by the TQ3PixmapDrawContextData data type.

pixmap texture object: A texture object in which the texture is defined by a pixmap.

planar: Contained completely in two dimensions (as, for example, a circle). See also spatial.

plane constant: The value d in the plane equation $ax+by+cz+d = 0$.

plan elevation projection: See top elevation projection.

plane equation: An equation that defines a plane. A plane equation can always be reduced to the form $ax+by+cz+d = 0$. Defined by the TQ3PlaneEquation data type.

point: A dimensionless position in two- or three-dimensional space. Defined by the TQ3Point2D and TQ3Point3D data types. Compare parametric point, point object, rational point.
point light A light source that emits rays of light in all directions from a specific location.

point light data structure: A data structure that contains information about a point light. Defined by the TQ3PointLightData data type.

point object: A dimensionless position in three-dimensional space, with an optional set of attributes. Defined by the TQ3PointData data type.

point of interest: The point in world space at which a camera is aimed. The

point of interest and the camera location determine the viewing direction.

point pick object: See window-point pick object.

polar coordinate system: A system of assigning planar positions to objects in terms of their distances (r) from a point (the polar origin, or pole) along a ray that forms a given angle (q) with a coordinate line (the polar axis). The polar origin has the polar coordinates $(0, q)$, for any angle q . Compare Cartesian coordinate system, spherical coordinate system.

polar axis: A fixed ray that radiates from the polar origin, in terms of which polar coordinates are determined. Also called the initial line.

polar origin: The point in a plane from which the polar axis radiates. Also called the pole.

polar point: A point in a plane described using polar coordinates.

pole: See polar origin.

polygon: A closed plane figure. See general polygon, simple polygon.

polygon mesh: A mesh whose faces are composed of polygons.

polyhedron: A solid figure composed of faces.

postmultiplied: A term that describes the order in which matrices are multiplied. Matrix $[A]$ is postmultiplied by matrix $[B]$ if matrix $[A]$ is replaced by $[A] \times [B]$. Compare premultiplied.

premultiplied: A term that describes the order in which matrices are multiplied. Matrix $[A]$ is premultiplied by matrix $[B]$ if matrix $[A]$ is replaced by $[B] \times [A]$. Compare postmultiplied.

primitive: See geometric primitive.

private: See opaque.

projection: (1) A method of mapping three-dimensional objects into two dimensions. See also parallel projection, perspective projection. Compare camera object. (2) The image on the view plane that results from mapping three-dimensional objects into two dimensions.

projection plane: See view plane.

projective transform: See frustum-to-window transform.

projector: A ray that intersects both a point on an object in a model and the view plane, thereby projecting the object in the model onto the view plane.

prototype: The object (or collection of objects) represented in a model. Compare model, synthetic. prototypical Of or pertaining to a prototype. Compare model, synthetic.

proxy display group: See I/O proxy display group.

quaternion: A quadruple of floating-point numbers that obeys the laws of quaternion arithmetic. Defined by the TQ3Quaternion data type.

quaternion transform: A type of transform that rotates and twists an object according to the mathematical properties of quaternions.

QuickDraw: A collection of system software routines on Macintosh computers that perform two-dimensional drawing on the user's screen.

QuickDraw 3D: A graphics library developed by Apple Computer, Inc., that you can use to create, configure, render, and interact with models of three-dimensional objects. You can also use QuickDraw 3D to read and write 3D data.

QuickDraw 3D class: A structure for the data that characterize QuickDraw 3D objects, together with a set of methods that operate on that data. Compare QuickDraw 3D object. See also child class, leaf class, parent class.

QuickDraw 3D class hierarchy: The hierarchical arrangement of QuickDraw 3D object classes.

QuickDraw 3D object: Any instance of a QuickDraw 3D class. See also object type.

QuickDraw 3D Object Metafile (3DMF): An extensible file format defined by Apple Computer, Inc., for storing 3D data and interchanging 3D data between applications.

QuickDraw 3D Pointing Device Manager: A set of functions that you can use to manage three-dimensional pointing devices.

QuickDraw 3D shading architecture: An environment in which shaders can be applied at various stages in the imaging pipeline.

radius vector: The ray that radiates from the polar origin and that forms a given angle with the polar axis (or two given angles with the x and z axes). A polar or spherical point lies at a given distance along the radius vector. See also polar coordinate system, spherical coordinate system.

rasterization: The process of determining values for the pixels in a rendered image. Also called scan conversion.

rational point: A dimensionless position in two- or three-dimensional space together with a floating-point weight. Defined by the TQ3RationalPoint3D and TQ3RationalPoint4D data types. Compare point.

ray: A point of origin and a direction. Defined by the TQ3Ray3D data type.

real: See prototypical.

rectangle pick object: See window-rectangle pick object.

reference count: The number of times a shared object is being accessed.

render: To create an image (on the screen or some other medium) of a model.renderer See renderer object.

renderer object: A QuickDraw 3D object that you can use to render a model—that is, to create an image from a view and a model. A renderer object is an instance of the TQ3RendererObject class.

rendering: The process of creating an image (on the screen or some other medium) of a model. See also rasterization.

rendering loop: A section of code in which all rendering takes place. A rendering loop begins with a call to the Q3View_StartRendering routine and should end when a call to Q3View_EndRendering returns some value other than kQ3ViewStatusRetraverse. A rendering loop is a type of submitting loop. See also bounding loop, picking loop, writing loop.

retained mode: A mode of defining and rendering a model in which the graphics library (for instance, QuickDraw 3D) maintains a copy of the model. See also immediate mode.

retained object: An object that is defined and rendered in retained mode. See also immediate object.

RGB color space: A color space whose three components measure the intensity of red, green, and blue.

RGB color structure: A data structure that contains information about a color. Defined by the TQ3ColorRGB data type.

right-handed coordinate system: A coordinate system that obeys the right-hand rule. In a right-handed coordinate system, positive rotations of an axis are counterclockwise. Compare left-handed coordinate system.

right-hand rule: A method of determining the direction of the positive z axis (and thereby the front of a planar surface). According to the right-hand rule, if the thumb of the right hand points in the direction of the positive x axis and the index finger points in the direction of the positive y axis, then the middle finger points in the direction of the positive z axis. Compare left-hand rule.

rotate: To reposition an object by revolving (or turning) each point of the object by the same angle around a point or axis.

rotate-about-axis transform: A type of transform that rotates an object about an arbitrary axis in space by a specified number of radians at an arbitrary point in space.

rotate-about-axis transform data structure: A data structure that contains information on a rotate transform about an arbitrary axis in space at an

arbitrary point in space. Defined by the `TQ3RotateAboutAxisTransformData` data type.

rotate-about-point transform: A type of transform that rotates an object about the x, y, or z axis by a specified number of radians at an arbitrary point in space.

rotate-about-point transform data structure: A data structure that contains information on a rotate transform about an arbitrary point in space. Defined by the `TQ3RotateAboutPointTransformData` data type. rotate button A button in the controller strip of a viewer object that, when clicked, puts the cursor into rotate mode. Subsequent dragging of the cursor in the picture area causes the displayed object to rotate in the direction in which the cursor is dragged. Compare camera angle button, distance button, move button, zoom button.

rotate transform: A type of transform that rotates an object about the x, y, or z axis at the origin by a specified number of radians.

rotate transform data structure: A data structure that contains information about a rotate transform. Defined by the `TQ3RotateTransformData` data type.

rotation: A transform that causes an object to revolve around a point or an axis. Compare rotate-about-axis transform, rotate-about-point transform, rotate transform.

scalar product: See dot product.

scale: To reposition and resize an object by multiplying the x, y, and z coordinates of each of its points by values d_x , d_y , and d_z . Compare differential scaling, uniform scaling.

scale transform: A type of transform that scales an object along the x, y, and z axes by specified values.

scan conversion: See rasterization.

scene: A combination of objects, lights, and draw context.

screen coordinate system: See window coordinate system.

screen space: See window coordinate system.

screen-space picking: The process of testing whether the projections of three-dimensional objects onto the screen intersect or are close enough to a specified two-dimensional object on the screen.

screen-space subdivision: A method of subdividing smooth curves and surfaces. In this method, the renderer subdivides a curve (or surface) into polylines (or polygons) whose sides have a maximum length of some specified number of pixels. Compare constant subdivision, world-space subdivision.

serpentine: Said of a trigridd in which quadrilaterals are divided into triangles in an alternating fashion.

set: See set object.

set object: A collection of zero or more elements, each of which has both an element type and some associated element data. A set object is an instance of the TQ3SetObject class.

shader: See shader object.

shader object: A type of QuickDraw 3D object that you can use to manipulate visual effects that depend on the illumination provided by a view's group of lights, the color and other material properties (such as the reflectance and texture) of surfaces in a model, and the position and orientation of the lights and objects in a model. A shader object is an instance of the TQ3ShaderObject class. shading parameterization A surface uv parameterization used when shading a surface.

shadow-receiving style: A type of QuickDraw 3D object that determines whether or not objects in a model receive shadows when obscured by other objects in the model.

shape: See shape object.

shape object: A type of QuickDraw 3D object that affects how and where a renderer renders an object in a view. A shape object is an instance of the TQ3ShapeObject class.

shape part: See shape part object.

shape part object: A distinguishable part of a shape object. A shape part object is an instance of the TQ3ShapePartObject class. See also mesh part object.

shared object: A QuickDraw 3D object that may be referenced by many objects or the application at the same time. A shared object is an instance of the TQ3SharedObject class.

side elevation projection: A type of elevation projection in which the view plane is parallel to a side of the object being projected.

simple polygon: A closed plane figure defined by a list of vertices (that is, defined by a single contour). Defined by the TQ3PolygonData data type. See also general polygon.

smooth shading: See Gouraud shading, Phong shading.

space: (1) See coordinate system. (2) The two- or three-dimensional extent defined by a coordinate system.

spatial: Contained completely in three dimensions (as, for example, a box). See also planar.

specular coefficient: A measure of an object's level of specular reflection.

specular color: The color of the light of a specular reflection.

specular control: See specular reflection exponent.

specular exponent: See specular reflection exponent.

specular highlight: A bright area on an object's surface caused by specular reflection.

specular reflection: The type of reflection that is characteristic of light reflected from a shiny surface. Compare diffuse reflection.

specular reflection coefficient: See specular coefficient.

specular reflection exponent: A value that determines how quickly the specular reflection diminishes as the viewing direction moves away from the direction of reflection.

spherical coordinate system: A system of assigning spatial positions to objects in terms of their distances from the origin (r) along a ray that forms a given angle (q) with the x axis and another angle (f) with the z axis. Compare Cartesian coordinate system, polar coordinate system. spherical point A point in space described using spherical coordinates.

spot light: A light source that emits a circular cone of light in a specific direction from a specific location. See also fall-off value, hot angle, outer angle.

spot light data structure: A data structure that contains information about a spot light. Defined by the TQ3SpotLightData data type.

standard I/O library: A collection of functions that provide character I/O and file manipulation services for C programs. Compare UNIX storage object.

standard surface parameterization: A parametric function that maps the unit square to an object's surface. Compare custom surface parameterization, natural surface parameterization.

storage object: A QuickDraw 3D object that represents any piece of storage in a computer (for example, a file on disk, an area of memory, or some data on the Clipboard). A storage object is an instance of the TQ3StorageObject class.

storage pixmap: A two-dimensional array of values contained in a storage object, each of which represents the color of one pixel. Defined by the TQ3StoragePixmap data type. See also bitmap, pixmap.

stream file: A metafile that contains no internal references. In other words, a file object that does not contain a table of contents and in which any references to objects are simply copies of the objects themselves. See also normal file, stream file.

stream mode: The mode in which a stream file is opened. See also database mode, normal mode.

string: See string object.

string object: A QuickDraw 3D object that contains a sequence of characters. A string object is an instance of the TQ3StringObject class. See also C string object.

style: See style object.

style object: A type of QuickDraw 3D object that determines some of the basic characteristics of the renderer used to render the curves and surfaces in a scene. A style object is an instance of the TQ3StyleObject class.

subclass: See child class.

subdivision method: A method of subdividing smooth curves and surfaces. See constant subdivision, screen-space subdivision, world-space subdivision.

subdivision method specifier: An indicator of the number of parts into which a smooth curve or surface is to be subdivided.

subdivision style: A type of QuickDraw 3D object that determines how a renderer decomposes smooth curves and surfaces into polylines and polygonal meshes for display purposes.

subdivision style data structure: A data structure that contains information about the type of subdivision of curves and surfaces used by a renderer. Defined by the TQ3SubdivisionStyleData data type. submit To make an object (or group of objects) eligible for drawing, picking, writing, or bounding box or sphere calculation. Compare submitting loop.

submitting loop: A section of code in which all submitting takes place. Compare bounding loop, picking loop, rendering loop, writing loop.

superclass: See parent class.

surface-based shader: A shader that affects the surfaces of geometric objects based on their material properties, position, and orientation (and other factors). Compare view-based shader.

surface parameterization: A parametric function that picks out all points on a surface. See also custom surface parameterization, natural surface parameterization, standard surface parameterization.

surface normal: See normal vector.

surface shader: A shader that is applied when calculating the appearance of a surface. Compare texture shader.

surface tangent: A pair of vectors that indicate the directions of changing u and v parameters on a surface. Defined by the TQ3Tangent2D data type.

surrounding light: See ambient light.

synthetic: Not real, as for example the objects in a model. Compare prototypical.

synthetic camera: See camera object.

AppleVision 1710 Displays: Calibration Message (4/96)

Revised: 4/17/96
Security: Everyone

AppleVision 1710 Displays: Calibration Message (4/96)

=====

Article Created: 25 January 1996
Article Change History: 17 April 1996

TOPIC -----

How do I stop my AppleVision 1710AV or AppleVision 1710 from displaying the calibration message every two weeks?

DISCUSSION -----

You need to set the preferences in either the AppleVision Setup control panel, or the Sound & Displays control panel, dependent upon the System Software installed on your Macintosh computer. For more information on setting the preferences refer to your "AppleVision 1710AV Display User's Guide" or "AppleVision 1710 Display User's Guide."

Here are the steps to follow:

Step 1

Either open the AppleVision Setup control panel or press any of the buttons on the left side of the display.

Step 2

If your computer is equipped with the Sound & Displays control panel, double-click on the AppleVision 1710AV Display listed in the Display field.

Step 3

Click the Color button to open the control panel to the Accurate Color window.

Step 4

Click the Preferences button in the bottom left corner of the Accurate Color window to open the Preferences window.

Step 5

On the left side of the Preferences window is an Auto Recalibrate section, with a series of checkboxes, which determine when the display will recalibrate. Click the top four checkboxes to deselect them (an X no longer appears).

Your display will no longer display the "time to recalibrate" message every two weeks.

AICK Installer: QuickDraw GX and Acrobat Reader Fonts (1/96)

Revised: 1/25/96
Security: Everyone

AICK Installer: QuickDraw GX and Acrobat Reader Fonts (1/96)

=====

Article Created: 25 January 1996

TOPIC -----

After I installed the Apple Internet Connection Kit (AICK) and then restarted my computer, an error dialog appeared with this message, "The installed substitution fonts are not designed to work with QuickDraw GX." What is wrong?

DISCUSSION -----

This error occurs if AICK is installed when QuickDraw GX is already installed on your computer. There is a compatibility issue between QuickDraw GX, and the Adobe Acrobat Reader and accompanying fonts which AICK installs.

A solution is to install Acrobat Reader from a different source. The Acrobat Reader installer checks to see if QuickDraw GX is installed and then installs the appropriate fonts. Acrobat Reader is included on most new system CD-ROM discs, or it may be downloaded from an online source.

System 7.5.x: Restarting from the Extensions Manager (1/96)

Revised: 1/25/96
Security: Everyone

System 7.5.x: Restarting from the Extensions Manager (1/96)

=====

Article Created: 25 January 1996

TOPIC -----

This article describes how to restart your Macintosh computer from the Extensions Manager control panel.

DISCUSSION -----

If you interrupt the startup process by holding down the space bar to access the Extensions Manager, you can force your computer to restart immediately by holding down the command key while clicking the Extensions Manager's close box. The computer will restart and load the extensions that were selected when you clicked the close box.

This can be a useful procedure because some items like RAM Doubler, NOW Toolbox, and At Ease Startup require a full restart to load after being turned on in the Extensions Manager.

Newton 2.0 OS: Deleting a Backup from a PC Card (1/96)

Revised: 1/25/96
Security: Everyone

Newton 2.0 OS: Deleting a Backup from a PC Card (1/96)

=====

Article Created: 25 January 1996

TOPIC -----

I have a MessagePad 120 which has recently been upgraded to the Newton 2.0 OS. I created a backup on my card and now I want to delete it. When I select the PC card, all I see is "Erase," "Restore," and "Backup," but no "Delete Backup."

DISCUSSION -----

Previously using the Newton 1.x OS, the Erase option only erases the card. With the Newton 2.0 OS, if you tap Erase, you get additional options such as Entire Card, Backup Only, and Information Only.

You should select Backup Only. When you do, the rest of the information and packages are protected.

WiggleWorks: Splash Screen Displays Improperly (1/96)

Revised: 1/25/96
Security: Everyone

WiggleWorks: Splash Screen Displays Improperly (1/96)

Article Created: 25 January 1996

TOPIC -----

When I launch WiggleWorks on my Macintosh computer with System 7.5.2, the splash screen only displays a horizontal bar with the animation partially visible. I have tried disabling virtual memory, and selecting System 7.5.2 extensions only in the Extensions Manager, but it is still not working.

DISCUSSION -----

The problem you are encountering is caused by the Control Strip software that came with your Multiple Scan Display. This issue may occur on any Macintosh computer on which you launch WiggleWorks while the Control Strip is showing on the screen. You can see the full WiggleWorks splash screen by hiding the Control Strip before you launch the Wiggleworks application:

Step 1

Under the Apple Menu choose Control Panels.

Step 2

Double-click on the Control Strip control panel. Click the radio button next to Hide Control Strip. Close the Control Strip control panel.

Note: You can also click the Define hot key... button to set a key combination that hides and shows the Control Strip whenever you press those keys regardless of what application you are in.

Step 3

Launch WiggleWorks.

Newton Backup Utility: Fails Using System 7.1.2 (1/96)

Revised: 1/26/96
Security: Everyone

Newton Backup Utility: Fails Using System 7.1.2 (1/96)

=====

Article Created: 26 January 1996

TOPIC -----

I am having problems using the Newton Backup Utility on my Power Macintosh computer using System 7.1.2.

DISCUSSION -----

This is a known issue, but there are workarounds that can solve this problem.

Symptoms

=====

Extensions Off

If you attempt to launch Newton Backup Utility on a Macintosh computer that uses System 7.1.2 (early Power Macintosh computers) with extensions off the application starts, then stops without any messages. Newton Backup Utility does not launch successfully.

Extensions On

If you have extensions on a dialog appears explaining it cannot find AppleScriptLib. If you install AppleScriptLib from the 7.1.2 CD, a new dialog appears explaining it cannot find DragLib.

Workarounds

=====

Install System 7.5 or later

System 7.5 and later includes updated versions of the AppleScriptLib, ObjectSupportLib, and Macintosh Drag and Drop extensions.

Install Updated Extensions

Use the latest versions of these extensions:

- AppleScriptLib (v1.1 or better)
- ObjectSupportLib (v1.0.2 or better)
- Macintosh Drag and Drop (v1.1 or better)

The AppleScriptLib and ObjectSupportLib ships with System 7.5 CD and the Macintosh Drag and Drop extension can be downloaded from the Internet and online services.

Install the 68K Version

Use Custom install to install the 68K version of Newton Backup Utility on your Power Macintosh instead of the PowerPC native version. The downside of using the non-native software is that it runs a little slower.

IMPORTANT:

You must throw away any previous versions of Newton Backup Utility before installing the 68K version. If you do not remove previous versions, the Newton Backup Utility will still fail.

PCI-Based Power Macintosh Computers: Two Ethernet Ports (6/96)

Article Created: 26 January 1996
Article Reviewed/Updated: 27 June 1996

TOPIC -----

My PCI-based Power Macintosh computer has two Ethernet ports. Can I use both of them at the same time or does one port takes priority if I have two active connections?

DISCUSSION -----

The Power Macintosh 7200, 7500, 7600, 8500, and 9500 series computers have a built-in Ethernet port (comprised of one Ethernet controller chip) which accepts either a 10baseT cable or the Apple Ethernet (AAUI) adapter for thicknet or thinnet cables. The Ethernet port has two connectors but operates only one of them at a time. If devices are plugged into both connectors, the system defaults to the 10baseT connection.

Note: This information is taken from the Power Macintosh 7500/8500 Developer Notes.

Security: Everyone

PCI-Based Power Macintosh: -50 Error When Ejecting CD (5/96)

Article Created: 26 January 1996
Article Reviewed/Updated: 28 May 1996

TOPIC -----

I have a recent Power Macintosh computer, and I have noticed that my system software CD-ROM disc mounts even if I do not have CD-ROM software loaded. I can do this even if I use the system software CD from an older Power Macintosh computer. However, I sometimes get a -50 error when I attempt to eject the CD-ROM disc. What could be causing this to happen?

DISCUSSION -----

During the startup process, the computer checks all available SCSI volumes, including the CD-ROM drive. If the CD-ROM disc contains the ".AppleCD" driver, it will be loaded and used by the computer to access the CD-ROM drive in lieu of the CD-ROM software that would have loaded if the extensions were not off. This works fine for most purposes.

However, some newer CD-ROM drives need slightly different information than those that shipped with earlier Power Macintosh computers to eject a CD-ROM disc. For example, your computer may have a quadruple-speed (4x) CD-ROM drive, but the system software CD-ROM disc you inserted may load a CD-ROM driver for a double-speed (2x) CD-ROM drive.

This causes the -50 error, which indicates that the internal parameters being used to eject the CD are incorrect. You should be able to eject the CD-ROM disc if you restart the computer again, and press the eject button on the CD-ROM drive before the computer displays "Welcome to Macintosh".

Pwr Mac 5200/5300/6200/6300: Sound Issue w/Spin Doctor1.2 (1/96)

Revised: 1/26/96
Security: Everyone

Pwr Mac 5200/5300/6200/6300: Sound Issue w/Spin Doctor1.2 (1/96)

=====

Article Created: 26 January 1996

TOPIC -----

I have a PowerBook computer with the PowerBook Mobility Bundle, which includes the game, Spin Doctor v1.2. I tried to use that game on my Macintosh Performa 5215, but I notice that when I turn the sound all the way down using the "-" key, I can no longer use the sound. I should be able to turn the sound back up using the "+" key, but this does not work. I have tried quitting the application and relaunching the game, but I still do not hear sound. How do I correct this problem?

DISCUSSION -----

Callisto Corporation (the developer of Spin Doctor) states that this is a known issue with the native version of Spin Doctor (v1.2) on the Power Macintosh and Performa 5200, 5300, 6200, 6300 series computers*. However, this problem does NOT occur with the Spin Doctor Challenger game that is included with the Macintosh Performa 630 and 6100 series computers. To correct this problem, follow these steps:

Step 1

Delete the Spin Doctor Settings preference file. You can find it at the following path:

System Folder -> Preferences -> Spin Doctor Settings

Step 2

Select the preferred sound level from the Sound control panel before relaunching Spin Doctor.

Spin Doctor will now match the settings on the Sound control panel.

*The following computers will be affected by this issue:

- The Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.
- The Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.
- The Macintosh Performa 5300CD and Power Macintosh 5300/100 LC
- The Macintosh Performa 6300CD

Newton 2.0 OS: Creating Custom Worksites For Dialing (1/96)

Revised: 1/26/96
Security: Everyone

Newton 2.0 OS: Creating Custom Worksites For Dialing (1/96)

=====

Article Created: 26 January 1996

TOPIC -----

I live in a city that has multiple calling zones. Sometimes I have to enter the area code, but not the "1" in front of the phone number. Is there an easier way to do this than using the assist button?

DISCUSSION -----

Yes, you can create custom worksites for special calling requirements. The worksite can be selected in a call slip, and is in effect until a different worksite is chosen. This is easier than editing the information using the assist button in a call slip.

Creating a Custom Worksite
=====

Step 1

Open the Extras Drawer

Step 2

Choose the Setup folder. Do this by tapping on the folder tab.

Step 3

Tap on the Owner Info icon.

Step 4

Tap New. A new list appears.

Step 5

Tap Worksite. An Untitled Worksite slip appears.

Step 6

Enter a name in the Worksite field.

TIP:

Use a name that will help you remember how the Worksite functions.

Step 7

Enter the number that you want to precede the phone number, into the Dialing Prefix field.

For example, if you want the area code 555 to precede the phone number you are dialing, enter 555 into the Dialing Prefix field.

You can create worksites for each special calling requirement you have.

Newton 2.0 OS : Maximum Number of Folders (1/96)

=====

Article Created: 26 January 1996

TOPIC -----

How many folders can I set up on my Apple MessagePad 120 with the Newton 2.0 OS?

DISCUSSION -----

Using the Newton 2.0 OS, each application (such as Notes, Names, and Calls) can have 12 folders that show up only in that application.

Additional folders can be added, but they will be global folders and will show up everywhere.

Scholastic SuperPrint: Clip Art Files Manual Error (1/96)

Revised: 1/26/96
Security: Everyone

Scholastic SuperPrint: Clip Art Files Manual Error (1/96)

=====

Article Created: 26 January 1996

TOPIC -----

The manual for Scholastic SuperPrint that came with my Apple Early Language Connections bundle states it comes with 33 clip art galleries (page 29), 19 frames (page 32), and 19 scenes (page 33).

When I compare what is actually on my hard drive to what the documentation shows I see the following:

- 18 clip art galleries not 33.
- 10 frames not 19.
- 10 scenes not 19.

DISCUSSION -----

The discrepancy between the actual number of files installed and the number listed in the manual is a documentation problem. SuperPrint includes 18 clip art galleries, 10 frames, and 10 scenes. A separate product called SuperPrint Graphics Pack contains the additional graphics.

The Early Language Connections bundle contains both SuperPrint and the SuperPrint Graphics Pack. When both these products are installed there are 33 clip art galleries, 19 frames, and 19 scenes.

Power Macintosh: Developer's Can Test for Power Clean Code 1/96

Revised: 1/29/96
Security: Everyone

Power Macintosh: Developer's Can Test for Power Clean Code 1/96

=====

Article Created: 29 January 1996

TOPIC -----

As I buy more and more Power Macintosh computers with PowerPC 603, 603e, and 604 processors for my business, I am seeing more incidents of incompatibilities and poor performance. According to the Developer Technotes (pasted below), this could be a result of applications being compiled with compilers that do not generate Power Clean code.

Excerpt from Developer Technical Notes:

"The first generation Power Macintosh computers used the PowerPC 601 microprocessor, a microprocessor that bridged the new PowerPC architecture with the POWER architecture from which it descended. The PowerPC 601 implemented most of the old POWER instruction set as well as the newer PowerPC instruction set. Later versions of the microprocessor, namely the PowerPC 603 and 604, only implement the PowerPC instruction set, hence the term "power clean." Because of the differences in instruction set implementation, a possibility exists for incompatibility and poor performance, particularly in the area of compilers. Newer compilers, designed for the PowerPC instruction set, do not generate the old POWER instructions. However, compilers designed for the POWER instruction set are also being used to compile programs for the PowerPC instruction set. Most of those compilers have the option to suppress the generation of offending instructions. For example, the IBM xLc C compiler and the xLCC++ compiler have the option -garch=ppc. Developers using these compilers should verify that the options are in effect for all parts of their code. To be on the safe side, you should contact your compiler vendor to make sure that the compiler you are using does not generate POWER instructions."

Is there a utility available from Developer Technical Support that could help identify whether or not an application, extension, or control panel, uses old PowerPC 601 instructions not supported on the PowerPC 603, 603e, and 604 processors?

DISCUSSION -----

Apple is not aware of any end-user application or utility that can tell if a computer is running PowerPC 601 specific code. However, the developer of your application can check their code to be sure it is "Power Clean" using a Macintosh Programmer's Workshop (MPW) tool called DumpPEF. Developers should be using MPW version 2.0 or later. Here is more information from Developer Technical Support regarding this topic:

"The latest pre-release MPW DumpPEF tool (version 2.0b1 from E.T.O. #15) has an option, -w601, to scan for PowerPC 601 specific instructions. It is one way to test if your code is affected. Be aware, however, that DumpPEF cannot always distinguish between code and data and may flag POWER opcodes that are really data. You should check all warnings from DumpPEF to be sure they are not spurious. Even if the tool finds valid POWER opcodes, there is no guarantee the instructions are part of an executable code path. You should, of course, test your application on 603/604 hardware as soon as it is available."

This means the MPW tool DumpPEF version 2.0 or later will identify 601 specific instructions. If DumpPEF finds no 601 specific instructions, your code is considered Power Clean. Even if DumpPEF finds 601 instructions, your code may still be clean; you have to examine further the 601 code in question to ensure that DumpPEF is not reporting a 'false positive' due to reading data as code.

Apple LaserWriter Printers: MIB Support (1/96)

Revised: 1/29/96
Security: Everyone

Apple LaserWriter Printers: MIB Support (1/96)

=====

Article Created: 29 January 1996

TOPIC -----

I am using Hewlett Packard (HP) K200 UNIX servers, and I would like the Simple Network Management Protocol (SNMP) Management Information Block (MIB) information for the following Apple LaserWriters:

LaserWriter 16/600 PS
LaserWriter Select 360
LaserWriter IINT
LaserWriter IINTX
LaserWriter Pro 630

DISCUSSION -----

The printers you listed have no SNMP MIB agents. As a matter of fact, the only printer in your list that supports TCP/IP is the LaserWriter 16/600 PS printer.

The only printer Apple has shipped that is SNMP compliant is the LaserWriter Pro 810 with its Virtual Printer Technology (VPT). VPT is SNMP compliant with MIB II, Character MIB, and RS-232 MIB.

Revised: 1/29/96
Security: Everyone

Power Macintosh 5200: Tinted Video (1/96)

Article Created: 29 January 1996

TOPIC -----

I have a Power Macintosh 5200 computer, and lately I've noticed that the monitor appears to flicker intermittently. Also, the monitor appears to be discolored. What could be causing this?

DISCUSSION -----

Verify that environmental interference is not the cause of the flickering and discoloration. To do this, try the following suggestions; be sure to look for improvements and changes after following a suggestion:

- Change the location and/or rotate the computer.
- Remove metal objects from the area.
- Look for other environmental influences (power lines, generators, refrigerators, air conditioners).
- Check fluorescent lighting fixtures and transformers, which are also common sources of interference.

If the symptoms you are experiencing do not appear to have an environmental cause, contact an Apple-authorized service provider for additional assistance.

The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

How Support Professional Differs From Free WWW Access (11/96)

=====

Article Created: 30 January 1996
Article Reviewed/Updated: 27 November 1996

TOPIC -----

Why should I subscribe to Apple's Support Professional program when I can find some of the same information on Apple's World Wide Web (WWW) page at www.info.apple.com? How do the two services compare to each other?

DISCUSSION -----

Apple's Support Professional Product
=====

Apple's Support Professional Solution Series is a new approach to the delivery of vital Macintosh support information. Combining CDs, Support Notice! email service on important support issues, product and technology teleconferences, and fax transmissions, Support Professional is a comprehensive solution that helps you assist Macintosh users more efficiently and cost effectively.

With Support Professional, support administrators can reduce training costs, improve response time, and manage support resources more efficiently. It frees you to spend more time analyzing long-term support needs and strategies instead of dealing with day-to-day crises. It also provides information on new products and technologies and their impact on your support operations.

Both the Support Professional Solution 500 Series and 700 Series offer a wide variety of essential Apple technologies.

The quarterly Support Briefing System brings you a CD-based presentation on the latest Apple technologies. Each CD mailing is followed by teleconferences where your questions are answered by Apple engineers, third-party engineers, and other subject-matter experts.

The Support Information System (SIS), based on AppleSearch technology, gives you access to Apple's extensive support resources for fast, thorough problem

resolution. You can set up an information server for your organization that supports natural-language or Boolean searches of Apple's Support Library and other Wide Area Information Server (WAIS) libraries. You can also store your organization's own support information. The SIS includes bimonthly CDs containing a wealth of information on Apple products, including product specifications, a current Apple software archive for disaster recovery and testing purposes, configuration and compatibility information, Apple's Technical Information Library (Apple's official technical support database), software updates, and Apple product manuals. Also included are archives of all previous program and support information.

The Skill Module System features modular, self-paced training for your help-desk staff, technology coordinators, and other support personnel.

If you choose the Support Professional Solution 700 Series, you'll also get direct, unlimited access to senior Apple support engineers through the Support Professional Escalation Line. Your designated contact people will have toll-free access—with a 60-second target response time—from 7:00 a.m. to 7:00 p.m. Central Time, Monday through Friday. (Upgrade options are available for extended hours.)

Ordering Information

If you would like to receive ordering information and/or a free Support Professional Preview Kit on the Support Professional program, you may call 1-800-745-2775 between the hours of 7 a.m. and 10 p.m. Central Time.

The Internet - Apple Support & Information Web

=====

The Apple Support & Information Web provides a wide range of services. The URL (universal resource locator) is: <http://www.info.apple.com> (IP address is: 204.96.16.2). The focus is support information, but it's also a part of the greater Apple web site.

1) Apple Technical Information Library

The public subset of the Apple Tech Info Library, which is the Apple Assistance Center's official technical support database. Over 13,000 articles on Apple products, past and present can be searched by simply typing a word or several words into a text field and clicking a search button. The information is indexed by a Wide Area Information Server (WAIS) which is updated daily with new and revised information.

2) Apple Software Updates

All "freely" distributed Apple software updates, including printing software, system updates, network software updates and utilities are published to several ftp sites. Compared to commercial online services, an ftp site handles three to four times the file transfers in a given period.

This area points to the Apple Software Updates library on <ftp.info.apple.com>

(formerly ftp.austin.apple.com). This library contains all free software updates. This is the same software that is posted to American Online, CompuServe, and the Support Professional CD's and ftp site.

3) Apple Product and Support Information

A variety of information is posted, including:

- How to contact Apple Support by telephone, fax and online services.
- Apple fee-based support programs and services information.
- Top Ask Apple FAQ's, covering top questions and answers on Apple products.*
- Apple Press Releases and selected new product information.
- Apple product datasheets in both text and Adobe Acrobat format.
- All issues of the "Information Alley," Apple Support's daily electronic magazine, focusing on answering the questions asked of the Apple Assistance Center.

* Also available in the Tech Info Library by using the keyword, kfaq.

Comparison Chart

=====

Apple MessagePad 120: Determining RAM Size (2/96)

=====

Article Created: 30 January 1996
Article Reviewed/Updated: 6 February 1996

TOPIC -----

Is there a way to determine how much RAM is in my Apple MessagePad 120?

DISCUSSION -----

There is no way to determine the RAM configuration without powering on the Apple MessagePad 120.

You can check the RAM configuration by tapping the information icon in the Extras drawer. The total of Used, Free, and System RAM installed will equal 1MB or 2MB.

Step 1

Turn on your Apple MessagePad 120

Step 2

Tap Extras

Step 3

Tap the information icon ('i' in the lower left corner)

Step 4

Tap Memory Info

Step 5

Add the System RAM Installed, Used and Free numbers. This is the total flash RAM installed.

Example:

```
System RAM:  512k
           Used:  952k
           Free:  409k
           Total: 1873k (2MB)
```

Article Change History:

06 Feb 1996 - Corrected Type of RAM.

Infrared Remote Control: Functions & Troubleshooting (1/96)

Revised: 1/30/96
Security: Everyone

Infrared Remote Control: Functions & Troubleshooting (1/96)

=====

Article Created: 30 January 1996

TOPIC -----

This article provides information on the infrared remote control functions, and also provides troubleshooting tips.

DISCUSSION -----

An infrared remote control is included with all Macintosh computers that include a television tuner or tuner module. It is also included with the Apple TV/Video System. There are two remote control models, both offer identical functions:

- A thin, credit-card type remote with a raised-bubble control pad
- A larger, standard-type remote control similar to those included with many televisions and VCR players.

CONTROLS

=====

- Power: Turns the computer on and off. When turning the computer off using the remote control, you must quit all applications currently running before the shut down is completed. Quitting applications is performed automatically. However, you must respond to any dialogs that may appear during the shut down process.

- Muting: When using the Apple Video Player or AppleCD Audio Player, turns the sound off and on. The word "Muting" appears in Apple Video Player's video window, except when playing MPEG movies. The Sound control panel also indicates that you have muted the sound.

- Volume +, Volume -: Two buttons. Increases or decreases the volume for Apple Video Player or AppleCD Audio Player.

- Channel +, Channel -: Two buttons. Changes the programmed television channels in Apple Video Player in ascending or descending numerical order.

- Display: Toggles the video window in the Apple Video Player between the current size and the largest size.
- TV/Video/Mac: Toggles between the Apple Video Player window and other Macintosh applications currently running. If Apple Video Player is not running, it is launched.
- Stop/Eject: Press once to stop the currently playing audio CD. Press again to eject the audio CD. Also ejects a Video CD when in the Apple Video Player.
- REV: To go to the previous track on an audio CD.
- FWD: To go to the next track on an audio CD.
- Play/Pause: Play or pause an audio CD.

What to Do if the Remote Does Not Work

=====

- Make sure you have answered all dialogs or error messages that are on your computer screen.
- Check the remote control with another Macintosh computer that uses a remote control. Try powering on/off the computer. Some Sony television sets also work since they use the same type of remote control signal. If your remote control can power on/off another device the problem is unlikely to be the remote control unit.
- Make sure you have the Video Startup extension installed in your Extensions folder. If you do not have this extension in your Extension folder, only the Power button on the remote control works.
- Make sure you are using the remote control in close proximity to the black infrared receiver window in your Macintosh computer. Also make sure nothing is obstructing the infrared receiver window.
- The thin, credit-card type remote is shipped with a clear plastic tab that protects the battery during shipping. Remove this tab if present.
- The checkbox labeled "Disable Remote Control" may be selected in Apple Video Player. Choose Preferences from the Setup menu and deselect this box. Having this option selected disables ALL remote control functions, including Power, regardless of whether Apple Video Player is currently running. After shut down, however, the remote will still be able to power on the computer. The other functions remain disabled after starting up until "Disable Remote Control" is deselected in Apple Video Player, or the Video Player Prefs file is thrown away, and Apple Video Player is restarted.
- The remote control may have a dead battery.

Thin Remote Control

Insert a pen tip into the small round hole on the back of the remote control, then move it to the right to allow the battery compartment to slide freely outward from the bottom of the remote.

Replace the battery with a 3-volt lithium cell (type CR2025). These batteries are available wherever camera, watch, and calculator batteries are sold.

Larger Remote Control

Slide the battery cover off with your thumb. Replace the batteries with fresh AA batteries.

Remote Control Works in Some Applications

=====

- Try using it to control AppleCD Audio Player functions. If it works properly with AppleCD Audio Player, it may be that only the application Apple Video Player is not working properly.
- Trash the Apple Video Player Prefs file from the Preferences folder, inside your System Folder, and restart the computer.
 - If Apple Video Player still does not work after throwing away the preferences, reinstall Apple Video Player and the Video Startup extension.

NOTE:

Make sure to throw away the old versions of Apple Video Player and the Video Startup extension before installing new versions.

Drive Setup 1.0.x: How to Partition Your Hard Drive (5/96)

Revised: 5/6/96
Security: Everyone

Drive Setup 1.0.x: How to Partition Your Hard Drive (5/96)

Article Created: 30 January 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

Drive Setup Guide has a step-by-step walk-through of how to partition my hard drive, but I am not able to finish the walk-through because the drive being partitioned is the startup volume. I tried starting from the System CD-ROM disc that came with my computer to free the hard drive for partitioning. However, the Apple Guide extension is not part of the startup software on the CD-ROM disc and Drive Setup Guide is not available.

How do I partition the hard drive with Drive Setup?

DISCUSSION -----

Follow these steps to partition your hard drive:

WARNING: Partitioning your hard drive will erase all the information on the disk. Make sure you have all your information backed up so you can restore your hard drive after it has been partitioned.

Step 1

Startup from the System CD-ROM disc or from another startup disk other than the one being partitioned.

Step 2

Double-click on Drive Setup, located on either the startup CD-ROM disc or floppy disk.

Step 3

Select the name of the disk to be partitioned from the device list provided in Drive Setup's first window.

Step 4

Click the "Initialize..." button.

WARNING: This process will erase everything on the drive being partitioned. Be sure this is the drive you want to partition.

Step 5

Click the "Custom Setup..." button.

Step 6

Click the pop-up menu next to the words "Partitioning Scheme" and select "Current Volumes"--the topmost item in this menu. From the list of items provided, select the number of HFS (Hierarchical File System) partitions that you wish to create. Eight partitions is the maximum.

Step 7

A graphical representation of the partitioning option you selected will appear in the window. If you wish to customize the size of an individual partition, move the mouse cursor to the small rectangle on the border between two partitions. The pointer will then change to two arrows indicating that you are now in the correct position to modify the partition size. Click and hold the mouse button to increase or decrease the partition size by sliding the rectangle up and down, respectively. The exact partition size will be indicated in the "Volume Info" section of the window.

Step 8

Click the "OK" button to accept the partitioning scheme you have configured. You will then be returned to the previous window, where your partitioning scheme will be summarized.

Step 9

Click the "Initialize" button. The drive will be partitioned accordingly, erasing all data stored on it in the process. Partition names will by default be titled, "Untitled x" where "x" represents the partition number. You can rename the partitions after initialization is completed and you have quit Drive Setup. If, thereafter, you wish to startup the computer from one of the partitions, you will have to install system software on that partition.

PowerPC Platform: An Overview (3/97)

Revised: 3/24/97
Security: Everyone

PowerPC Platform: An Overview (3/97)

Article Created: 30 January 1996
Article Reviewed/Updated: 24 March 1997

TOPIC -----

This article provides an overview of the PowerPC Platform (PPCP) (formerly known as CHRP).

DISCUSSION -----

This information is taken from "PowerPC Microprocessor Common Hardware Reference Platform: A System Architecture", which is available from the PPCP Web Site:

<http://chrp.apple.com/>

What is PPCP?

=====

The PowerPC Platform (PPCP) architecture specification provides a comprehensive computer system hardware-to-software interface definition, combined with minimum system requirements, that enables the development of and software porting to a range of compatible industry-standard computer systems from portables through servers. These systems are based on the PowerPC microprocessor, as defined in The PowerPC Architecture. The definition supports the development of both uniprocessor and multiprocessor system implementations.

A key attribute and benefit of the architecture is the ability of hardware platform developers to have degrees of freedom of implementation below the level of architected interfaces and creating an opportunity for adding unique value. This flexibility is achieved through architecture facilities including:

- device drivers
- Open Firmware (OF)
- Run-Time Abstraction Services (RTAS)
- hardware abstraction layers.

Though the PowerPC microprocessor is the most widely used RISC processor,

substantial legacy software exists and a mechanism for running the bulk of this legacy software is a requirement. The system address map has been defined with a specific objective of assisting efficient x86 emulation. Additionally the PowerPC microprocessors support Bi-Endian operation which is a key attribute important to running the supported operating systems and applications. Bi-Endian capability is not available in the current IBM PC compatible x86-based system architecture.

The architecture combines leading-edge IBM PC and Apple Macintosh technologies to create a superior personal computing platform. By design, it supports a wide range of computing needs including personal productivity, engineering design, data management, information analysis, education, desktop publishing, multimedia, entertainment, and database, file, and application servers. The architecture effectively leverages industry-standard I/O through the PCI bus while accommodating legacy I/O from both the IBM PC compatible and the Apple Macintosh domains.

This approach provides several key benefits for system manufacturers and end customers:

- systems can be designed and manufactured to enable the customer a choice of operating system support
- smooth application, operating system and customer system transitions are enabled by accommodation for legacy software, I/O devices, and peripherals.

This architecture helps protect the customer's investment while moving to more advanced portable, desktop and server computing platforms. Systems based on this architecture are expected to offer price/performance advantages and to address the expected growth in computing performance and functionality.

PowerPC Platform: Macintosh Technology (3/97)

Article Created: 30 January 1996
Article Reviewed/Updated: 24 March 1997

TOPIC -----

This article provides an overview of the Macintosh technology involved in the PowerPC Platform (PPCP) (formerly known as CHRP).

DISCUSSION -----

This information is taken from "Macintosh Technology in the Common Hardware Reference Platform", which is available from the PPCP Web Site:

<http://chrp.apple.com/>

Apple Computer and the PowerPC Platform

The PowerPC Reference Platform (PReP), Apple RISC architecture, and IBM RISC server systems were used in the development of the PowerPC Platform (PPCP) architecture. The objective was to reduce the porting effort of operating systems and applications coming from each of these environments. The information below describes the relationship of the Apple RISC architecture to the PPCP architecture and of the PowerPC Reference Platform to this architecture. The PowerPC Reference Platform used IBM RISC client and server information.

Many components of the second-generation Power Macintosh architecture are included for compatibility with the desktop products based on that architecture. Features of the second generation Power Macintosh are listed below:

- Based on the PowerPC microprocessor family for main system processing. The instruction set of the Motorola 68LC040 is supported through a built-in emulation system.
- Use of the PCI bus to support all I/O and system expansion. Other buses (such as NuBus, SCSI and IDE) are supported by means of bridge ASICs connected to the PCI bus.

- Use of Open Firmware for system startup and to allow use of expansion cards from other architectures. While the Mac OS continues to be the principal operating system for Power Macintosh computers, Open Firmware lets other operating systems that are ported to the PowerPC instruction set take control of the computer.
- Function of processor bus coherency. Memory systems connected directly to the PowerPC bus, including main RAM and all levels of cache, belong to a single coherency domain.
- Support for both Big-Endian and Little-Endian addressing modes. Besides the support for both modes built into the PowerPC processor, storage subsystems such as frame buffers are accessible to software through both big-endian and little-endian apertures.
- Support for Macintosh-style I/O such as ADB, SCC and LocalTalk.
- Support for PowerPC-native interrupts and native device drivers.

Apple is currently designing computers that will comply with the PowerPC Platform specification. The following table lists the general characteristics of first- and second-generation Power Macintosh computers and the currently-projected characteristics of Power Macintosh computers that comply with the PowerPC Platform specification.

Begin_Table

PPCP-Macintosh feature comparison

Feature =====	First-Generation Power Macintosh =====	Second-Generation Power Macintosh =====	PPCP Spec. Power Macintosh =====
Processor Type	PowerPC 601	PowerPC 601, 603 or 604	All PowerPC Models
Processor Upgrade	None	By replacing processor subsystem card	By replacing processor subsystem card
External Cache	Up to 1MB	Up to 4MB	Up to 4MB
RAM expansion	32-bit SIMM	64-bit DIMM	64-bit DIMM
Maximum RAM	72-264 MB	1 GB-1.5 GB	To be determined
NVRAM	Macintosh PRAM	8 KB	8 KB

Support for 21-inch monitors	None, 16 bpp, or 24 bpp	16 bpp or 24 bpp	16 bpp or 24 bpp
Sound	Macintosh 16-bit, 44.1 MHz, stereo input and output	Macintosh 16-bit, 44.1 MHz, stereo input and output	Macintosh and SoundBlaster- compatible stereo input and output
Internal hard disk	160 MB to 1 GB	250 MB to 2 GB	To be determined
Additional internal drives	One 5.25-inch, one or two 3.5-inch	One 5.25-inch, one or two 3.5-inch	To be determined
SCSI buses	1 internal, 1 external	1 fast internal, 1 external	To be determined
IDE bus	No	No	Yes
Floppy disk format	MFM or GCR	MFM or GCR	MFM only
Ethernet	AAUI	AAUI or 10BaseT	10BaseT
GeoPort serial ports	2	2	1-2
x86- compatible RS-232 serial ports	None	None	0-2
IEEE P1284 parallel ports	None	None	In some models
NuBus slots	1-3	None	None
PCI slots	None	3-6	3-6
ISA slot	None	None	None

PowerBook 2300c: Modem Installation & Compatibility (6/96)

Revised: 6/10/96
Security: Everyone

PowerBook 2300c: Modem Installation & Compatibility (6/96)

=====

Article Created: 31 January 1996
Article Reviewed/Updated: 10 June 1996

TOPIC -----

My authorized Apple service technician installed an Express Modem. Now my PowerBook Duo computer starts up with the "death chimes" error chord. What is wrong? Which modem can I use in a PowerBook (Duo) 2300c or a PowerBook 200 series computer that has been upgraded to a 2300 series logic board (M3171LL/A)?

DISCUSSION -----

Apple Express Modem
=====

The Apple Express Modem for the PowerBook Duo series computers will work in the Macintosh PowerBook 2300c or a 200 series computer that has been upgraded with a PowerPC logic board as long as you install the current version of the Apple Telecom Software (Express Modem).

The current version of the Apple Telecom Software is 2.3.2. It is available online in all of the Apple Software updates areas. Versions earlier than 2.3.2 of the Telecom/Express Modem software may cause error chords at startup after installation or may significantly slow down modem performance.

If you have installed a version of the Apple Telecom Software earlier than version 2.3.2, you will need to remove it.

Step 1

Authorized Apple Service technicians ** need to reset the Power Manager by removing the internal back up battery for approximately 15 minutes.

** Caution ** If you are NOT an authorized Apple Service technician, please note that removing the internal backup battery is not a simple procedure and is not

recommended. No instructions for this procedure will be provided to end users by Apple. If anything is damaged in your attempt to remove the battery, the damaged parts will not be covered under warranty. **

Step 2

Startup the computer with extensions off by holding down the SHIFT key during startup.

Step 3

Remove the old Express Modem software from the Hard Drive and System folder.

Step 4

Install Apple Telecom Software 2.3.2.

Global Village Modem

=====

Global Village Mercury modem for the Duo series will need a software update. You will need to contact Global Village for more information.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Global Village, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

These articles can help you locate the software update mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates.
- Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Article Change History:

10 Jun 1996 - Added information about upgraded 200 series computers.
20 Feb 1996 - Added "death chime" to make searching easier.
15 Feb 1996 - Changed title to be more descriptive.

AppleVision 1710 Display: Description (1/96)

=====

Article Created: 31 January 1996

TOPIC -----

This article contains a description of the AppleVision 1710 Display.

DISCUSSION -----

Description
=====

The AppleVision 1710 is a superior quality color display that's perfect for business tasks such as desktop publishing, working with spreadsheets, and creating presentations. It combines multiple scan capabilities with the next generation Trinitron tube, and offers a host of advanced Apple DigitalColor technology-- features setting a new standard in clarity, color accuracy, and viewing flexibility. And it features plug-and-play compatibility with DOS and Windows software- based computers as well as Macintosh and Power Macintosh systems. Everyone wants accurate color on their monitor and the Apple Digital Color technology features of the AppleVision 1710 let it offer truly unprecedented image quality. It includes internal self-calibration technology-- eliminating the need to spend time and money to maintain accurate calibration. In addition, the AppleVision 1710 provides automatic screen-to-print matching using Apple's unparalleled ColorSync 2.0 technology. It can also be adjusted to compensate for many of the effects of ambient lighting and CRT phosphor aging. And its intuitive Macintosh software provides control over all screen functions, including geometry, brightness, contrast, and variable color temperature. Sony Trinitron screens have long been known for their outstanding image quality, and the screen of the AppleVision 1710 is no exception. In fact, it represents the next generation of Trinitron technology, featuring not only an incredibly vivid, sharp picture, but also a design that reflects the light in the room away from your eyes. And its multiple scan technology gives you the flexibility you need, letting you view more than two full pages of information at a time at an impressive 1,280 by 1,024 pixels. Yet even with all of these features, the AppleVision 1710 remains affordable making it the perfect choice for anyone whose work requires a vivid, accurate, and flexible color viewing solution.

Features

=====

Outstanding Image Quality

- Features next-generation Trinitron technology for clear, sharp pictures and vivid color
- Provides outstanding color matching and extremely accurate on-screen color representation
- Adjusts luminance and color temperature to provide outstanding image quality in any ambient light
- Keeps colors accurate and balanced over time, even as the CRT ages

Advanced Functionality

- Uses multiple-scan electronics that enable a high level of user flexibility
- Offers a range of resolution modes—up to 1,280 by 1,024 pixels
- Features a built-in intelligent feedback loop to ensure that your monitor remains calibrated
- Provides advanced but easy-to-use software control over all screen functions

Compatibility

- Works with MS-DOS and Windows software-based systems, as well as with the full line of Macintosh and Power Macintosh computers
- Supports plug-and-play connection to both Apple computers and PCs running MS-DOS and Windows software

Ordering Information

AppleVision 1710 Order No. M3322LL/A

- AppleVision 1710
- AppleVision software
- PC adapter
- Integrated, attached video and Apple Desktop Bus cable
- Power jumper cable
- Ambient light wand
- User's guide
- Limited warranty

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

AppleVision 1710 Display: Technical Specifications (1/96)

=====

Article Created: 31 January 1996

TOPIC -----

This article contains the technical specifications of the AppleVision 1710 Display.

DISCUSSION -----

Picture Tube

- 17-in. (diagonal) Trinitron CRT
- 16.1 in. (diagonal viewable image size)
- 0.26-mm stripe pitch (0.25-mm grille pitch)

Resolution/Screen Refresh Rate

Macintosh computers:

- 640 by 480 pixels at 67 Hz
- 832 by 624 pixels at 75 Hz
- 1,024 by 768 pixels at 75 Hz
- 1,152 by 870 pixels at 75 Hz
- 1,280 by 1,024 pixels at 75 Hz

PC-compatible systems:

- 640 by 480 pixels at 60 Hz to 75 Hz
- 800 by 600 pixels at 60 Hz to 75 Hz
- 1,024 by 768 pixels at 60 Hz to 75 Hz
- 1,280 by 1,024 pixels at 60 Hz to 75 Hz

Scanning Rates

- 30 kHz to 80 kHz (horizontal)
- 40 Hz to 120 Hz (vertical)

Apple DigitalColor Technology Features

- Self-calibration against factory measurements
- Adjustment for ambient lighting
- Adjustment for CRT phosphor aging

Screen Treatment

- Antistatic, antiglare coating

Digital Controls

- Brightness
- Contrast
- Horizontal size and centering
- Vertical size and centering
- Convergence
- Rotation
- Pincushion
- Completely variable white-point selection: 4,100 deg. K to 9,300 deg. K
- Power switch

Connector

- 15-pin DSub connector for Macintosh systems
- 15-pin DSub mini-adapter for PCs

Degauss Circuitry

- Automatic at power up

Electrical Requirements

- Line voltage: 90 to 264 V AC
- Frequency: 47 to 63 Hz, single phase
- Power: 150 W (maximum) when operating; less than 11 W in standby mode; 0 W in suspend mode and when CPU is in energy-saver mode

Environmental Requirements

- Temperature: 50 to 104 deg F (10 to 40 deg C)
- Humidity: 10% to 80%, noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and Weight

- Height: 16.8 in. (42.7 cm)
- Width: 16.2 in. (41.1 cm)
- Depth: 17.6 in. (45.2 cm)
- Weight: 49 lb. (23 kg)

Agency Approvals

- FCC Part 15 Class B
- CISPR 22 Class A (EN5008211)—complies with European EMC directive

- DOC Class B
- MPR II
- VCCI Class 2
- CE Mark
- EPA Energy Star compliant
- IEC 950
- UL1950
- CSA 950
- EN60950

System Requirements

- Power Macintosh, Macintosh Quadra, Macintosh Centris, Macintosh II (with video card), and PowerBook computers*
- System software version 7.1 or later

* Not all models and configurations are capable of driving the monitor to the highest resolution it supports.

Ordering Information

AppleVision 1710 Order No. M3322LL/A

Apple Video Player: Errors When Freezing or Copying Image 1/96

Revised: 1/31/96
Security: Everyone

Apple Video Player: Errors When Freezing or Copying Image 1/96

=====

Article Created: 31 January 1996

TOPIC -----

When I try to capture a large (640x480) image in the Apple Video Player on my computer by pressing command-C, I get an error message that says "An error occurred while trying to copy the video display to the clipboard."

I have also received the message, "An error occurred while trying to freeze the video display" when I click the Freeze button.

How can I fix this?

DISCUSSION -----

Apple Video Player is running out of memory as it copies your image to the clipboard. You can increase the preferred memory size for this application through the Get Info window. Follow these steps to do this:

Step 1

Locate the Apple Video Player application on your hard drive. Make sure it is not running as you will not be able to change the memory partition if it is.

Step 2

Click Apple Video Player once to highlight it. Under File choose Get Info.

Step 3

In the bottom of the Get Info window, adjust the Preferred size by double-clicking in the Preferred size box and typing in a higher number.

The size that you set depends on the complexity and size of the image you are trying to copy to the clipboard. Try increasing in 100K increments.

PCI Power Macintosh: Can't Use Modem With Extensions Off 4/96

Article Created: 31 January 1996
Article Reviewed/Updated: 10 April 1996

TOPIC -----

If I startup my Power Macintosh 7200 running System 7.5.2 with extensions off, I cannot use my modem or print to my serial printer. I know that on older computers, it was possible to do this. What changed?

DISCUSSION -----

The Power Macintosh 7200, 7500, 8500, and 9500 series computers all use the Apple Shared Library Manager (ASLM) extension which contains code for many system resources. If your computer is started with the extensions off, the Shared Library Manager is disabled, making system resources unavailable to execute serial communications. Other software which depends on ASLM would include QuickTake camera software and GeoPort software.

To avoid this, you need to update to System 7.5.3 using System 7.5 Update 2.0, which is available on the online services. In System 7.5.3 the serial ports will remain available in this disabled environment. Serial attached (non-AppleTalk) printers will function normally. Basic modem communications programs, such as MacTerminal, SITcomm, and White Knight, should also be usable.

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

Cyrillic Language Kit: Troubleshooting Common Issues (1/96)

Revised: 1/31/96
Security: Everyone

Cyrillic Language Kit: Troubleshooting Common Issues (1/96)

Article Created: 31 January 1996

TOPIC -----

This article contains information taken from the Cyrillic Language Kit manual concerning issues you may encounter while working in Cyrillic.

DISCUSSION -----

- I see odd characters that I cannot read in some of my file and folder names.

The font your system is using for file and folder names may not contain any Cyrillic characters. Cyrillic names cannot be properly displayed unless your system uses a font that contains Cyrillic characters. Choose Latinski in your Views control panel. Follow these steps to set the Views control panel:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Open the Views control panel.

Step 3

Press the "Font for views" pop-up menu.

Step 4

Choose Latinski (or any other Cyrillic font you prefer).

Step 5

Close the Views control panel.

The Latinski font contains Cyrillic characters as well as the most commonly used Roman characters. You can usually view Cyrillic and Roman file and folder names correctly by setting the Font for views to Latinski.

If you still see odd characters on your screen, read on.

- I changed my Views control panel to the Latinski font, but I still see odd characters in my Cyrillic application program.

Your system may not recognize your Cyrillic program as Cyrillic. To register a program:

Step 1

Open the Cyrillic Language Register. You'll find the Cyrillic Language Register in the Apple Extras folder on the hard disk where you installed the kit.

Step 2

Click the Register Application button. A list of application programs and folders appears.

Step 3

Select the application program you want to register.

Step 4

Click the Register button.

Now you can open your program and begin working.

You can also use a short-cut method to register your programs. If the program you want to register is open, quit it. Drag the program's icon to the icon for the Cyrillic Language Register. When the Language Register icon is highlighted, release the mouse button. A message confirms that the program is registered.

- I changed my Views control panel to the Latinski font, and now I cannot read some of my non-Cyrillic file and folder names.

If you have file or folder names that contain non-English Roman characters, such as accents or umlauts, they will not be correctly displayed after you change the Views control panel to the Latinski font. A few other characters, such as typographic quotation marks and ellipses, also will not be correctly displayed. This is because the Latinski font does not have a complete set of Roman characters, only the most commonly used ones.

In the Views control panel, choose a font that will correctly display your non-Cyrillic file and folder names. Then use non-Cyrillic names for all your files and folders, even those that contain Cyrillic.

Setting the Views control panel to Latinski is necessary only to read Cyrillic file and folder names. If you don't set the Views control panel, you will still see Cyrillic correctly displayed within your application programs. You can write and print in Cyrillic; remember to give your files non-Cyrillic names.

- I changed my Views control panel to the Latinski font, but I still see odd characters in my Application menu.

Not all the problems of working in multiple languages on one computer have been solved. Unfortunately, the Application menu cannot display Cyrillic names, even after you set your Views control panel to a Cyrillic font. The names of your Cyrillic application programs will not be correctly displayed in the Application menu and in certain dialog boxes.

Icons appearing in the Application menu next to each program's name will help you to identify your Cyrillic programs.

- I cannot edit a Cyrillic file or folder name.

You may have a non-Cyrillic keyboard selected in the Keyboards menu. Pull down the Keyboards menu and select a Cyrillic keyboard.

- I reinstalled one of my Cyrillic application programs. Do I need to re-register it in Cyrillic?

If the name of your program changes, you must re-register it.

- I cannot work in Cyrillic with my usual application program.

Your application program may not be completely compatible with other scripts. If it is not, it will not automatically switch to a Cyrillic font when you select a Cyrillic keyboard, or it may not let you see all the Cyrillic fonts in the font menu.

- Since I installed the Cyrillic Language Kit, unwanted keyboard layouts appear in my Keyboards menu. How do I remove them?

To remove unnecessary keyboard layouts, open the System file in the System folder. Select the unnecessary keyboard layouts and drag them to the Trash or into a temporary folder.

- Since I installed the Cyrillic Language Kit, I can no longer work with some of my other application programs, even in Roman.

This may be caused by a lack of memory. The Cyrillic Language Kit, when installed, is automatically loaded in memory at startup along with system software. Your system software takes up more space in memory, and the amount of

memory available for programs decreases.

Scribe Printer: Where to get Ribbon Cartridge (2/95)

=====

Article Created: 5 February 1996

TOPIC -----

Where can I get a replacement ribbon cartridge for the Apple Scribe thermal printer?

DISCUSSION -----

Apple no longer sells replacement ribbon cartridges for the Scribe printer. However, here are two third-party sources which usually have the ribbon cartridges in stock:

- Sun Remarketing
- APS Technologies

Another third-party source for the ribbon cartridges is Shreve Systems, which sometimes has these in stock.

AppleShare 4.2 to 4.2 v1.0.2 Patch: Read Me File (1/96)

Revised: 2/5/96
Security: Everyone

AppleShare 4.2 to 4.2 v1.0.2 Patch: Read Me File (1/96)

=====

Article Created: 5 February 1996

TOPIC -----

This article is the AppleShare 4.2 to 4.2 v1.0.2 Patch ReadMe file.

DISCUSSION -----

This patch updates AppleShare 4.2 to AppleShare 4.2 v1.0.2. This patch is only required for the U.S. version of AppleShare 4.2.

The following items have been fixed:

- Some sites that installed 4.2 over a previous version of AppleShare experienced problems because only one remote user at a time was able to run a particular application on the server.
- With the same application on two client machines, it was not possible to access the same file on a mounted volume at the same time. This was reported with multiple users trying to access the same HyperCard stack.
- If a file on a read access volume (both "See Folders" and "See Files" are selected, but not "Make Changes") was opened by an application other than the Finder, it was possible to make changes to the file and then save it back to the file server.
- Under certain timing-dependent conditions, the modification date on a file could be changed when moving the file to the server.

Installation Instructions

On a system with AppleShare 4.2 already installed, complete the following steps to upgrade to AppleShare 4.2 v1.0.2.

- 1) Launch the application named "File Server Ext 4.2->4.2 v1.0.2".

2) Click on the "Patch" button.

3) Navigate to your extension folder and select the file named "File Server Extension".

4) When the Save dialog is presented, select "Save" with the default name.

5) Select "Replace" when prompted to overwrite the old version of the File Server Extension.

The patch will only apply to an unmodified version of AppleShare 4.2. If any changes have been made with ResEdit, the patch will not apply.

PowerBook: Wrong Resolution In Monitors Control Panel (1/96)

Revised: 2/5/96
Security: Everyone

PowerBook: Wrong Resolution In Monitors Control Panel (1/96)

=====

Article Created: 5 February 1996

TOPIC -----

Why does the Monitors control panel on my Macintosh PowerBook 2300c still show 640x480 as the screen resolution in the Options after I switch to thousands of colors? Shouldn't it be 640x400?

DISCUSSION -----

A Macintosh PowerBook 2300c, 5300c (with 512k VRAM), or 540c (with the PowerPC upgrade) computer running System 7.5.2 will display the behavior you describe. That is, when you switch to thousands of colors in the Monitors control panel, the display resolution switches to 640x400 but the resolution listed in the Options portion of the control panel still shows 640x480.

The same situation is true in some older model Macintosh PowerBook computers with color active-matrix screens. It is normal for the display to switch to the 640x400 mode when in thousands of colors because 512k VRAM is not enough to display the same bit depth at 640x480.

Changes in the Display Manager in System 7.5.2 cause the Monitors control panel to retrieve the wrong string of display information and thus report a resolution 640x480 instead of 640x400.

This is a cosmetic anomaly that does not affect performance. It will be fixed in the next system software update. Macintosh PowerBook computers running system software versions later than 7.5.2 should not experience this issue.

PC Card Support for Desktop Macintosh Computers (1/96)

Revised: 2/5/96
Security: Everyone

PC Card Support for Desktop Macintosh Computers (1/96)

=====

Article Created: 5 February 1996

TOPIC -----

This article lists a third party solution that provides PCMCIA (also called PC card) support for desktop Macintosh computers.

DISCUSSION -----

Software Architects' PowerCard is a SCSI PCMCIA adapter which will work on most desktop Macintosh computers. The device accepts PCMCIA Type I, II, and III storage cards (including SRAM, flash RAM, and hard disk cards). It has a SCSI-2 interface, and is compatible with SCSI Manager 4.3.

In addition, it ships with Dayna Communications' DOS Mounter software, plus Software Architects' own driver; the combination makes it possible for users to mount DOS-formatted PCMCIA cards.

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendors, Software Architects or Dayna Communications, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Patch Kit for NetWare for Macintosh 4.1 (1/96)

Revised: 2/7/96
Security: Everyone

Patch Kit for NetWare for Macintosh 4.1 (1/96)

=====

Article Created: 5 February 1996

TOPIC -----

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

DISCUSSION -----

NOVELL TECHNICAL INFORMATION DOCUMENT

TITLE: Patch Kit for NetWare for Macintosh 4.1
README FOR: 41MAC5.EXE

NOVELL PRODUCTS and VERSIONS:
NetWare for Macintosh 4.10

ABSTRACT:
This patch kit contains all patches for NetWare for Macintosh 4.10.

DISCLAIMER

THE ORIGIN OF THIS INFORMATION MAY BE INTERNAL OR EXTERNAL TO NOVELL. NOVELL MAKES EVERY EFFORT WITHIN ITS MEANS TO VERIFY THIS INFORMATION. HOWEVER, THE INFORMATION PROVIDED IN THIS DOCUMENT IS FOR YOUR INFORMATION ONLY. NOVELL MAKES NO EXPLICIT OR IMPLIED CLAIMS TO THE VALIDITY OF THIS INFORMATION.

SYMPTOM:

ATPS.NLM v4.11 Pre-Release

Changes from v4.10:

- 1) The print server no longer sends a PAP EOF after detecting "%EOF" in binary PostScript data streams. Fixes SPD #94829.
- 2) No longer output a warning message about bindery logins failing unless operating in bindery mode. Fixes SPD #104688.
- 3) Fixed a problem where the spooler might report a "queue not found" error (820) if disabled. Fixes SPD #84177.
- 4) Supported the decoding of escaped special characters in PostScript ADSC comments. Fixes SPD #82435.
- 5) Fixed problem with hanging due to missing font list file. Fixes SPD #84171.
- 6) Added some new messages; should go through a translator pass when possible.
- 7) Enhanced the prefix() routine which turns .PRS into .PRI files to handle procsets commented by "%Begin/EndResource: procset".
- 8) To avoid DS synchronization problem, the print server should retry attempts to attach to the queue if "object not found" is returned.
- 9) Implemented "two strikes" feature for bad PostScript which causes the printer to reboot. The printer server put a job on user hold if it experiences a PAP time-out twice in a row.
- 10) Set necessary DS API flags so that ATPS can use queue alias objects transparently.
- 11) If the "*Product" keyword appears more than once in a PPD file, use the first instance.
- 12) Fixed a problem parsing info from PPD files in Macintosh format (i.e., with carriage return terminated lines).
- 13) Added an option to support LaserWriter 8/PSPrinter installable option queries. Parse the queries from the spooler's PPD file and use them to query the printer to get the answers. Requires that server and user PPD files agree on the installable options.
- 14) To support configurations where there is no query source, added spooler config option so the administrator can define installable options at the spooler. The keyword "PPD Option=<option>/<value>" may be added to the *.SPL file.
- 15) Added an option to support PostScript printers that do not reliably echo back PAP EOF's, which can cause a the printer server to hang. Adding "Verify Completion=No" to the *.PRN file causes the printer server to close the PAP connection as soon as all data is sent.
- 16) Refresh ImageWriter query information and status periodically, similarly to

PostScript queries.

17) If a spooler is being disabled, don't stop NBP advertising until all jobs are complete. Otherwise, LaserWriter driver PAPStatus() calls fail and printing is aborted.

18) Added support for parsing title and user from GDT Softworks PowerPrint drivers. Improved DeskWriter support.

19) Add short delay in responding to product queries to work around LW 7.2 set-up timing bug.

20) Support new "RBIAppleDevice" query made by LaserWriter 8.3 and "GXIsBinaryOK?" query to be made by future versions of GX.

21) Added spooler support for DeskWriter 540, 600, 660C.

ATPSCon 4.11 Pre-Release

9/18/95

Changes from 4.10 version of ATPSCon:

1) Fixed a problem where quick configuration files discarded by the the user would still be reported to ATPS for enabling.

2) Fixed a problem where quick configuration overwrote exisitng configuration files without telling ATPS to disable them.

3) Restored old functionality which allowed quick configurations to access an existing queue

4) Support display and selection of DS print queue alias objects

AFP 4.10a Pre-Release

8/10/95

Changes from 4.10 version of AFP:

1) Fixed server ABEND problem caused when the Desktop Database Rebuilder is executed.

2) Fixed a volume rename problem. If a volume was originally titled User_Disk, and then was changed to UserDisk, after the desktop was rebuilt, it showed up as UserDiskK.

3) Fixed a problem when volume names are similar and have a period in the name, the wrong volume mounts on the desktop.

APPLETLK 5.00e Release

Changes from 5.00 version of APPLETLK:

- 1) Fixed multiple abend problems.
- 2) Fixed printing problems seen with prior versions of AppleTalk ver 5.00b & 5.00c.

MAC.NAM 4.10a Pre-Release

8/29/95

Changes from version 4.10 of MAC.NAM:

- 1) Fixed a problem where the Macintosh name space should truncate names longer than 31 instead of 32 characters. The Macintosh system only supports 31 character file names.

SOLUTION:

Update server with all files.

Self-Extracting File Name: 41mac5.exe

Installation Instructions:

• MSG File installation Instructions:

- 1) Copy all MSG files to the F:\SYSTEM\NLS\4 directory

• MAC.NAM Installation Instructions:

- 1) Backup all volumes containing the Macintosh name space.
- 2) Update MAC.NAM, in the NWSERVER directory on the servers DOS partition.
- 3) Update V_OS2.NLM & VREPAIR.NLM located under F:\SYSTEM.
- 4) Reboot server to load the new MAC.NAM
- 5) Run Vrepair on all volumes that contain the MAC name space.

Copy all other NLMs to F:\SYSTEM.

LaserWriter 4/600 PS: Performing Memory Upgrades (2/96)

Revised: 2/6/96
Security: Everyone

LaserWriter 4/600 PS: Performing Memory Upgrades (2/96)

=====

Article Created: 5 February 1996

TOPIC -----

I have a LaserWriter 4/600 PS printer and I want to add additional memory. What do I need and how do I do it?

DISCUSSION -----

The LaserWriter 4/600 PS printer comes with 2MB of RAM pre-installed. An Apple-authorized service provider can install a 4MB memory expansion card (M4166G/A). The memory expansion card is designed specifically for the LaserWriter 4/600 PS. The printer is not equipped with industry-standard SIMM slots for installing additional memory.

The memory expansion card attaches to the I/O board on the printer, which requires the removal of the LaserWriter cover. Since removing the cover on a LaserWriter printer is not usually considered end-user replaceable part, Apple recommends you have the upgrade performed by an Apple-authorized service provider.

MacX 1.5: Using MacX 1.2 Fonts (2/96)

Revised: 2/6/96
Security: Everyone

MacX 1.5: Using MacX 1.2 Fonts (2/96)

=====

Article Created: 6 February 1996

TOPIC -----

I am trying to use MacX 1.2 fonts with MacX 1.5 but these fonts do not work. Is there a work around or solution for this?

DISCUSSION -----

MacX 1.5 does not support the compiled fonts in MacX 1.2. To add fonts to MacX 1.5 the fonts must be BDF or PCF format.

As of February 1996, MacX 1.5 does not support either compressed (.pdf.Z, .bdf.Z, or .spd), or outline formats. You can access these fonts from the Font server.

The MacX 1.5 manual contains a complete description on the installation and addition of Fonts to the MacX 1.5 Fonts list. You can either add fonts to an existing directory, or add a complete directory to the font path.

A complete description of this process is in the "MacX User's Guide," Chapter 9, page 103-104.

Support Professional Preview CD: New ARA Telephone Number (2/96)

Revised: 2/6/96
Security: Everyone

Support Professional Preview CD: New ARA Telephone Number (2/96)

=====

Article Created: 6 February 1996

TOPIC -----

Effective February 6, 1996, the Support Professional Preview CD has a new telephone number for dialing into the Support Information Server with the included Apple Remote Access (ARA) Client.

DISCUSSION -----

The Support Professional Preview CD includes trial versions of Support Professional software. This software enables you to remotely access a Support Information Server and initiate a search (Macintosh client only).

The SIS Sampler READ ME (path: Support Pro -> Trial Software -> SIS Folder), included on the Preview CD, has been slightly modified and will be included in the next revision of the Preview CD. The primary change to the SIS Sampler READ ME is the existence of a new phone number to connect to the remote Support Information Server. The old phone number is listed in the "Configuring Apple Remote Access Client" section of the READ ME file. Please change the phone number in this section to 1-512-908-8198. Also, if you use the SIS Sampler Access file (also on the Preview CD) to connect, please update the file with the new phone number (1-512-908-8198).

If you would like to receive Support Professional Solution Series ordering information and/or a free Support Professional Preview Kit on the Support Professional program, you may call 1-800-745-2775 between the hours of 7 a.m. and 10 p.m. Central Time.

PCI-Based Power Macintosh: Issue with SCSI ID 5 (4/96)

Revised: 4/18/96
Security: Everyone

PCI-Based Power Macintosh: Issue with SCSI ID 5 (4/96)

=====

Article Created: 6 February 1996
Article Reviewed/Updated: 18 April 1996

TOPIC -----

This article describes an issue affecting SCSI ID 5 on the following Power Macintosh series computers:

Power Macintosh 7200/75
Power Macintosh 7200/90
Power Macintosh 8500/120
Power Macintosh 9500/120
Power Macintosh 9500/132

DISCUSSION -----

On previous PCI-based Power Macintosh computers, there was an issue affecting SCSI ID 5, which may cause the computer to lock-up or the light on the SCSI 5 device to remain on constantly. The symptoms were most apparent when using array software, a scanner (when scanning), or a CD-ROM drive (without a CD-ROM disc inserted).

The issue was fixed in the SCSI Manager and was included in System 7.5.3. Newer PCI-based Power Macintosh computers which ship with System 7.5.3 should not have this problem, and previous PCI-based Power Macintosh computers can upgrade to System 7.5.3 by installing System 7.5 Update 2.0, which is available on the online services.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

18 Apr 1996 - Updated technical information.

Macintosh Computers: Testing Complete Error Message (2/96)

Revised: 2/6/96
Security: Everyone

Macintosh Computers: Testing Complete Error Message (2/96)

=====

Article Created: 6 February 1996

TOPIC -----

I just purchased a refurbished Macintosh computer. However, when I start up the computer, I get a message stating, "Unit passed, disconnect cables and send to packing." Following that message I hear an alert sound for about 20 seconds, and then another message appears stating, "Testing complete: connect all cables before clicking OK."

I've tried clicking OK, and I'm able to use the computer, but this happens each time I start up my computer. What could be going on?

DISCUSSION -----

It appears that a diagnostic program was mistakenly left active on your computer. Follow these steps to remove the program:

Step 1

Open the hard drive.

Step 2

Locate the Banzai folder and drag it to the Trash.

Step 3

Open the System Folder.

Step 4

Locate the Startup Items folder and drag it to the Trash.

Step 5

Empty the Trash.

An empty Startup Items folder will reappear in the System Folder after restart. However, the Launcher will no longer automatically launch after restart. To re-enable this function, select "Show Launcher at system startup" in the General Controls control panel.

This issue may affect any of the following refurbished Macintosh computers:

- Performa 6200 and 6100 series
- LC 580
- Performa 575, 577, 578
- Performa 630, 631, 636, 637, 638
- Power Macintosh 6100, 7100, 8100, 9500

Note:

The following computers are in the Macintosh 6100CD series: Macintosh 6100, Macintosh 6100 DOS Compatible, Performa 6110, Performa 6112, Performa 6115, Performa 6117, and Performa 6118.

The following computers are in the Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

MAE 2.0: Versions Supported, OS and MAE Patch Required (5/96)

Revised: 5/13/96
Security: Everyone

MAE 2.0: Versions Supported, OS and MAE Patch Required (5/96)

Article Created: 6 February 1996
Article Reviewed/Updated: 13 May 1996

TOPIC -----

This article discusses the compatibility of MAE with both Hewlett Packard (HP) HP-UX, and Sun Solaris, as well as any relevant patches that MAE requires for compatibility.

DISCUSSION -----

IMPORTANT NOTE: Installation of any other OS patches (beyond those required for MAE to function properly) is at the sole discretion of the customer. Apple Computer, Inc. makes no recommendations regarding the administration and maintenance of workstations on which the MAE product is installed.

However, in some cases, there are known issues that are addressed by a specific patch from the respected company and Apple recommends to have these systems patched to allow MAE to operate properly.

Current Versions Supported

HP-UX: 9.0.1, 9.0.3, 9.0.5, 9.0.7, 10.01 (MAE Patch 2 required for 10.01)
Solaris: 2.3, 2.4, 2.5

NOTE: As of April 1996, HP-UX 10.1 is not supported with MAE 2.0.2.

How Do I Determine Which OS Patches Are Installed

To determine which OS patches have been installed, use the following commands:

- For HP-UX:

what /HP-UX

- For Solaris

showrev -p

STREAMS (HP-UX only)

=====

MAE 2.0.x supports AppleTalk, which requires STREAMS (standard interfaces for I/O within the UNIX Kernel and between the kernel and user level). STREAMS is required on HP-UX 9.0.x. It is not required on HP-UX 10 and Solaris 2.x, as it is built into the OS.

HP-UX 9.0.1, 9.0.3: /cdrom/STREAMS/3STREAMS.TAR

HP-UX 9.0.5, 9.0.7: /cdrom/STREAMS/5STREAMS.TAR

Install all four file sets by using the /etc/update command:

/etc/update -rs /cdrom/STREAMS/3STREAMS.TAR '*'

or

/etc/update -rs /cdrom/STREAMS/5STREAMS.TAR '*'

OS Patches for HP-UX

=====

NOTE: HP patches tend to change often, and therefore this list may show outdated versions. The latest patch list can be found at the following URL:

<http://support.mayfield.hp.com/>

Patch levels used to validate MAE v2.0.2 with HP-UX 9.0.3, 9.0.5, 9.0.7 (HP-UX 10 requires no patches) are as follows:

PHKL_6760 Mega-Kernel Patch. Originally noted as PHKL_4605

PHNE_6707 Networking Patch. Originally noted as PHNE_3939

PHSS_4341 Audio Patch

PHSS_4568 X Server Patch. Originally noted as PHSS_4485 (This patch is not necessary for 9.0.7)

Known issues related to patch level:

PHNE_6707 Networking Patch. HP-UX 9.0.7, MAE 2.0.x freezes the HP-VUE Environment at startup

OS Patches for Solaris

=====

NOTE: Solaris patches tend to change often, and therefore this list may show outdated versions. The latest patch list can be found at the following ftp site:

sunsolve.sun.com.

Patch levels used to validate MAE v2.0.2 with Solaris 2.3 and 2.4 (Version 2.5 requires no patches) are as follows:

101318-75 Solaris 2.3 only, Jumbo patch for kernel
101907-09 Solaris 2.4 only, Jumbo patch for volume manager (Originally 102077)

Known issues related to patch level:

101945-36 Non-networked SPARC. Solaris 2.4 only, apply if MAE hangs at startup.
101907-05 Volume Manager Patch. Solaris 2.4 only, apply if CD/floppies do not mount, and macdisks.Solaris is configured correctly.

MAE Patches Required
=====

The current patch for MAE is Patch 2. This brings the version of MAE up to 2.0.2. The patch can be found at one of the following:

- www.mae.apple.com
- ftp.support.apple.com

It is recommended to upgrade to version 2.0.2, and is required for HP-UX 10.01. This Patch adds these features to MAE:

HP-UX Version 10.01 - (HP only)

HP-UX Version 10.01 can now be used with MAE. IMPORTANT: Be sure to read the file `README.PATCH.MAE2.0.2' on the FTP server prior to installing this patch to support HP-UX Version 10.01.

FDDI Support - (Sun only)

FDDI interfaces are now supported.

Ethernet Interfaces other than `le' - (Sun only)

MAE now supports Ethernet interfaces on Solaris such as qe. Previously, only le devices were supported.

Multiple Ethernet Interfaces

AppleTalk can now be used on any available (and supported) network interface. The Network Control Panel has been updated to add this functionality.

Persistent TIVs

Persistent TIVs are no longer truncated during shutdown.

Locking Mechanism for System Folder Updates

The updater utility for System Folders (part of the patch mechanism) no longer bypasses the file integrity lock if MAE is running. This only occurred under isolated circumstances.

Automounter Directory - (HP only)

The automounter directory for HP-UX (default /tmp_mnt) is now properly statused.

Solaris 2.4 and Automounted Directories - (Sun only)

MAE no longer truncates its internal file system list when executed in an environment with multiple remotely-mounted volumes. This symptom did not manifest itself under Solaris 2.3.

Sun 5 Keyboard - (Sun only)

The 0 (zero) key on Sun's Type 5 keyboard now functions properly.

Command line options

MAE will no longer exhibit random errors at startup based on the number of arguments supplied in the command line.

Updated man Page

The online manual pages now reflect changes and features of MAE 2.0 that were omitted from the man pages supplied with the MAE 2.0 distribution.

Network Control Panel

Opening the Network Control Panel will no longer result in an error message.

Attention Packets - (Sun only)

Urgent ADSP messages are now delivered promptly to the MAE process. Previously, there was a delay in delivering these messages.

ADSP Close - (Sun only)

Custom applications that send ADSP close packet now work correctly.

Utilization of Selected AppleTalk Zone

A previously-selected AppleTalk zone is now being used as the default zone. In addition, a list of eligible devices is presented when selecting a network

resource (e.g., printer). This problem only occurred under isolated circumstances.

File Transfers Under TCP

Fetch or other applications now pull large (>100K) files utilizing TCP correctly. (Smaller files were not affected.)

Saving Documents When Using MacinTax

MacinTax is now able to save documents.

Users' Guide Updated - (HP only)

The online Users' Guide for MAE now reflects features and changes present in v2.0 which were omitted from the MAE 2.0 distribution.

Debugging Options

Additional command line options have been added to assist in debugging MAE 2.0 problems.

Support for CacheFS - (Sun only)

New functionality was added to support CacheFS, a new file system introduced with Solaris 2.4.

Support For AFS (Andrew File System)

Additional features have been added to support local cells for AFS.

Other Fixes

Various minor bugs in MAE 2.0 are corrected in MAE 2.0.1

Article Change History:

13 May 1996 - Added HP-UX 10.1 note.
26 Mar 1996 - Corrected information.

HyperCard 2.3.5 Stacks: Read Me Files (2/96)

Revised: 2/7/96
Security: Everyone

HyperCard 2.3.5 Stacks: Read Me Files (2/96)

Article Created: 7 February 1996

TOPIC -----

This article contains the three ReadMe files from the 2.3.5 versions of HyperCard stacks Audio Help, Color Tools, and Power Tools posted online.

DISCUSSION -----

Please read this entire "Read Me" file. It contains important information and tips that will enhance your experience with the Audio Help stack. The Audio Help stack contains the Audio Palette, which gives HyperCard the ability to record new sounds and use them in your stacks.

CHANGES IN THE AUDIO HELP STACK

The following changes were made to the Audio Palette to make it work properly on newer Macintosh models, including the Power Macintosh 7200, 7500, 8500, and 9500, and to make it conform to Apple's guidelines for sound input.

- The Audio Palette now records at the following qualities: Good (22 kHz, 6-to-1 compression), Better (22 kHz, 3-to-1 compression), and Best (22 kHz, no compression). This is a change from older versions of the Audio Palette, which recorded at Good and Best qualities and had a different idea of Good quality (11 kHz, no compression).
- There is now a one-to-one correspondence between compression and quality settings. "No compression" is synonymous with "Best quality," "3-to-1 compression" with "Better quality," and "6-to-1 compression" with "Good quality."
- You can still open and edit sounds recorded with the old Audio Palette at its "Good" quality. When you do this, the new Audio Palette displays the quality as "Other".
- From a script, you can still set the "speed" property of the Audio Palette to

"11k". This will allow you to use the old "Good" quality. When you do this, the new Audio Palette displays the quality as "Other".

- The Audio Palette has a new property, "quality". From a script, you can set this property to "Good", "Better", or "Best".
- The documentation in the Audio Help stack has been updated to reflect the changes in the Audio Palette.

Please read this entire "Read Me" file. It contains important information and tips that will enhance your experience with the Color Tools stack. The Color Tools give HyperCard the ability to display and edit color images.

CHANGES IN THE COLOR TOOLS STACK 2.3.5

- The Color Tools now work more reliably on Macintosh systems that have the Japanese Language Kit or the Chinese Language Kit installed.
- The "Redraw Screen" command now works properly with stacks that have been colorized with other versions of the Color Tools.
- The "Compact Color Database" command now works properly with colorized cards and backgrounds whose IDs are greater than 32767.

CHANGES IN THE COLOR TOOLS STACK 2.3.3

- A problem was fixed that prevented stacks colorized with Color Tools 2.3 on a Macintosh computer with a PowerPC microprocessor from being used on a different Macintosh computer with a PowerPC microprocessor.

Please read this entire "Read Me" file. It contains important information and tips that will enhance your experience with the Power Tools stack. The Power Tools stack contains many useful tools that can help you to create or enhance your own HyperCard stacks.

CHANGES IN THE POWER TOOLS STACK

- The Super Grouper tool now works more reliably with a wider range of stacks.
- Starting with HyperCard 2.3, the option that allows the Picture XCMD to display a picture from the clipboard requires that the word "clipboard" be quoted, as follows:

Picture "From The Clipboard","clipboard"

The documentation in the Power Tools stack has been updated to reflect this change.

QuickTime 2.1: Stereo MIDI Files Play Back In Mono (2/96)

Revised: 2/7/96
Security: Everyone

QuickTime 2.1: Stereo MIDI Files Play Back In Mono (2/96)

=====

Article Created: 7 February 1996

TOPIC -----

I'm using QuickTime v2.1, QuickTime Musical Instruments v2.1, and Apple Movie Player v2.1 to create stereo MIDI file movies. When I try to play these stereo MIDI files back, they are in mono. What is wrong?

DISCUSSION -----

QuickTime 2.0 and 2.1 preserve MIDI panning information in the file, but the internal synthesizers playback in mono. If you play files through external synths that have stereo capability, you will get stereo output.

Future versions of QuickTime, scheduled for release in the second calendar quarter, should support stereo internal synths.

Power Macintosh 9500: Using a Epson Stylus Color Printer (2/96)

=====

Article Created: 8 February 1996

TOPIC -----

This article describes how to resolve printing issues when printing from a Power Macintosh 9500 to an Epson Stylus Color printer.

DISCUSSION -----

In order to successfully print from a Power Macintosh 9500 series computer to an Epson Stylus Color printer, follow these steps.

Step 1

Use the latest Epson printer driver. The drivers are posted on CompuServe, on Epson's BBS, and on Epson's web page:

<http://www.epson.com>

According to Epson, you can use version 2.0.3AE for serial connections and use version 2.0.2 for LocalTalk connections. Note that there are several versions of the Epson Stylus Color printer, and each has a slightly different driver. Contact Epson to verify which driver is recommended for your printer.

Step 2

Upgrade the firmware on the printer's motherboard. Contact Epson to identify the ROM size and upgrade it to the proper version.

Step 3

Upgrade to Open Transport v1.0.8, which is available on the online services.

Step 4

Install the System 7.5.2 Printing Fix 1.1, which is also available on the online

services.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

These articles can help you locate the software update mentioned here:

Apple Color StyleWriter 1500: Description (3/96)

Article Created: 9 February 1996
Article Reviewed/Updated: 22 March 1996

TOPIC -----

This article contains the description for the Apple Color StyleWriter 1500 printer.

DISCUSSION -----

Description
=====

The Apple Color StyleWriter 1500 offers a complete solution for easy and affordable color printing on Macintosh or PowerBook computers. This innovative ink-jet printer is perfect for home, education, and small-business users who require color printing capabilities at an affordable price.

Designed to fit easily into even the smallest of work spaces, the Apple Color StyleWriter 1500 provides a convenient, quiet, personal printing option—but one with advanced features. It produces output with impressive quality, offering laser-quality, 720- by 360-dpi resolution with edge smoothing on black-and-white pages, and 360- by 360-dpi resolution on pages containing color or gray-scale images. It prints quickly—3 pages per minute for black-and-white pages in normal mode and 0.3 page per minute for color. And it takes advantage of Apple's advanced ColorSync color-matching capabilities, so that the colors in your printed output match as closely as possible the colors on your display.

To support its performance, the Color StyleWriter 1500 provides native PowerPC software to speed the processing and printing of complex documents. And if you're looking for a direct-connect networking alternative, the Color StyleWriter 1500 can be used with the StyleWriter EtherTalk Adapter, for connection to an EtherTalk network.

In addition to performance, the Color StyleWriter 1500 also rates high on convenience and flexibility. It comes complete with all of the cables and ink

cartridges you need (color and black) and offers plug-and-play connection to virtually any Macintosh computer. It can be set up and installed easily. For flexible document design, the Color StyleWriter 1500 printer offers 64 available TrueType fonts for a wide range of type styles and sizes. And it can print not only on plain paper but also on a wide range of media, including glossy and premium paper, envelopes, transparencies, labels, and back-print film.

So if you want convenient color printing capabilities—at an affordable price—the Color StyleWriter 1500 is your ideal printing solution.

Features

=====

Outstanding print quality at an affordable price

- Produces great-looking documents contain-ing color images at 360 by 360 dots per inch
- Offers laser-quality printing by smoothing the edges of text and line art using 720 by 360 dots per inch for crisp black-and-white pages
- Supports ColorSync color-matching technology, ensuring the closest possible match between the colors you see on the screen and the colors that print
- Is priced low enough to make color accessible even to home users

Versatility, flexibility, and convenience

- Provides fast output up to 3 pages per minute for black and white—in both the ink-saving draft mode and the sharp-quality normal mode
- Takes advantage of the high performance of PowerPC processor-based computers to speed the processing and printing of complex documents
- Features a small, sleek design that fits on virtually any desktop
- Offers the option of printing on a wide range of media, including plain paper, transparencies, glossy and premium paper, back-print film, labels, and envelopes
- Automatically turns itself on when it receives a document and turns itself off when it finishes printing
- Gives you a choice of 64 scalable TrueType fonts for printing in any size and in a variety of styles
- Can be used with the StyleWriter EtherTalk Adapter, for direct connection to an EtherTalk network

Ease of use

..TIL19320-Apple_Color_StyleWriter_1500-Description_3-96_(TA35062).pdf

- Comes with everything you need to get started right away; includes all necessary cables and both black and color ink cartridges
- Supports plug-and-play connection to virtually any Macintosh, PowerBook, or Power Macintosh computer
- Provides "desktop printing"; you can print files by simply dragging them onto a desktop printer icon
- Lets you print two or four reduced-size pages on a single sheet of paper, saving paper, ink, and time for review of multipage documents
- Allows you to place watermarks in the background of your documents quickly and easily

Article Created: 9 February 1996
Article Reviewed/Updated: 20 March 1996

TOPIC -----

This article contains the Technical Specifications for the Apple Color StyleWriter 1500 printer.

DISCUSSION -----

Technical Specifications
=====

Print Method:
- Thermal ink jet

Print Quality:
- 720 by 360 dpi for edge smoothing on black-and-white documents
- 360 by 360 dpi for color and gray-scale documents

Interfaces:
- High-speed serial (885 Kbps)
- Optional direct network connection through the Apple StyleWriter
 EtherTalk Adapter

Speed:
- Up to 3 pages per minute for black-and-white normal mode
- Up to 0.3 page per minute for color and gray scale
- Actual speed depends on the documents printed and the Macintosh used

Fonts:
- TrueType font support
- Adobe PostScript font support when used with Adobe Type Manager software

Typefaces included with Apple Color StyleWriter 1500:

Begin_Table

- ITC Avant Garde	- Helvetica Compressed	- Old English Text
- ITC Bookman	- Helvetica Narrow	- Onyx Narrow
- Chicago	- ITC Lubalin Graph	- Oxford
- Courier	- Lucida Bright	- Palatino
- Delphian	- ITC Machine	- Swing
- ITC Garamond Narrow	- Monaco	- Symbol
- Geneva	- Nadianne	- Times
- Helvetica	- New Century Schoolbook	- ITC Zapf Chancery
- Helvetica Black	- New York	- ITC Zapf Dingbats
		- Zeal

End_Table

Ink Cartridges:

- Color Ink Cartridge—all-in-one print head and color ink tanks (cyan, magenta, and yellow)
- Black Ink Cartridge for black-and-white printing

Paper Capacity:

- Multipurpose tray that accommodates up to 100 sheets of paper or 15 envelopes

Print Materials:

- 16- to 24-lb. (60 to 90 g/m²) bond or copier paper
- Paper: U.S. letter, U.S. legal, A4, executive, and envelopes (#10 business and #6)
- Most letterhead and colored stock, labels, and envelopes
- For superior graphics and imaging results, Apple recommends Apple premium or glossy paper and Apple back-print media

Printable Surface:

- Maximum printable line: 8.0 in. (20.3 cm)
- Minimum margins: 0.25 in. (0.63 cm)

Size and Weight:

- Height: 6.9 in. (17.6 cm)
- Width: 13.7 in. (34.8 cm)
- Depth: 8.5 in. (21.5 cm)
- Weight: 5.5 lb. (2.5 kg)

Power Requirements:

- U.S./Japan: 100 to 120 V AC; 48 to 62 Hz
- Europe/Australia: 220 to 240 V AC; 48 to 62 Hz

Power Consumption:

- Operating mode: 22.6 W (maximum) at 120 V and 220 V

Operating Environment:

- Temperature: 59 to 86 deg. F (15 to 30 deg. C)
- Humidity: 10% to 80% noncondensing

System Requirements:

- An Apple Macintosh personal computer with a 68020 or later processor, Power Macintosh system, or PowerBook computer, with at least 4MB of RAM (5MB recommended) and a hard disk drive. Requires Color QuickDraw. Color QuickDraw first shipped with the Macintosh II, and is in every Macintosh II class computer, which includes the SE/30. This EXCLUDES the Macintosh Plus, Macintosh Classic, Macintosh SE, and Macintosh PowerBook 100 (they will not print in color).
- System software version 7.1 or later
- Supports Quickdraw GX

PowerBook: Generic System 7.5.2 Software Installer Icon (2/96)

Revised: 2/9/96
Security: Everyone

PowerBook: Generic System 7.5.2 Software Installer Icon (2/96)

=====

Article Created: 9 February 1996

TOPIC -----

I am trying to reinstall my System 7.5.2 software on my PowerBook 190, 2300c, or 5300 series computer. I have started from the Disk Tools disk that came with my PowerBook, but when I double-click the System Software installer alias on the Disk Tools disk, I get a message, saying the original item cannot be found. I also notice that the alias is a generic document icon. What is wrong? How can I fix this?

DISCUSSION -----

The System Software installer alias on the Disk Tools disk is an alias to the System Software installer application on the hard drive of your PowerBook. The path the alias follows can be lost if you rename your hard drive to something other than Macintosh HD, or if you move the System Software Installer application out of the System Software Images folder. Even if you name your hard drive back to Macintosh HD or put the System Software installer back into the System Software Images folder, the alias will still be unable to open the application.

You can work around this issue by double-clicking the System Software installer application on your PowerBook's hard drive instead of double-clicking the alias on the Disk Tools disk. If you have not relocated any folders on your hard drive, the application can be found on the hard drive by following the path:

Hard Drive -> Utilities -> Floppy Disk Maker -> Disk Images -> System Software Images -> System Software Installer

You can also fix the unresolved alias on the Disk Tools disk by following this procedure:

Step 1

Before inserting the disk into your floppy drive slide the plastic write protect

tab in the upper left corner, of the bottom of the disk (side with the silver disk in the center) to cover the hole. Insert the floppy disk into your floppy drive.

Step 2

Locate the System Software Installer application on your hard drive. If you have not relocated any folders on your hard drive, it can be found by following the path:

Hard Drive -> Utilities -> Floppy Disk Maker -> Disk Images -> System Software Images -> System Software Installer

You can also use Find... under File to locate the application.

Step 3

Click the System Software Installer application once to highlight it. Under File, choose Make Alias.

Step 4

Drag the alias you have just created to the Disk Tools disk. When asked if you want to replace items with the same name, click OK. When the file is finished being copied you should have the alias in both the Disk Tools disk and the System Software Images folder. You can drag the alias from the System Software Images folder to the Trash.

Step 5

Drag the Disk Tools disk icon to the Trash to eject it. Lock the floppy disk by sliding the write protect tab back to cover the hole in the corner.

Apple Color StyleWriter 2500: Description (4/96)

Article Created: 9 February 1996
Article Reviewed/Updated: 12 April 1996

TOPIC -----

This article contains the description for the Apple Color StyleWriter 2500 printer.

DISCUSSION -----

Description
=====

The Apple Color StyleWriter 2500 is a compact, elegantly designed ink-jet printer that provides outstanding performance for both color and black-and-white printing. It's ideal for home, education, and small-business users who require convenient, superior-quality color capability without com-promising true black text.

With its 720- by 360-dpi resolution for both color and black and white and its support for ColorSync color-matching technology, the Color StyleWriter 2500 easily prints high-quality text and images. It even features optimal ink density, which automatically adjusts the ink saturation to provide the best possible output on a variety of media (papers, transparencies, and back-print film). And the speed of this printer is also a strong point: the Apple Color StyleWriter 2500 prints up to 5 pages per minute for black and white and up to 0.66 page per minute for color.

Whether you use the Color StyleWriter 2500 to print your household budget, your child's latest art project, a class handout, or a customer presentation, you'll appreciate the quality and convenience of this printer's fast-drying, water-resistant ink. And you'll find the Apple Color StyleWriter 2500 equally convenient to own. It's extremely simple to set up and can be shared over a network in several ways. Through Apple's ColorShare technology, the Color StyleWriter 2500 can be shared with others over a LocalTalk, EtherTalk, or TokenTalk network. Or you can choose to add the optional LocalTalk module or the

..TIL19323-Apple_Color_StyleWriter_2500-Description_4-96.pdf

StyleWriter EtherTalk Adapter, for direct connection to a LocalTalk or EtherTalk network.

So if you want outstanding print quality and color capability—in a convenient, flexible printer—the Apple Color StyleWriter 2500 is the printer for you.

Features

=====

Outstanding print quality

- Prints Macintosh documents in millions of vibrant colors at high resolution—up to 720 by 360 dots per inch; to ensure consistent high-quality results, the printer automatically chooses the optimal ink density for the paper you're using
- Gives you a choice of 64 scalable TrueType fonts for printing in any size and in a variety of styles
- Allows you to combine vivid color images with true black text on the same printed page
- Uses Apple's ColorSync technology to ensure the closest possible match between the colors you see on your display and the colors printed in your documents

Convenience

- Takes advantage of the high performance of PowerPC processor-based computers to speed the processing and printing of complex documents
- Features a small, sleek design that fits on virtually any desktop
- Prints quickly (up to 5 pages per minute in black-and-white; 0.66 page per minute in color)
- Offers the option of printing on a wide range of media, including plain, premium, and glossy paper, transparencies, back-print film, and envelopes
- Automatically turns itself on when it receives a document and turns itself off when it finishes printing

Ease of use

- Supports plug-and-play connection to virtually any Macintosh, PowerBook, or Power Macintosh computer
- Is easy to set up and install
- Provides "desktop printing"; you can print files by simply dragging them onto a desktop printer icon

..TIL19323-Apple_Color_StyleWriter_2500-Description_4-96.pdf

- Allows you to place watermarks in the back-ground of your documents quickly and easily
- Lets you print two or four reduced-size pages on a single sheet of paper, saving paper, ink, and time for review of multipage documents

System 7.5.x: Must Choose Printer to Use Ofoto 2.0.x (2/96)

Revised: 2/9/96
Security: Everyone

System 7.5.x: Must Choose Printer to Use Ofoto 2.0.x (2/96)

Article Created: 9 February 1996

TOPIC -----

I have recently upgraded to System 7.5.1 on my Macintosh computer. When I try to access any of the functions like Preview or Autoscan in Ofoto 2.0.x, I get a message that says "Couldn't complete the last command because of a Mac OS error. Result Code = -39".

I have received this same error when using the Extensions Manager to disable all extensions not necessary to run Ofoto.

DISCUSSION -----

You must have a printer selected in the Chooser in order for Ofoto to run properly. Follow these steps to select a printer:

Step 1

Choose the Chooser under the Apple Menu.

Step 2

Click to select your printer's driver in the left side of the Chooser.

Step 3

Click to select the modem or printer port on the right side of the Chooser, or select the name of your AppleTalk printer.

Step 4

Click the close box in the upper left corner of the Chooser.

You can now use all of Ofoto's functions.

Security: Everyone

Apple Color OneScanner 600/27: Technical Specifications (9/96)

=====

Article Created: 12 February 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

This article contains the Apple Color OneScanner 600/27 technical specifications.

DISCUSSION -----

Technical Specifications
=====

General

- Scanner type: Single-pass, 27-bit scanning
- Color capabilities: Recognizes up to 134 million colors internally and 16.7 million externally
- Optical scanning resolution: 300- by 600-dots per inch, 2400- by 2400-interpolated resolution
- Maximum scan area: 8.5 by 11.5 in. (21.6 by 29.2 cm)
- Scanning engine speed: Full-page scan, less than 20 seconds; preview scan, less than 6 seconds
- Interface: SCSI-2
- File formats: Supports PICT, TIFF, JPEG, EPS, Photoshop 2.5, and BMP; compatible with most popular word processing, presentation, Image-editing, and page-layout software for the Macintosh
- Illumination: Cool-scanning Xenon bulb

Optional accessories

- Automatic Document Feeder with 20-page capacity (M4526G/A)

OneScanner Dispatcher software

- Controls scanning, OCR, editing, printing, faxing, copying, archiving, and retrieving images
- Supports Drag and Drop

Additional software

- Xerox TextBridge 3.0 OCR software
- Photoshop plug-in acquire scan module

ColorSync 2.0 Architecture

- Matches colors from scanned input to display to printed output
- Provides automatic color matching
- Works with color-capable Macintosh computers and color input and output devices that take advantage of ColorSync

Electrical Requirements

=====

- Line voltage: 100/120/200/220/240 V AC + 10%
- Frequency: 50 to 60 Hz, single phase
- Power: 28 W (maximum)

Environmental Requirements

=====

- Temperature: 50 to 104 deg. F (10 to 40 deg. C)
- Humidity: 10% to 80%, noncondensing
- Altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and Weight

=====

- Height: 3.1 in. (7.9 cm)
- Width: 11.3 in. (28.7 cm)
- Depth: 16.3 in. (41.4 cm)
- Weight: 13.2 lb. (6.0 kg)

System Requirements

=====

- System software version 7.5 or later

..TIL19327-Apple_Color_OneScanner_600-27-Technical_Specifications_9-96.pdf

- At least 8MB of RAM (12MB required to use OneScanner Dispatcher and TextBridge OCR software simultaneously)
- At least a 13-in. display (640x480), or PowerBook capable of displaying a 640x480 resolution.

Ordering Information

=====

Apple Color OneScanner 600/27

Order No. M4496LL/A

- Apple Color OneScanner 600/27
- OneScanner Dispatcher software
- Xerox TextBridge 3.0 OCR software and user's guide
- Photoshop plug-in acquire scan module
- User's guide
- Limited warranty

Automatic Document Feeder

Order No. M4526G/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Article Change History:

- 01 Aug 1996 - Added display/resolution requirements.
- 26 Jul 1996 - Minor change to doc feeder order number.
- 21 May 1996 - Added part number for document feeder

Apple Color OneScanner 600/27: Description (3/96)

Article Created: 12 February 1996
Article Reviewed/Updated: 28 March 1996

TOPIC -----

This article contains the Apple Color OneScanner 600/27 description.

DISCUSSION -----

Description
=====

The Apple Color OneScanner 600/27 is a highly affordable, highly capable scanner that lets you enhance your documents and presentations with high-quality color images for maximum impact. And it makes not only scanning but also a variety of related functions easier than ever before.

With its 300- by 600-dot-per-inch optical resolution and bit depth of 27 bits, the Apple Color OneScanner 600/27 provides images with impressive quality. Its color capabilities are equally impressive: It recognizes up to 134 million colors internally and supports ColorSync 2.0 color matching, so the image you see on the display or on printed output accurately and vividly reproduces the quality of the original scan.

But high-quality images are only part of the OneScanner story. The OneScanner Dispatcher software that comes with this scanner brings a new level of ease to scanning and document handling. This software makes it simple to use the Apple Color OneScanner 600/27 in conjunction with your Mac OS computer, fax modem, and printer, enhancing your productivity by letting you handle a variety of document processing activities in an intuitive, integrated fashion. In addition, to ensure that you get the most out of your scanner, the Apple Color OneScanner 600/27 includes two other useful software packages. Xerox TextBridge 3.0 optical character recognition (OCR) software lets you scan printed pages directly into your computer as text files that you can edit and format—eliminating the need for time-consuming rekeying of text. It features an impressive accuracy rate of up to 98.5 percent. The second software tool, a Photoshop acquire module, lets

..TIL19328-Apple_Color_OneScanner_600-27-Description_3-96.pdf

you scan directly into Adobe Photoshop and Photoshop plug-in compatible software.

But for all of its impressive capabilities and unprecedented ease of use, the Apple Color OneScanner 600/27 remains highly affordable. So whether you're a teacher working with your students to create a newsletter, a freelance graphic designer producing a brochure, or someone who simply wants to jazz up your annual holiday form letter, the Apple Color OneScanner 600/27 is the perfect scanner to meet your needs.

Features

=====

Ease of use

- Provides automated, single-pass scanning
- Comes with OneScanner Dispatcher software, which provides a variety of integrated functions like scanning, optical character recognition (OCR), editing, printing, faxing, copying, archiving, and retrieving images in one easy-to-use interface

Image quality

- Offers 300- by 600-dot-per-inch optical (2400- by 2400-interpolated) resolution at 27 bits
- Recognizes more than 134 million colors internally and 16.7 million externally
- Features a cool-scanning Xenon bulb that provides daylight balanced illumination for better image quality and protects valuable originals from heat damage
- Supports ColorSync 2.0 color matching, for excellent color fidelity from original scanned image to screen image to printed image Value-added software
- Includes industry-leading Xerox TextBridge 3.0 OCR software (in Japan, eTypist 1.0), which lets you scan printed pages directly into your computer as digital files—eliminating the need for time-consuming and error-prone rekeying
- Comes with a Photoshop acquire scan module, which lets you scan directly into Photoshop and compatible software Compatibility
- Supports PICT, TIFF, JPEG, EPS, Photoshop 2.5, and BMP formats
- Is compatible with most popular word processing, presentation, Image-editing, and page-layout software for the Macintosh

AICK 1.0: Claris Emailer Lite and LAN Configuration (2/96)

Revised: 2/12/96
Security: Everyone

AICK 1.0: Claris Emailer Lite and LAN Configuration (2/96)

=====

Article Created: 12 February 1996

TOPIC -----

This article describes a configuration issue with Claris Emailer Lite, a part of the Apple Internet Connection Kit (AICK) 1.0, when connecting to the Internet through a Local Area Network (LAN).

DISCUSSION -----

Claris Emailer Lite will load some of its parameters from the pre-configured Internet Config database. The Internet Config database is the Internet Preferences file in the Preferences folder. When used in a dialup configuration, the Apple Internet Dialer populates the Internet Config database with appropriate entries. However, when used in a LAN configuration, the required fields (email address, pop server, and so on) are not entered into the database, and this information cannot be edited using the Emailer Lite application.

The Internet Config application, distributed with AICK (in the Internet Utilities folder), can be used to set these needed preferences. The Internet Config application has clear and extensive balloon help if it's unclear what to enter in the fields. Once you have made the entries in Internet Config application, Claris Emailer Lite loads these parameters from the Internet Config database the next time Emailer Lite is launched.

Revised: 2/12/96
Security: Everyone

Performa: No Volume Control With Some Applications (2/96)

=====

Article Created: 12 February 1996

TOPIC -----

I have a Macintosh Performa computer, which included Sesame Street Numbers and Power Pete in the software bundle. However, I have noticed that when I open either of these applications, I can no longer adjust the sound using the front panel volume buttons.

DISCUSSION -----

It appears that this symptom only occurs if the Video Startup extension is installed or active when you attempt to use either Sesame Street Numbers or Power Pete. Once you quit those applications, you can control the volume normally again.

At this time, the only way to avoid this is to disable the Video Startup extension using the Extensions Manager control panel.

StyleWriter EtherTalk Adapter: Description (5/96)

Revised: 5/14/96
Security: Everyone

StyleWriter EtherTalk Adapter: Description (5/96)

Article Created: 12 February 1996
Article Reviewed/Updated: 14 May 1996

TOPIC -----

This article contains the StyleWriter EtherTalk Adapter product description.

DISCUSSION -----

Product Description
=====

The StyleWriter EtherTalk Adapter is a simple, compact device that lets you connect your Apple ink-jet printer directly to an EtherTalk local area network (LAN). It's the ideal way to share a single printer among multiple computers on an EtherTalk network.

Designed for convenience, the StyleWriter EtherTalk Adapter is small enough to make it easy to place, and is also extremely simple to set up. It connects directly to the printer's high-speed serial port and requires no additional software. With both 10Base-T and 10Base-2 connectors built in, it supports Apple Macintosh, Power Macintosh, and PowerBook computers; Apple EtherTalk networks; and Apple ink-jet printers, including the StyleWriter (1), StyleWriter II (1), StyleWriter 1200 (1), Color StyleWriter 1500, Color StyleWriter 2200, and Color StyleWriter 2500, as well as the Color StyleWriter 2400 (2). And the StyleWriter EtherTalk Adapter features easy-to-read LEDs that display your network connection status for easy troubleshooting.

These days, most organizations—and particularly schools—are feeling an economic pinch. The StyleWriter EtherTalk Adapter makes printing much more economical by allowing one printer to serve a number of people over a high-speed network. In fact, an EtherTalk connection can provide performance up to four times faster than a LocalTalk connection, making printer sharing more practical.

So if you own—or are about to buy—an Apple ink-jet printer, and you want to get the best possible shared performance from it, the StyleWriter EtherTalk Adapter

is the product for you.

Notes:

(1) - The StyleWriter 1200, StyleWriter and StyleWriter II printers require StyleWriter 1500 print driver version 2.2 or later.

(2) - Requires printer driver version 1.6.1 or later.

Features

=====

Ease of use

- Offers easy installation
- Provides easy-to-read LEDs that let you see your network connection status at a glance
- Uses standard Apple ink-jet printer drivers
- Supports connection to either 10Base-T or 10Base-2 cabling

Performance

- Lets you print up to four times faster than you can with a LocalTalk connection

Affordability and convenience

- Allows a single Apple ink-jet printer to be shared simply
- Features a convenient, attractive, and compact design

Technical Specifications
=====

Product description

An external EtherTalk network printer adapter that directly connects Apple ink-jet printers to an EtherTalk local area network.

Printers supported

- Color StyleWriter 2500 (QuickDraw and QuickDraw GX)
- Color StyleWriter 2400 (QuickDraw and QuickDraw GX) (2)
- Color StyleWriter 2200 (QuickDraw and QuickDraw GX)
- Color StyleWriter 1500 (QuickDraw and QuickDraw GX)
- StyleWriter (QuickDraw) (1)
- StyleWriter II (QuickDraw) (1)
- StyleWriter 1200 (QuickDraw) (1)

Notes:

- (1) - The StyleWriter 1200, StyleWriter and StyleWriter II printers require

StyleWriter 1500 print driver version 2.2 or later.

(2) - Requires printer driver version 1.6.1 or later.

Protocol

- EtherTalk

Interface

- 10Base-T (Twisted Pair, RJ-45) or 10Base-2 (Thin Net, Thin Coax, BNC) connectors
- High-speed (up to 885 Kbps) serial (RS-422) to printer

Power

- External power adapter

Requirements

Apple StyleWriter or Color StyleWriter printer; 10Base-T or 10Base-2 cables suitable for your EtherTalk network; StyleWriter printer driver version 1.6.1 or later

Size and weight

- Height: 1.2 in. (30 mm)
- Width: 2.9 in. (75 mm)
- Depth: 4.5 in. (115 mm)
- Weight: 0.24 lb. (110 g) (excluding AC power adapter)

Apple PCI Token Ring Card: Description & Specifications (5/96)

Article Created: 14 February 1996
Article Reviewed/Updated: 30 May 1996

TOPIC -----

This article provides the description and specifications for the Apple PCI Token Ring Card.

DISCUSSION -----

Features
=====

The Token Ring Solution for PCI Macintosh, The Apple PCI Token Ring Card, provides Apple Workgroup Servers and Power Macintosh models equipped with a Peripheral Component Interconnect (PCI) slot with the ideal Token Ring connectivity solution for all of your networking needs. It supports a wide range of protocols, including AppleTalk, TCP/IP, and IPX, allowing the use the Apple PCI Token Ring Card with other network systems, such as Netware and AIX.

NOTE: The Apple PCI Token Ring Card supports IPX protocols. However, as of April 1996, the MacIPX control panel from Novell depends on NuBus specific APIs to locate networking cards. Therefore, the curent MacIPX software does not support the Apple PCI Token Ring Card.

High Performance

Featuring a compact (6.88-inch) design, the Apple PCI Token Ring Card provides exceptional performance at a highly affordable price. When used with network software that has been optimized for maximum performance, this card offers a cost-effective, flexible Token Ring solution for connecting Power Macintosh computers to Apple Workgroup Servers and other PCI-equipped personal computers or to mainframes. The Apple PCI Token Ring Card offers access to a variety of network services such as file servers, client/server applications, mainframe services, electronic mail, and databases.

- Offers optimal efficiency in client and server environments through its use of the high-performance IBM chip set
- Allows concurrent execution of multiple networking protocols to optimize network performance
- Ships with Apple Open Transport architecture and DLPI network driver software
- Supports full 32-bit bus mastering data interfaces for maximum throughput
- Can be used in configurations ranging from an individual card in a single system to multiple-card, server-based configurations
- Supports PCI bus speeds of up to 132 megabytes per second

Full Compatibility

The Apple PCI Token Ring Card uses the IBM Token Ring chip set, which ensures its compatibility and inter-operability with all IBM Token Ring networks that operate at 4 or 16 megabits per second. Used in conjunction with a Power Macintosh with the DOS Compatibility Card* installed or a Power Macintosh running Insignia Solutions SoftWindows DOS/Windows emulation software, this card can provide a seamlessly integrated cross-platform solution to all of your application and networking needs.

* The Apple PCI Token Ring Card is not compatible with Apple's PCI DOS Compatibility Card.

- Works with the following Macintosh and Performa models with a PCI slot:
 - Power Macintosh 7200/120 computers
 - Power Macintosh 5400 Performa computers
 - Power Macintosh 7500, 7600, 8500, and 9500 series computers
 - Workgroup Server 7250
 - Workgroup Server 8550 series computers
- Complies with IEEE 802.5 and 802.2 standards
- Uses the IBM Token Ring chip set, which provides complete compatibility with IBM environments
- Supports a variety of popular networking protocols, including AppleTalk, TCP/IP, IPX, SNA, and OSI
- Easily integrates into multi-vendor environments
- Adapts to any standard Token Ring cabling environment
- Offers compatibility with any Intel or DEC Alpha systems equipped with a PCI local bus slot

Easy Installation

This convenient, easy-to-install card requires no configuration, features superior network performance, and affords the flexibility of connection to both LAN and mainframe-based services. So if your goal is seamless inter-operability in multi-vendor environments, Apple PCI Token Ring Card can help you to achieve it.

- Installs quickly and easily in a single step
- Ships with multilingual software, which makes it ready for use with

different language versions of the system software

- Provides automatic sensing of Token Ring network speed: automatically inserts at 4 or 16 megabits per second, as appropriate

Specifications

=====

System Requirements

- One available PCI slot
- IBM Type 3 cabling (unshielded twisted pair) or IBM Type 1 cabling (shielded twisted pair) with use of an external adapter
- Industry-standard Token Ring Multistation Access Unit (MAU)

Connector

- RJ-45 connector for attaching to Type 3 cabling

Transmit/Receive Data Rate

- 4- or 16-megabit-per-second maximum data rate

Environmental Requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Humidity: 25% to 95% noncondensing at a temperature range of 25 to 40 degrees C

Power Dissipation

- Rated at 4 W, maximum 5 W, average 3.5 W
- Maximum current draw is 1 amp at 5 volts

Token Ring Controller

- IBM Token Ring Controller 73G2692

Standards Compliance/Agency Approvals

- FCC Class A, CE Mark, VCCI
- PCI 2.1 compatible, IEEE 802.5 and 802.2

Article Change History:

30 May 1996 - Updated 7200 compat info.

14 May 1996 - Updated with more detailed compatibility info.

19 Apr 1996 - Added note on MacIPX software.

Apple MessagePad 130: Description (3/96)

Article Created: 12 February 1996
Article Reviewed/Updated: 14 March 1996

TOPIC -----

This article contains the Apple MessagePad 130 product description.

DISCUSSION -----

Description
=====

The MessagePad 130 personal digital assistant (PDA) makes your information as mobile as you are.

It makes your information easy to communicate and easy to view. The MessagePad 130 runs the award-winning Newton 2.0 operating system, and features user-controllable back-lighting for on-demand use and a nonglare screen that works in any lighting condition.

With its additional system memory, the MessagePad 130 offers improved performance with communications solutions such as Internet Protocol (IP) applications and wireless LANs, as well as improved multitasking support.

It has a built-in notepad, to-do list, datebook, telephone log, and address file for organizing personal and business affairs, as well as Pocket Quicken (U.S. only) to help organize personal and business expenses.

You can enter information in many ways: as digital ink, printed text, hand-drawn graphics, or with an on-screen keyboard. Improved recognition software quickly transforms your hand-writing into typed text. There's even an optional external keyboard.

Pen-based navigation and data entry make finding information easy and fast.

The MessagePad 130 can receive wireless messages and alphanumeric pages, and can

..TIL19335-Apple_MessagePad_130-Description_3-96.pdf

send and receive faxes and electronic mail.

It also lets you exchange information with either Mac OS- or Windows-based computers using the included Newton Backup Utility, or optional Newton Connection Utilities and Newton Press software.

Your MessagePad 130 can also be customized with software applications that put critical information at your fingertips, no matter where you are.

Features

=====

Built-in organization functions

- Helps you plan monthly, weekly, and daily activities using the calendar, and manage priorities using the To Do List
- Allows free-form notes, outlines, lists, and phone logs
- Includes customizable name and address files for colleagues and friends, using various business-card formats
- Offers an assortment of information and productivity tools such as time-zone maps, a calculator, and currency exchange
- Includes Pocket Quicken (U.S. only), which puts current information about your cash, checking, savings, and credit-card accounts at your fingertips

Built-in communications

- Actively assists you in making phone calls, faxing, printing, finding information, and sending and receiving electronic mail
- Uses an optional wired or wireless modem to send and receive faxes and electronic mail
- Prints formatted letters and notes using Apple printers or serial or parallel printers with the optional Print Pack
- Lets you beam notes, messages, packages, schedules, and business cards via built-in infrared communications
- Backs up all data onto your personal computer and installs software on your MessagePad 130 using the included Newton Backup Utility

Expandable functions

- Using the optional Newton Connection Utilities, lets you import and export information from your Mac OS- or Windows-based computer, and backs up and synchronizes files with your computer

..TIL19335-Apple_MessagePad_130-Description_3-96.pdf

- Works with PC cards and serial peripherals such as keyboards, modems, pagers, and wireless communications and storage products
- Offers a large selection of productivity, finance, time and billing, information management, reference, electronic document publishing, and entertainment software

Ordering Information

=====

MessagePad 130 2.5MB

Order No. H0188LL/A

- MessagePad 130 personal digital assistant with Newton 2.0 operating system
- Telescoping Pen
- Batteries
- Newton Backup Utility software for Mac OS- and Windows-based computers
- Serial cables for Mac OS- and Windows-based computers
- Pocket Quicken software (U.S. only)
- Complete setup, learning, and reference documentation
- Limited warranty

Accessories

=====

- The MessagePad 130 with Newton 2.0 operating system is compatible with most accessories available for the MessagePad 110 and MessagePad 120 with Newton 1.x or 2.0 operating system. Please see the MessagePad Accessories data sheet for detailed information.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Technical Specifications
=====

Newton Intelligence
=====

Newton Recognition Architecture

- Recognizes handwriting—printed, cursive, or a mixture of the two—with the assistance of a 93,000-word, built-in word list
- Lets you add up to 1,000 words
- Includes four pop-up keyboards: typewriter, numeric, phone, and time/date
- Recognizes graphics and symmetrical objects

Newton Information Architecture

- Object-oriented database stores, finds, and links information and provides a flexible view of this data
- Newton Toolkit lets you easily create custom applications using its flexible graphical toolbox
- Architecture lets you easily share data across applications

Newton Communications Architecture

- Provides built-in support for serial communications, PC card modems, sending and receiving faxes, and electronic mail
- Provides a single interface for modular, object-oriented communications services
- Provides improved performance with Internet communications applications and multitasking support
- Supports new communications capabilities through its modular design
- Supports Class II Fax

Intelligent Assistance Architecture

- Helps users complete repetitive tasks in multiple categories, including communications, scheduling, finding, and reminding functions
- Contains smart defaults to reduce complexity
- Works in and between applications
- Supports third-party extensions

MessagePad Hardware Architecture

- ARM 610 RISC processor at 20 MHz
- Apple custom system ASIC
- Low-power, transfective LCD display with EL backlight (320 by 240 pixels) 3.8 in. by 2.8 in. (9.6 cm by 7.2 cm)
- Nonglare writing surface
- Telescoping pen
- 8MB of ROM; 2.5MB RAM (1,199K of system RAM; 1,361K of nonvolatile user RAM)
- One PC Card Type II slot with 325 mA capacity
- LocalTalk and RS-232-compatible serial port
- Low-power, half-duplex, infrared transceiver that works at up to 38.4 Kbits/sec within 3.28 ft. (1 m)
- Protective, removable lid

Communications capabilities

=====

- Prints using a variety of serial, parallel, and network printers
- Receives and stores wireless messages using optional messaging cards*
- Communicates via e-mail or taps into on-line services and the Internet with optional wired or wireless modem cards and software
- Provides faxing with optional fax modem (automatic cover-page generation, post-formatting)
- Beams notes, name cards, appointments, and packages at up to 38.4 Kbits/sec within 3.28 ft. (1 m) using high-speed infrared technology
- Automatically dials phone calls with assistance from intelligent auto-dialing (DTMF or modem dialing)*
- Connects to cellular or GSM phones for wireless data and fax communications

*This service may not be available in all countries.

Size and weight

=====

- Length: 8.0 in. (20.32 cm)
- Width: 4.0 in. (10.16 cm)
- Height: 1.2 in. (2.9 cm)
- Weight: 1.0 lb. (0.48 kg) without batteries

Operating environment

=====

- Temperature: 32° to 104° F (0° to 40° C)
- Storage temperature: -4° to 117° F (-20° to 47° C)
- Transit temperature: -4° to 149° F (-20° to 65° C) for up to 72 hours
- Relative humidity: 20% to 90% noncondensing

Power requirements

=====

- Power adapter
 - Universal, 100 to 240 V AC, 50/60 Hz
 - Four plug configurations: U.S., U.K., Europe, and Australia
- Battery type: AA (LR6) alkaline or NiCd Battery Pack
- Lithium cell: DL2032 (3 V nominal)
- Built-in fast charger for optional NiCd Battery Pack
- Power source: four AA alkaline batteries (included), optional power adapter, and optional NiCd Rechargeable Battery Pack

Computer connectivity requirements

=====

- Works with PC-compatible computers with 80386DX or later processors

running Windows version 3.0 or later

- Works with Mac OS-based computers with 68030 or later processors and system software version 7.1 or later

Printer support

=====

- Offers built-in printer support for Apple LaserWriter Plus (and other PostScript-equipped LaserWriter printers), Personal LaserWriter LS, and Personal LaserWriter 300, as well as StyleWriter I and II printers
- Works with most popular PC printers, including the Hewlett-Packard LaserJet II DeskJet 500, Canon BubbleJet 10e, and Epson LQ and FX, using the optional Newton Print Pack

Fax machine support

=====

- Supports Group 3 and Class II Fax machines

Ordering Information

QuickTime for Windows 2.0.3: Removal Instructions (2/96)

Revised: 2/13/96
Security: Everyone

QuickTime for Windows 2.0.3: Removal Instructions (2/96)

Article Created: 13 February 1996

TOPIC -----

This article contains instructions for removing QuickTime for Windows 2.0.3 from your PC-compatible computer.

DISCUSSION -----

Removing QuickTime for Windows 2.0.3

Step 1

Delete the QuickTime for Windows program group in Program Manager.

Step 2

Remove the driver named [MCI] QuickTime for Windows from the Drivers control panel.

Step 3

In WIN.INI, remove the following lines under the section labelled [Extensions]

```
mov=C:\WINDOWS\PLAYER.EXE ^.mov  
pic=C:\WINDOWS\VIEWER.EXE ^.pic
```

Step 4

In WIN.INI, remove the following lines under the section labelled [mci extensions]

```
mov=QTWVideo  
pic=QTWVideo
```

jpg=QTWVideo

Step 5

In WIN.INI, remove the following lines under the section labelled
[embedding]

PlayerFrameClass=QuickTime Movie, QuickTime Movie, c:\windows\player.exe,
picture
ViewerFrameClass=QuickTime Picture, QuickTime Picture, c:\windows\viewer.exe,
picture

Step 6

Delete the following files from the C:\Windows directory:

PLAYENU.DLL
VIEWENU.DLL
PLAYER.EXE
VIEWER.EXE
README.EXE
MCENU.HLP
PLAYENU.HLP
VIEWENU.HLP
CGMINIVW.HLP --> This file does not always exist
QTW.INI
SAMPLE.MOV
*.QTW

Step 7

Delete the following files from the C:\WINDOWS\SYSTEM directory:

MCIQTENU.DLL
QTIMCMGR.DLL
QTIM.DLL
QTOLE.DLL
QTHNDLR.DLL
MCIQTW.DRV
QTNOTIFY.EXE
*.QTC
QTMOVIE.VBX
QTPIC.VBX

AppleVision 1710 Display: Requires Video Signal for Power (1/97)

Revised: 1/28/97
Security: Everyone

AppleVision 1710 Display: Requires Video Signal for Power (1/97)

=====

Article Created: 13 February 1996
Article Reviewed/Updated: 28 January 1997

TOPIC -----

I have had my AppleVision 1710 Display replaced twice already, and neither unit powers on. I have been testing the displays before I connecting them to my Macintosh. Is there something wrong with the AppleVision 1710 Displays?

DISCUSSION -----

Both the AppleVision 1710 Display and the AppleVision 1710AV Display require a video signal before powering on. Since you have not been connecting them to your Macintosh, the power LED hasn't been activated.

To properly test the AppleVision 1710 Display, you need to connect the video cable to your computer, connect the ADB cable from your Macintosh to the display, in order to get resolutions greater than 640x480, and power on your computer and display.

Article Change History:
28 Jan 1997 - Added computer power requirements.

Apple Remote Access MultiPort Server 2.1 Patch: Read Me (2/96)

Revised: 2/14/96
Security: Everyone

Apple Remote Access MultiPort Server 2.1 Patch: Read Me (2/96)

=====

Article Created: 14 February 1996

TOPIC -----

This article contains the ReadMe file for the Apple Remote Access MultiPort Server 2.1 patch.

DISCUSSION -----

Changes in Version 2.1 of the Apple Remote Access MultiPort Server

=====

- MultiPort Server v2.1, unlike unupdated v2.0.1 software, supports ARA 1.0 clients. Customers, however, are encouraged to have ARA 1.0 clients upgrade to the current client software. Future Apple Remote Access products will not support ARA 1.0 clients.
- Previous versions of the MultiPort server did not correctly respond to SNMP queries. This problem has been corrected with v. 2.1.
- When using 28.8 modems, the server would sometimes start resending data needlessly resulting in a dramatic drop in throughput. This problem has been corrected with v. 2.1.
- Computers running System Software version 7.5.1 and 7.5.2 occasionally experienced a crash in the Port Configuration Window in the Remote Access Administration program. This was due to a bug that has been corrected in System Software version 7.5.3 and above. The MultiPort Server Installer adds a system extension to correct this bug even with the earlier systems. The extension does not run if the bug is not present.
- It is normal for some corrupted packets to pass the data integrity checks in the dial-up protocol. With earlier versions of the server, however, corrupted packets caused occasional crashes. This problem has been corrected with v. 2.1.
- Sorting of the network zone lists for networks with a large number of zones

(500 and over) has been significantly speeded up.

- Reliability of the server when using 3rd party security modules has been improved.
- Reliability of the serial drivers for the Apple Serial NB card has been improved.

Installation Instructions

=====

The patch applications on this disk allow you to upgrade ARA MultiPort Server 2.0.1 or 2.0.1 RevB to ARA Multiport Server 2.1. Here is the procedure to follow:

1) Identify which version of the ARA MultiPort Server you have installed. To do so:

1. Open the System Folder.
2. Open the Extensions folder.
3. Click Apple Remote Access MP.
4. Choose Get Info from the File menu.

If the version is ARA MultiPort Server 2.0.1 or 2.0.1 RevB, continue with this procedure. To upgrade an earlier version, obtain the ARA Multiport Server 2.1 Installer diskettes and do a full installation.

2) Choose Restart from the Special menu. After hearing the startup chime, hold down the Shift key. This restarts your Mac OS computer with all system extensions turned off.

3) If you are upgrading from version 2.0.1, open the folder ARA MP 2.0.1->2.1 Patch. If you are upgrading from version 2.0.1 RevB, open the folder ARA MP 2.0.1 RevB->2.1 Patch. The steps to follow are identical for both versions, but you must use the correct patch applications for the upgrade to be successful.

4) Double-click the application icon labeled Part I.

5) Click Patch in the screen that appears.

6) Follow the screen prompts to complete Part I of the upgrade. You will be asked to locate and then patch the following files: Apple Remote Access MP, Call Back Client, Call Back Server, and Link Tool Manager. All of these files should be in the Extensions folder inside the System Folder.

7) Click OK in the dialog box that appears to tell you that Patch I was completed successfully.

8) Double-click the application icon labeled Part II.

9) Click Patch in the screen that appears.

10) Follow the screen prompts to complete Part II of the upgrade. You will be asked to locate and then patch the following files: Modem Link Tool MP, SNB Driver, SNMP Remote Access Agent, and XLT Library. All of these files should be in the Extensions folder inside the System Folder. Finally, you will be asked to locate and patch the Remote Access Manager. This should be in the Remote Access MP Folder, located at the root level of your startup disk.

11) The upgrade is now complete. Restart your Macintosh to use your new software.

Note: Several new modem CCLs are also included on this disk. Simply drag them to the System Folder if you want to use them.

Apple Displays: Type of Phosphor Used (2/96)

Revised: 2/14/96
Security: Everyone

Apple Displays: Type of Phosphor Used (2/96)

Article Created: 14 February 1996

TOPIC -----

What type of phosphor is used in the Multiple Scan 17 Display?

DISCUSSION -----

The type of phosphor that is used in most of Apple's displays is Aluminized P22 Medium-short persistence. This is for both Trinitron and "standard" CRT type displays.

Examples of:

Trinitron Displays - Multiple Scan 17 Display, Multiple Scan 20 Display, AppleVision 1710 Display, AppleVision 1710AV Display.

"Standard CRT" Displays - Multiple Scan 15 Display, Multiple Scan 14 Display, Multiple Scan 1705 Display.

Apple PCI Token Ring Card: Software & Configuration (4/97)

Revised: 4/9/97
Security: Everyone

Apple PCI Token Ring Card: Software & Configuration (4/97)

=====

Article Created: 14 February 1996
Article Reviewed/Updated: 04 April 1997

TOPIC -----

This article describes installing and configuring the software needed for the Apple PCI Token Ring Card.

DISCUSSION -----

Hardware
=====

PCI-Based Power Macintosh Compatibility

The Apple PCI Token Ring Card will work with and is supported by:

Power Macintosh 7200/100 and 7200/120 computers
Power Macintosh 5400 Performa computers
Power Macintosh 7500, 7600, 8500, and 9500 series computers
Workgroup Server 7250
Workgroup Server 8550 series computers

Incompatible With DOS Compatibility Card

At this time, the PCI Token Ring card is not compatible with the PCI DOS Compatibility card. Apple Engineering is investigating this issue.

Software
=====

Installing the Software

This section provides instructions for installing the software in a Macintosh computer. You can also use the Apple PCI Token Ring Card with other network

systems, such as Netware and AIX. Be sure to see the documentation that comes with your computer for details about installing and setting up the card's driver software. To use your Apple PCI Token Ring Card with a Macintosh computer, that computer must have system software version 7.5.3 (or a later version) and at least 8 megabytes (MB) of random-access memory (RAM).

System 7.5.3 Installer

If your computer does not already have system software version 7.5.3 (or a later version) installed, you must install this version before using the PCI Token Ring Card. A CD-ROM containing version 7.5.3 is included with the card.

Step 1

Quit any open applications or desk accessories.

Step 2

Insert the CD-ROM disk in your Macintosh and double-click the disk's icon to open it.

All system software files are compressed. The Installer program will expand them during installation. Do not drag them to your hard disk.

Step 3

Double-click the Install System Software folder to open it.

Step 4

Double-click the Install System Software icon to open it.

Step 5

When you see the Installer's welcome screen, click Continue.

The Easy Install dialog box appears. These instructions cover the Easy Install process, which is suitable for most Macintosh users. If you know exactly which components of system software you want to install, you can use the Custom Install option (by choosing Custom Install from the pop-up menu, then selecting the items you want to install).

Step 6

Make sure the destination disk indicated on the screen is the one on which you want to install system software.

If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.

Step 7

Click Install.

The Installer updates the software in the System Folder on your hard disk.

Step 8

Follow the instructions on the screen.

On-screen messages report the installation status. The installation procedure

may take several minutes.

Step 9

When installation is complete, restart your computer.

If for some reason the procedure was not successful, try the procedure again.

Token Ring Driver Installer

To install the card's Token Ring driver software on your Macintosh computer, you need to use the Installer program on the Network Driver Installer disk, included with your card. For safety, make sure the Installer disk is locked before you use it. To lock a disk, slide the tab on the back side so that the square hole is open. Keep the installer disk after installation in case you need to reinstall Token Ring software some time in the future. To install the driver software:

Step 1

Insert the Network Driver Installer disk in your Macintosh and double-click the disk's icon to open it.

Step 2

Open the Installer program, review the welcome screen, and click Continue.

The Easy Install dialog box appears.

Step 3

Make sure that the disk indicated on the Installer's dialog box is your current startup disk, and click Install.

If you see a message indicating that the software cannot be installed while other programs are running, click Continue.

Step 4

When you see a message reporting that the installation was successful, click Restart.

Before you can use services on a Token Ring network, you need to select the Token Ring network connection for your startup disk. Move ahead to the Configuration section of for more information.

Configuration

=====

Configuring the System for Token Ring In this section, we will cover the steps necessary to configure your Macintosh computer's network connections for use with your newly installed PCI Token Ring Card, System 7.5.3, and the Token Ring software.

AppleTalk Setup

A Macintosh computer's network connection is preset for LocalTalk connected to

the printer port. To connect to a Token Ring network using AppleTalk, you need to change the settings in the AppleTalk control panel. Follow these steps:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Double-click the AppleTalk control panel to open it.

Step 3

Choose Token Ring from the popup menu.

If you have more than one card, choose the one you want to use for an AppleTalk connection. If you see a message that an error occurred, click OK and make sure that your computer is connected to the Token Ring network.

Step 4

Click Save to save the changes you made in the AppleTalk connection.

Step 5

If you see a pop-up menu that lists zones, select the zone you want, then click OK.

If your network has been set up to allow you to choose a zone but you have not yet done so, the menu lists choices, with your designated zone selected. The zone you select determines the default location for any network services provided by your computer and listed in the Chooser (such as file sharing). Before you select a zone different from the one already highlighted, consult your network administrator.

Step 6

Close the AppleTalk control panel.

Step 7

Check that the LED light on the card, above the Token Ring port, is working properly.

You are now ready to use AppleTalk services available on your Token Ring network.

TCP/IP Setup

To connect to a Token Ring network using TCP/IP, you need to change the setting in the TCP/IP control panel. Follow these steps:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Double-click the TCP/IP control panel to open it.

Step 3

Choose Token Ring from the popup menu.

If you have more than one card, choose the one you want to use with TCP/IP. If you see a message that an error occurred, click OK and make sure that your computer is connected to the Token Ring network.

Step 4

Configure the remaining options in the control panel and check with the network administrator if there are any questions.

Step 5

Click Save to save the changes you made in the TCP/IP connection.

Step 6

Close the TCP/IP control panel.

Step 7

Check that the LED light on the card, above the Token Ring port, is working properly.

You are now ready to use TCP/IP services, such as MacIP, on your Token Ring network.

Article Change History:

04 Apr 1997 - Added step to TCP/IP setup section.
14 May 1996 - Updated with hardware compat info.
17 Apr 1996 - Changed distribution status.
19 Feb 1996 - Changed distribution status.

MAE, Solaris 2.3 or Later: PC, UNIX Floppy Do Not Work (5/96)

Revised: 5/14/96
Security: Everyone

MAE, Solaris 2.3 or Later: PC, UNIX Floppy Do Not Work (5/96)

Article Created: 14 February 1996
Article Reviewed/Updated: 14 May 1996

TOPIC -----

On my SPARCStation with Solaris 2.3 and Patch 101318-75, prior to installing the Macintosh Application Environment (MAE), I could insert PC or UNIX floppy disks and the File Manager appears when checking for the floppy. Macintosh floppy disks were not acknowledged by the Volume Manager.

After installing MAE, however, the File Manager no longer launches for my PC and UNIX floppy disks, but it will now, for Macintosh floppy disks. How can I have all of these floppy disks available to File Manager?

DISCUSSION -----

This issue may occur on all version of Solaris 2.3, 2.4, and 2.5, however, it is not always manifested. If this issue occurs, below is the solution.

MAE initially required JumboKernel Patch 101318-59. Sun's new release affects the Volume Manager. The volume manager uses /etc/rmmount.conf to handle removable media, and then feeds it back to vold.conf. Depending on the location of the entry for macfs, the Volume Manager will ignore PC/UNIX floppy disks.

Examples of Solaris 2.3 or later /etc/rmmount.conf:

This one will NOT work

```
-----
sparc10% cat /etc/rmmount.conf
# @(#)rmmount.conf 1.2      92/09/23 SMI
#
# Removable Media Mounter configuration file.
#
# File system identification
ident hsfs ident_hsfs.so cdrom
```

```
ident ufs ident_ufs.so cdrom floppy
ident pcfs ident_pcfs.so floppy
ident macfs ident_macfs.so floppy

# Actions
action floppy action_macfs.so    <- Notice this is the MAE entry
action cdrom action_filemgr.so
action floppy action_filemgr.so
```

This one WILL work

```
-----
sparc10% cat /etc/rmmount.conf
# @(#)rmmount.conf 1.2      92/09/23 SMI
#
# Removable Media Mounter configuration file.
#
# Modified by MH
#

# File system identification
ident hsfs ident_hsfs.so cdrom
ident ufs ident_ufs.so cdrom floppy
ident pcfs ident_pcfs.so floppy
ident macfs ident_macfs.so floppy

# Actions
action cdrom action_filemgr.so
action floppy action_filemgr.so
action floppy action_macfs.so    <- New Location
EOF
```

NOTE: With the new location of the action_macfs.so entry, both PC/UNIX floppies and Macintosh floppy disks will work properly.

DOS Compatibility Card: Color Printing on CLW 12/600 PS (9/96)

Revised: 9/18/96
Security: Everyone

DOS Compatibility Card: Color Printing on CLW 12/600 PS (9/96)

=====

Article Created: 15 February 1996
Article Reviewed/Updated: 17 September 1996

TOPIC -----

I have a DOS Compatibility Card in my Power Macintosh computer, and I want to print on a Color LaserWriter 12/600 PS printer. How do I configure my DOS/Windows software to print on the Color LaserWriter 12/600 PS printer?

DISCUSSION -----

In the Mac OS, you need to use the LaserWriter 8.3 or later printer software for the Color LaserWriter 12/600 PS printer. Earlier releases of LaserWriter driver (7.x or 8.2 and earlier) print, but do not provide the correct PPD, and do not use ColorSync 2.x for color calibration.

If you have a PCI-based Power Macintosh, should use the LaserWriter 8.3.4 or 8.4 software.

For detailed information on LaserWriter drivers and Mac OS, see the Tech Info Library article titled "LW Driver and System SW: Recommended Combinations".

DOS Compatability Software

You need to use PC Compatability 1.5 or later. Previous version of PC Print Spooler had trouble spooling PostScript jobs generated in the Windows environment.

MS-DOS

DOS applications must have individual support for PostScript. Due to the age of most DOS applications, color support for PostScript printing is unlikely to be available for most applicatons

Microsoft Windows 3.1

Color LaserWriter 12/600 PS customers were provided a PostScript LaserWriter driver for MS-Windows. This driver has support for color printing. The most recent version of the driver is 3.0.6. You must also turn off Send Data in Binary. If you do not turn this option off, the PostScript code generates some characters at the beginning of the file that the PC Print Spooler cannot handle properly.

Microsoft Windows 95

Color LaserWriter 12/600 PS customers were provided a PostScript LaserWriter driver for Windows 95. This driver has support for color printing. The most recent version of the driver is 4.1. Once installed, the following changes need to be made in the printer driver Properties window:

- 1) Select 'disable bi-directional support for this printer' under Details:Spool Settings
- 2) Under Details:Port Settings, make sure the checkbox labeled 'Check port state before printing' is not checked
- 3) Under Postscript:Advanced', make sure the Send CTRL+D before job' and 'Send CTRL+D after job' checkboxes are not checked.

CLW 12/600 PS: Changing Configuration w/ DOS Compat Card (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Changing Configuration w/ DOS Compat Card (10/96)

Article Created: 15 February 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

I am trying to change the configuration of Color LaserWriter 12/600 PS printer from the DOS Compatibility Card to "Send Data In Binary". However, I get an error message that there is not enough memory to do perform this operation. I have a 16MB SIMM installed with 614K free of conventional memory. My Windows resources are 85% free according to the Program Manager. What is going on?

DISCUSSION -----

When setting up the Color LaserWriter 12/600 PS or the Color LaserWriter 12/660 PS printer to print from MS-DOS the printer is connected using LPT1.DOS. With this configuration the drivers for the Color LaserWriter 12/600 PS will not let you change the PostScript settings for the printer. To resolve this issue connect the printer to LPT1, make the appropriate changes in the PostScript section of the drivers setup. Then go back and change the connection settings to LPT1.DOS.

Article Change History:
23 Oct 1996 - Added Color LaserWriter 12/660 PS to discussion.
01 Apr 1996 - Minor typographical errors corrected.

PowerBook 150: Printing Issue with German 7.5 Mac OS (3/96)

Revised: 3/28/96
Security: Everyone

PowerBook 150: Printing Issue with German 7.5 Mac OS (3/96)

=====

Article Created: 15 February 1996
Article Reviewed/Updated: 28 March 1996

TOPIC -----

I am having problems printing to a StyleWriter II printer from my PowerBook 150. The PowerBook 150 has a German localized version of System 7.5 installed on it. When I try printing a file I get this error message:

"Es ist ein Fehler im Drucker aufgetreten. Überprüfen Sie Bitte, ob der Drucker korrekt angeschlossen ist. Starten Sie anschließend den Druckvorgang errent."

If I put a German localized version of System 7.1.1 on the PowerBook it works properly. Is there something wrong with the German Localized version of System 7.5?

DISCUSSION -----

This issue is related to the localized version of the StyleWriter II driver v1.2 included with the German System 7.5 software.

In order to print using a PowerBook 150 and the German version of System 7.5, you need to use the StyleWriter 1200 v2.1.1 printer driver.

NOTE:

This issue would most likely occur on other Macintosh computers as well.

Since the German localized StyleWriter 1200 v2.1.1 printer driver is backward compatible and included with the German System 7.5 software, you can and should use this printer driver.

Power Macintosh 7200/7500/8500/9500:Hard Drive Test Fails (2/96)

Revised: 2/15/96
Security: Everyone

Power Macintosh 7200/7500/8500/9500:Hard Drive Test Fails (2/96)

=====

Article Created: 15 February 1996

TOPIC -----

When I run hard drive diagnostics on a Power Macintosh 7200, 7500, 8500 or 9500 series computer using utilities such as SilverLining, FWB Hard Disk Toolkit, or MacTest Pro, the drives always seem to fail the tests after the computer has been on for 30 minutes or more. The hard drives seem to be working fine otherwise. What can I be doing wrong?

DISCUSSION -----

It is likely that the Energy Saver software is making the drive spin-down during the testing, which causes the diagnostics to fail the drive. To avoid this, in the Energy Saver control panel, set the Sleep Setup option to "Never". This will prevent the software from spinning down the drive and allow the utility software to properly check the hard drive.

PowerBook 500 & 200 Series: PPC Upgrade Issues (1/97)

Revised: 1/10/97
Security: Everyone

PowerBook 500 & 200 Series: PPC Upgrade Issues (1/97)

Article Created: 15 February 1996
Article Reviewed/Updated: 10 January 1997

TOPIC -----

I have been experiencing some difficulties when upgrading customers' Macintosh PowerBook 500 or 200 series computers with the PowerPC (PPC) Upgrade:

- 1) Why does the internal Global Village PowerPort Mercury no longer function after the PPC daughter board or logic board upgrade is installed?
- 2) My PowerBook 500 series computer freezes up when the PCMCIA card cage is installed in the left expansion bay. Why?
- 3) I recently upgraded my PowerBook computer to PowerPC. Since the upgrade, the hard drive will not spin down, even though the icon in the Control Strip indicates that it has spun down. The only time the hard drive will spin down is when the PowerBook is shutdown or sleeping. What's wrong?

DISCUSSION -----

1) Question: Why does the internal Global Village PowerPort Mercury no longer function after the PPC daughter board or logic board upgrade is installed?

Answer: The Global Village PowerPort Mercury modem will not function without the latest software update from Global Village Communications, Inc. Global Village has now released the software. Version 2.5.5 is needed for the internal modem in the PowerBook 500 series to work. Customers will need to contact Global Village for more information.

2) Question: My PowerBook 500 series computer freezes up when the PCMCIA card cage is installed in the left expansion bay. Why?

Answer: The PowerBook 500 series PPC upgrade card requires the Revision C PCMCIA card cage. After the PPC upgrade card has been installed, the computer will not

startup if either of the prior revisions of the PCMCIA expansion card cage is inserted in the expansion bay. The Revision C cage is not yet available. It is expected it to be available from Apple by the end of May 1996

3) Question: I recently upgraded my PowerBook computer to PowerPC. Since the upgrade, the hard drive will not spin down, even though the icon in the Control Strip indicates that it has spun down. The only time the hard drive will spin down is when the PowerBook is shutdown or sleeping. What's wrong?

Answer: To alleviate this symptom, you need to update the hard drive driver with Drive Setup 1.0.3 or later. Since the default hard disk driver for all PowerBook 200 and 500 series computers comes from Apple HD SC Setup, any such PowerBook upgraded to PowerPC will have this symptom unless the hard drive has been previously updated with Drive Setup 1.0.3 or later.

Article Change History:

10 Jan 1997 - Added info about hard disk spinning resolution.

24 Jun 1996 - Correct typographical error.

10 May 1996 - Updated first two items and added third.

DISCUSSION -----

Issue

There is a known issue with the password security feature on the PowerBook 5300 and 190 series computers. If you open the Password Security control panel and set the password security is turned on and is set for ask password on wake, the unit will not sleep.

Workaround

One workaround is to turn off the "ask for password on wake" feature. If this is done, the PowerBook will be able to sleep.

Resolution

This issue is resolved by installing the System 7.5 Update 2.0 which includes the Password Security 1.0.3 control panel.

Article Change History:

05 Sep 1996 - Reworded for clarity.
18 Mar 1996 - Added information about resolution.

AppleCD Drives: Troubleshooting Sound Related Issues (2/96)

Revised: 2/15/96
Security: Everyone

AppleCD Drives: Troubleshooting Sound Related Issues (2/96)

Article Created: 15 February 1996

TOPIC -----

When I play Audio Compact Discs on my Power Macintosh 7500 or Power Macintosh 8500 using system 7.5.2, I do not get any sound from my computer. The counter in the AppleCD Audio Player is counting down as though it is playing. My system sounds, startup chime, and computer compact discs work just properly. What is happening?

DISCUSSION -----

Follow the troubleshooting procedures below to get the problem resolved. After each section, test to see if sound is working for Audio Compact Discs.

Set Sound and Display Settings
=====

Make sure your Sound and Display settings are set appropriately

Step 1

Open Sound and Displays control panel

Step 2

Select Internal CD under the Sound Input section

Step 3

Select Computer Speaker under the Sound Output section - even if you have external speakers connected.

NOTE:

Step 3 is a troubleshooting step to verify sound is working appropriately.

Remove Preferences

=====

You need to Delete the following preferences from your Preference folder, which is located in your System folder.

- Finder Preferences
- Sound and Displays folder in the Preference folder
- Sound Preferences

NOTE:

You will not be able to empty the Trash until after you restart your Macintosh.

Enable Only System 7.5.2 Extensions

=====

Test with just 7.5.2 extensions enabled. Use the Extensions Manager control panel to turn off all but System 7.5.2 extensions

Reset PRAM

=====

Reset (clear) Parameter RAM (PRAM).

Step 1

Restart your Macintosh

Step 2

As your Macintosh begins the startup process, hold down the Option-Command-p-r keys until you hear at least two startup chimes.

Remove All External Devices

=====

Disconnect all externally connected devices other than the monitor and the keyboard

Remove and Reinstall Software

=====

Delete and reinstall the software involved.

The following files need to be removed:

- AppleCD Audio Player - Apple Menu Items folder
- Sound and Displays Control Panel - Control Panel folder

- AppleScript - Extensions folder
- Apple CD-ROM - Extensions folder
- Audio CD Access - Extensions folder
- Foreign File Access - Extensions folder
- High Sierra File Access - Extensions folder
- ISO 9660 File Access - Extensions folder

Reinstall Software

Choose custom install from the Apple Macintosh CD system software installer (startup from the System CD by holding down the "c" key. Immediately after restart, with the Apple Macintosh CD in the CD ROM drive)

Select the following items from the list given (you need to click on the white arrow to the left of the sections to select the specific items).

- AppleScript - Utility Software section
- CD-ROM - Multimedia Software section
- Sound and Displays - Control Panels section

Check Audio Cable

=====

If you had extra RAM or PCI cards installed in your Macintosh, check the CD-ROM drive's audio cable. The cable may not have been reattached properly.

To avoid damaging your computer, Apple Computer recommends that you have an authorized Apple service provider check and/or reattach the audio cable.

Remove additional RAM and PCI cards

=====

Remove any additional RAM or PCI cards that were installed in your Macintosh.

To avoid damaging your computer, Apple Computer recommends having RAM and PCI cards removed by an authorized Apple service provider.

Network Server 500 and 700: Technical Specifications (7/96)

Article Created: 16 February 1996
Article Reviewed/Updated: 29 July 1996

TOPIC -----

This article provides the technical specifications for the Network Server 500 and Network Server 700.

DISCUSSION -----

Microprocessor

Network Server 500

- PowerPC 604 RISC microprocessor running at 132 MHz, located on upgradable, replaceable CPU card
- Integrated floating-point unit and 32K level 1 cache memory
- 512K level 2 cache memory

Network Server 700

- PowerPC 604 RISC microprocessor running at 150 MHz, located on upgradable, replaceable CPU card
- Integrated floating-point unit and 32K level 1 cache memory
- 1MB level 2 cache memory

Memory

Network Server 500

- 32MB of error-detecting parity DRAM
- Can be expanded to up to 512MB of DRAM
- 8 slots for 168-pin, 72-bit, 60ns DIMMs
- DIMM operating range is 5 volts

Network Server 700

- 48MB or 32MB of error-detecting parity DRAM
- Can be expanded to up to 512MB of DRAM
- 8 slots for 168-pin, 72-bit, 60ns DIMMs

- DIMM operating range is 5 volts

Storage

Network Server 500

- Supports seven internal SCSI devices
- One AppleCD 600i CD-ROM drive (up to 600KB/sec data-transfer rate) standard on all configurations
- One DDS-2 DAT drive (4GB uncompressed, up to 12GB compressed); some configurations
- One Apple SuperDrive 1.44MB floppy disk drive

Network Server 700

- Supports nine internal SCSI devices including two fixed-mount half-height drives
- One AppleCD 600i CD-ROM drive (up to 600KB/sec data-transfer rate) standard on all configurations
- One DDS-2 DAT drive (4GB uncompressed, up to 12GB compressed); some configurations
- One Apple SuperDrive 1.44MB floppy disk drive

Software

****IMPORTANT NOTE****

With the purchase of any Network Server 500 or Network Server 700, you must purchase the AIX for Apple Network Servers Accessory Kit (M4525Z/A) to obtain AIX for Apple Network Servers version 4.1.4. AIX is not pre-installed on Network Servers.

Network Server 500

- AIX for Apple Network Servers version 4.1.4
- Trial versions of IPT uShare and CanOPI; Helios EtherShare, EtherShare OPI and PCShare; and Legato Networker

Network Server 700

- AIX for Apple Network Servers version 4.1.4
- Trial versions of IPT uShare and CanOPI; Helios EtherShare, EtherShare OPI and PCShare; and Legato Networker

Networking

Network Server 500

- Built-in Ethernet
- Two serial ports
- Supports AppleTalk and TCP/IP networking software

Network Server 700

- Built-in Ethernet
- Two serial ports
- Supports AppleTalk and TCP/IP networking software

Displays

Network Server 500

- LCD status display for system monitoring
- Supports up to 20-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Network Server 700

- LCD status display for system monitoring
- Supports up to 20-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Display support

Network Server 500

- Built-in 1MB VRAM
- Resolutions:
 - 1024 pixels by 768 pixels
 - 800 pixels by 600 pixels
 - 640 pixels by 480 pixels

Network Server 700

- Built-in 1MB VRAM
- Resolutions:
 - 1024 pixels by 768 pixels
 - 800 pixels by 600 pixels
 - 640 pixels by 480 pixels

Interfaces

Network Server 500

- Six PCI expansion slots
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- AAUI-15 Ethernet connector (requires adapter)
- Two DMA DIN-8 serial ports (RS-232/RS-422)
- Two Fast/Wide SCSI-2 channels support 7 internal devices
- Supports 56 external devices using optional PCI RAID cards
- SCSI-1 channel supports up to 7 external devices (compatible with SCSI-1 devices)
- 16-bit stereo sound input and output ports
- Standard three-row DB-15 video port for display support (Macintosh Display Adapter included)

Network Server 700

- Six PCI expansion slots
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- AAUI-15 Ethernet connector (requires adapter)
- Two DMA DIN-8 serial ports (RS-232/RS-422)
- Two Fast/Wide SCSI-2 channels support 9 internal devices
- Supports 56 external devices using optional PCI RAID cards
- SCSI-1 channel supports up to 7 external devices (compatible with SCSI-1 devices)
- 16-bit stereo sound input and output ports

- Standard three-row DB-15 video port for display support (Macintosh Display Adapter included)

Enclosure

Network Server 500

- Front and back key-controlled access to all components, including:
 - Three-position translucent locking front door that offers three levels of access: The first level allows full access to seven front SCSI drives and media such as CD-ROMs and tape cartridges. The second level allows removable media access for replacement of floppy disks, tape cartridges and CD-ROMs, but prohibits removal of storage drives and power supplies. The third level locks the access door closed, and prohibits access to storage drives, removable media, and power supplies.
 - Keylock rear slide-out cabinet access to logic board, processor card, DIMM sockets, and PCI slots (keylock powers down system when unlocked)
 - Keylock rear cabinet door
- Seven tray-mount SCSI drive bays with hot-swap option
- Locking wheels
- Dual hot-swappable fans
- Speaker
- Security slot (requires a third-party accessory)
- Power cord lock
- Optional 19-inch rack-mount kit

Network Server 700

- Front and back key-controlled access to all components, including:
 - Three-position translucent locking front bay door that offers three levels of access: The first level allows full access to seven front SCSI drives and media such as CD-ROMs and tape cartridges, as well as the power supplies. The second level allows removable media access for replacement of floppy disks, tape cartridges and CD-ROMs, but prohibits removal of storage drives and power supplies. The third level, locks the access door closed, and prohibits access to storage drives, removable media, and power supplies.
 - Keylock rear slide-out cabinet access to logic board, processor card, DIMM sockets, and PCI slots (keylock powers down system when unlocked)
 - Keylock rear cabinet door for access to two fixed-mount drive bays
- Seven tray-mount SCSI drive bays with hot-swap option
- Optional hot swappable power supplies
- Locking wheels
- Dual hot-swappable fans
- Speaker
- Security slot (requires a third-party accessory)
- Power cord lock
- Optional 19-inch rack-mount kit

Drive bays

Network Server 500

- Front bays support seven half-height or three full-height (5.25-inch) tray-mounted SCSI devices, and electronically configure SCSI IDs

dependent on bay location

- Top four bays share one (20MB/sec) Fast/Wide SCSI-2 channel
- Bottom three bays share a second (20MB/sec) Fast/Wide SCSI-2 channel

Network Server 700

- Front bays support seven half-height or three full-height (5.25-inch) tray-mounted SCSI devices, and electronically configure SCSI IDs dependent on bay location
- Top four front bays share one (20MB/sec) Fast/Wide SCSI-2 channel
- Bottom three front bays share a second (20MB/sec) Fast/Wide SCSI-2 channel
- Two rear fixed-mount bays share the same Fast/Wide SCSI-2 channel (along with the bottom three front bays) and support two half-height or one full-height (5.25-inch) devices

System administration

Network Server 500

- Supports administration at console with AIX system administration tools
- Supports remote administration from a networked Mac OS, Windows, or UNIX-based computer

Network Server 700

- Supports administration at console with AIX system administration tools
- Supports remote administration from a networked Mac OS, Windows, or UNIX-based computer

Keyboard and mouse

Network Server 500

- Supports ADB keyboards with numeric keypads
- Includes ADB Mouse II

Network Server 700

- Supports ADB keyboards with numeric keypads
- Includes ADB Mouse II

Clock/calendar

Network Server 500

- Custom integrated circuit with long-life lithium battery

Network Server 700

- Custom integrated circuit with long-life lithium battery

Electrical requirements

Network Server 500

- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 325W maximum for power supply (not including monitor)

Network Server 700

- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 425 Watt maximum for both main and optional, load-balanced, redundant power supply (not including monitor)

PCI power requirements

Network Server 500

- Maximum current draw for all PCI cards: 50W

Network Server 700

- Maximum current draw for all PCI cards: 90W

ADB power requirements

Network Server 500

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Network Server 700

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Environmental requirements

Network Server 500

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116.6° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 0 to 10,000 ft. (0 to 3,048 m)

Network Server 700

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116.6° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 0 to 10,000 ft. (0 to 3,048 m)

Size and weight

Network Server 500

- Height: 24.5 in. (62.2 cm)
- Width: 16.5 in. (41.9 cm)
- Depth: 18 in. (45.7 cm)
- Weight: 84 to 92 lb. (38 to 41 kg) -- varies based on internal devices installed

Network Server 700

- Height: 24.5 in. (62.2 cm)
- Width: 16.5 in. (41.9 cm)
- Depth: 18 in. (45.7 cm)
- Weight: 84 to 92 lb. (38 to 41 kg) -- varies based on internal devices installed

Regulatory approval

Network Server 500

- FCC Class A
- CE
- VCCI

Network Server 700

- FCC Class A
- CE
- VCCI

Network Server 500 & 700: DRAM Configurations (3/96)

Revised: 3/22/96
Security: Everyone

Network Server 500 & 700: DRAM Configurations (3/96)

Article Created: 15 February 1996
Article Reviewed/Updated: 22 March 1996

TOPIC -----

This article describes DRAM configurations, both parity and nonparity, for the Network Server 500 and 700 computers.

DISCUSSION -----

DRAM is provided in packages called Dual Inline Memory Modules, or DIMMs.

Your server can work with any of several DRAM configurations, depending on the density of the DRAM chips that are mounted on the DIMMs. The 168-pin parity DIMMs used in the Network Server are available from Apple in sizes of 8, 16, and 32 MB pairs, enabling you to increase Network Server memory by 16, 32, and 64 MB, respectively. Your server can have a maximum of 512 MB of memory. The DIMM operating range is 5 volts.

The Network Server 500 and 700 do not have any DRAM installed on the logic board. There exists 8 DIMM slots, where memory should be added in pairs. The maximum amount of memory that each server can hold is 512MB of RAM, obtained by placing 64MB DIMMs in all 8 DIMM slots.

IMPORTANT: The DIMMs should be 72-bit-wide 168-pin fast-paged mode, 60-nanosecond (ns) RAM access time or faster. DRAM must support byte writes. SIMMs and some DIMMs from older Macintosh computers will not work in the Network Server. The parity DIMMs should be installed in matched pairs (for example, two 16 MB DIMMs, one in slot 1A, the other in slot 1B).

Nonparity DRAM with 70-nanosecond DRAM access time or faster will work; however, if there is any nonparity DRAM installed, all server parity checking is disabled. Consult an Apple-authorized dealer or service provider for information and upgrades.

Parity DIMMs should be added in pairs, however it is not necessary. If they are

added in pairs, 144 bit wide data path is gained by interleaving the parity DIMMs.

The Network Server 700 comes in two configurations, a 32 or 48 MB configuration.

These configurations can be obtained in three ways based on the memory simm chip inventory available at the time of build. Unfortunately we can not predict or guarantee which configuration a customer will receive.

32MB: 1 32 MB parity DIMMs.
2 16 MB parity DIMMs.
4 8 MB parity DIMMs.

48MB: 1 32MB parity DIMM, and 1 16MB parity DIMM
2 16MB parity DIMMs, and 2 8MB parity DIMMS
3 16MB parity DIMMs

Article Change History:

22 Mar 1996 - Added information about configuration and DIMMs.

26 Feb 1996 - Changed distribution status.

Network Server 500 and 700: Product Description (8/96)

Revised: 8/1/96
Security: Everyone

Network Server 500 and 700: Product Description (8/96)

=====

Article Created: 16 February 1996
Article Reviewed/Updated: 1 August 1996

TOPIC -----

This article describes the Network Server 500 and Network Server 700.

DISCUSSION -----

The Network Server 500 and 700 are Apple's fastest, most powerful, reliable, and expandable server solutions for demanding network file, print, and database users.

The Network Server 500 and 700 high-performance servers are based on the 132-megahertz and 150-megahertz PowerPC 604 RISC processors, respectively, and both run the robust AIX for Apple Network Servers operating system.

Designed from the lockable wheels up as highly available, reliable, and secure servers, both Network Servers offer optional hot-swappable redundant tray-mounted hard drives (requires PCI RAID Disk Array Card and RAID level 5) that slide in and out of the front storage bays in seconds. These bays provide outstanding storage flexibility because they can hold tray-mounted optical drives, tape drives, and hard drives in full- or half-height configurations.

They're easy to network, with built-in Ethernet support and optional support for up to seven Ethernet segments using PCI expansion cards.

The Network Server 700 also offers optional hot-swappable redundant power supplies that slide in and out in a similar manner to the front storage bays.

Network Servers are designed around industry standards. From AIX to PCI to SCSI, they're built to fit into your multiplatform network environment. And each features a built-in quad-speed CD-ROM drive for installing software or serving information to networked desktop computer users.

In addition, they're designed to be easy to reconfigure and service: Each major

component can be replaced in less than 60 seconds -- including the logic board.

Logic boards on both servers can be easily upgraded to 512 megabytes of DRAM main memory, and their PowerPC microprocessors are located on upgradable, replaceable processor cards.

Network Servers are easy to expand, with six PCI expansion slots, and up to 256 gigabytes of total storage capacity.

The Network Server enclosures offer controlled, key lockable access to front-mounted hard disk drives, CD-ROM drives, tape drives, and other media.

The most powerful servers Apple has ever built, the industrial strength Network Servers will meet the needs of the most demanding publishing, education, and technical customers.

Features

=====

Performance

- 150-MHz PowerPC 604 RISC processor with floating-point unit and 32K on-chip cache on an upgradable, replaceable processor card (700 model)
- 132-MHz PowerPC 604 RISC processor with floating-point unit and 32K on-chip cache on an upgradable, replaceable processor card (500 model)
- Two PCI buses
- Two 20-megabyte-per-second Fast/Wide SCSI channels

Reliability and high availability

- Optional redundant hot-swappable disk drives (requires PCI RAID Disk Array Card and RAID level 5)
- Optional redundant hot-swappable power supplies (700 model)
- Parity memory protection
- Third-party uninterruptable power supply (battery backup)

Expansion and storage

- 32MB or 48MB of main memory, expandable to 512MB
- Six PCI slots for expansion cards
- Up to six internal tray-mount hard disk drives of up to 4GB each, with hot-swap and redundancy option (requires PCI RAID Disk Array Card and RAID level 5), expandable to up to 256GB
- Two internal fixed-mount disk drives (700 model)
- Internal quadruple-speed CD-ROM drive
- Internal DDS-2 digital audiotape (DAT) drive (some configurations)
- SCSI-1 bus supports up to seven devices
- Eight ports support a wide range of peripherals

Networking

- Built-in AAUI Ethernet connector

..TIL19362-Network_Server_500_and_700-Product_Description_8-96.pdf

- Support for AppleTalk and TCP/IP networking protocols
- Two serial ports

Enclosure

- Three key-controlled access levels for tray-mount front drive bays
- Key-controlled access to power supplies
- Key-controlled slide-out module for access to main logic board, processor card, PCI slots and memory sockets
- Key-controlled rear access to two fixed-mount half-height drives (700 model)
- Locking wheels
- Dual hot-swappable fans
- Optional 19-inch rack-mount kit

Compatibility

- Binary compatible with the thousands of AIX applications

Bundled software

- Trial versions of IPT uShare and CanOPI; Helios EtherShare, EtherShare OPI and PCShare; and Legato Networker

Service and support

- Includes 1-year on-site hardware warranty with second-business-day response
- Includes lifetime 24-hour telephone hardware troubleshooting
- Includes 90 days of 24-hour telephone software support
- Offers optional next-business-day on-site service response plan
- Offers optional 7-day, 24-hour telephone support plan and priority queuing

=====

ORDERING INFORMATION

=====

IMPORTANT NOTE

With the purchase of any Network Server 500 or Network Server 700, you must purchase the AIX for Apple Network Servers Accessory Kit (M4525Z/A)* to obtain AIX for Apple Network Servers version 4.1.4. AIX is not pre-installed on Network Servers.

Network Server 700/150 (48MB/4.3GB/CD/DAT)

Order No. M3470LL/A

- Network Server 700 with 48MB of parity DRAM, 1MB level 2 cache, 4.3GB Fast/Wide SCSI disk drive, internal quadruple-speed CD-ROM drive, DDS-2 DAT drive, and 1.4MB Apple SuperDrive floppy disk drive
- Limited one-year hardware warranty

Optional Network Server 700 configuration

..TIL19362-Network_Server_500_and_700-Product_Description_8-96.pdf

Network Server 700/150 (32MB/CD/1GB)

Order No. M3471LL/A

- Network Server 700 with 32MB of parity DRAM, 1MB level 2 cache, 1GB SCSI disk drive, internal quadruple-speed CD-ROM drive, and 1.4MB Apple SuperDrive floppy disk drive
- Limited one-year hardware warranty

Network Server 500/132 (32MB/2.1GB/CD/DAT)

Order No. M3468LL/A

- Network Server 500 with 32MB of parity DRAM, 512K level 2 cache, 2.1GB Fast/Wide SCSI disk drive, internal quadruple-speed CD-ROM drive, DDS-2 DAT drive, and 1.4MB Apple SuperDrive floppy disk drive
- Limited one-year hardware warranty

Optional Network Server 500 configuration

Network Server 500/132 (32MB/CD)

Order No. M3469LL/A

- Network Server 500 with 32MB of parity DRAM, 512K level 2 cache, quadruple-speed CD-ROM drive, and 1.4MB Apple SuperDrive floppy disk drive
- Limited one-year hardware warranty

AIX for Apple Network Server Accessory Kit*

Order No. M4525Z/A

- Includes installation CD, Mac OS Utilities for the Network Server with AIX, Diagnostics Diskette, Setting Up the Network Server Manual, Using AIX Manual, AppleTalk Services, Mac OS Utilities, Quick Reference Card, Power Cord, Power Cord Lock, VGA Adapter, ADB Mouse, DAT Tape Cleaner, Try and Buy Third Party Software including IPT: uShare, CanOPI; Helios: EtherShare, EtherShare OPI, PCShare; Legato Systems: Legato Data Backup Utility, Networker Macintosh ClientPak, Networker Eval, APC: Powerchute.

=====
Peripherals and Accessories
=====

Accessory Kit

=====

AIX for Apple Network Servers Accessory Kit

Order No. M4525LL/A

The AIX for Apple Network Servers Accessory Kit includes the following items:

CD-ROM Discs

- AIX for Apple Network Servers version 4.1.4 CD
- PowerChute Plus CD, requires APC Corporation's UPS purchased separately
- Helios EtherShare, OPI, PCShare, demo license to June 1, 1996
- Information Presentation Technologies (IPT) uShare, CanOPI, free 90 day trial with a fax key authorization

..TIL19362-Network_Server_500_and_700-Product_Description_8-96.pdf

- Legato Data Backup Utility for server only, fully licensed
- Legato Networker for clients, 10 client license for 75 days

Floppy Disks

- Mac OS Utilities for the Network Server with AIX
- Network Server Diagnostic Utility

Other Items *

- Quick Reference Card
- Setting Up the Network Server manual
- Using AIX, AppleTalk Services, and Mac OS Utilities on the Apple Network Server
- flyer for Logitech 3-button mouse options
- support credit card
- mouse
- power cord
- power cord locking mechanism and screws
- cleaning cassette
- VGA Adapter

* Note: No data backup tape is included.

Memory Expansion Kits

=====

Network Server 16MB Parity Memory Kit (Two 8MB 60ns DIMMs)
Order No. M4017LL/A

Network Server 32MB Parity Memory Kit (Two 16MB 60ns DIMMs)
Order No. M4018LL/A

Network Server 64MB Parity Memory Kit (Two 32MB 60ns DIMMs)
Order No. M4019LL/A

Hard Drives

=====

Network Server 2.1GB F/W SCSI Hard Drive in Removable Tray
Order No. M4022LL/A

Network Server 4.3GB F/W SCSI Hard Drive in Removable Tray
Order No. M4023LL/A

Network Server 700 2.1GB Fixed Hard Drive with Bracket (rear-mount drive)
Order No. M4818LL/A

Network Server 700 2x4.3GB Fixed Hard Drives with Bracket (rear-mount drives)
Order No. M4819LL/A

Other Drives

=====

Network Server DAT-2 4 mm Tape Drive (4GB/12GB) in Removable Tray

Order No. M4025LL/A

Network Server AppleCD 600 Quad-Speed Drive in Removable Tray

Order No. M4024LL/A

Expansion

=====

Network Server PCI RAID Disk Array Card with internal cables (supports RAID levels 0, 1, 0+1, 5, and 7)

Order No. M4030LL/A

Network Server External SCSI Cable for RAID Card, 50 inch (68 pin to 68 pin)

Order No. M4031LL/A

Apple PCI Ethernet Card (10MB/sec Ethernet Card-AAUI, Thin Coax, Twisted Pair)

Order No. M4709LL/A

Apple PCI FastEthernet 100Base-TX Card (100MB/sec FastEthernet Card-Twisted Pair)

Order No. M3906Z/A

Ethernet adapters

=====

Apple Ethernet Thin Coax Transceiver (cable not included)

Order No. M0329Z/B

Apple Ethernet Twisted Pair Transceiver

Order No. M0437Z/B

Apple Ethernet AUI Adapter

Order No. M0432LL/A

Other Accessories

=====

Network Server 700 Redundant Power Supply

Order No. M4035LL/A

Network Server 19-inch Rack Mount Kit

Order No. M4036LL/A

Network Server SCSI Drive Adapter Kit (includes one 50-pin adapter for Fast SCSI devices and one 68-pin Fast/Wide SCSI adapter, which allow installation of

third-party drive in empty tray)
Order No. M4028LL/A

Network Server Front Drive Bezel Kit (includes CD-ROM and DAT-2 drive bezels for empty tray)
Order No. M4029LL/A

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Network Server 500 & 700: Using a One Button Mouse (2/96)

=====

Article Created: 16 February 1996
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article describes how to obtain three button mouse functionality with a one button mouse.

DISCUSSION -----

The mouse most commonly used with AIX has three buttons. If you are using a one-button mouse, you can use the arrow keys on the keyboard for the middle and right mouse buttons, as follows:

- If you need to use the right mouse button, press the Right Arrow key.
- If you need to use the middle mouse button, press the Left Arrow key.

Network Server: Disk Management Utility & CommandShell (2/96)

Revised: 2/26/96
Security: Everyone

Network Server: Disk Management Utility & CommandShell (2/96)

=====

Article Created: 16 February 1996
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article provides a brief description of the Disk Management Utility and CommandShell that run on a remote Macintosh computer.

DISCUSSION -----

In addition to AIX 4.1.4, the software used to run the Network Server also includes the Disk Management Utility and CommandShell, which were created by Apple for use with AIX on the Network Server. These applications run on a remotely connected Macintosh computer. They connect to AIX daemon processes to allow you to perform system administration tasks.

- The Disk Management Utility

This application allows you to manage all aspects of disk storage. It uses a graphical user interface that offers various views of the disk storage structure as well as methods of adding to, deleting from, and modifying the disk storage structure. For more information, see Chapter 8, "Managing File Storage With the Disk Management Utility" in the "Using AIX, AppleTalk Services, and MacOS Utilities on the Apple Network Server" manual.

- CommandShell

This application is a terminal emulator that runs multiple windows on your screen so that you can run different AIX applications or processes simultaneously. For more information, see Chapter 9, "Remote Access With CommandShell" in the "Using AIX, AppleTalk Services, and MacOS Utilities on the Apple Network Server" manual.

Network Server: Standard AIX System Management Tools (2/96)

Revised: 2/26/96
Security: Everyone

Network Server: Standard AIX System Management Tools (2/96)

=====

Article Created: 19 February 1996
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article briefly describes the standard AIX system management tools found on the Network Server 500 and Network Server 700.

DISCUSSION -----

In addition to conventional command-line system administration, AIX includes several system management tools and installation utilities, including the Install Assistant, System Management Interface Tool (SMIT), and Visual System Manager (VSM).

Installation Assistant

The Installation Assistant application guides you through customization tasks. The interface for Install Assistant provides step-by-step instructions for completing each task. The application tells you why you would want to perform certain tasks. If you are familiar with the tasks, you can skip the instructions.

SMIT

SMIT is a menu-based tool that constructs and executes commands from the options you choose. With SMIT you can:

- install, update, and maintain software
- configure devices
- configure disk storage units in volume groups and logical volumes
- make and extend file systems and paging space
- manage users and groups
- configure networks and communication applications
- configure printers
- identify system problems

VSM

VSM provides a graphical interface that lets you manage your system by directly manipulating icons. You can use tools in VSM to perform many of the same tasks as the SMIT application. The VSM tool includes the following applications:

- Device Manager, which displays system objects and dialog boxes that represent your system's device configuration database. This allows you to manage objects such as graphic adapters, ports, buses, and memory cards.
- Print Manager, which allows you to perform basic SMIT tasks on printer and print queues.
- Storage Manager, which lets you manage physical volumes, volume groups, logical volumes, and file systems through manipulation of icons.
- Users & Groups Manager, which lets you add users with simple templates. You can also set passwords and the default interface for users.

For information on using VSM, see Chapter 6, "Using System Administration Tools" in the "Using AIX, AppleTalk Services, and Mac OS Utilities on the Apple Network Server" manual.

The software for the Network Server also provides Mac OS utilities that provide a Macintosh interface for logical volume management, the Disk Management Utility, and terminal emulation, CommandShell.

PlainTalk 1.4.x: Voice Rate Doesn't Work In SimpleText (2/96)

Revised: 2/19/96
Security: Everyone

PlainTalk 1.4.x: Voice Rate Doesn't Work In SimpleText (2/96)

=====

Article Created: 19 February 1996

TOPIC -----

When I adjust the voice rate in the Speech control panel v1.4.x to speak faster or slower, the change will not take effect in SimpleText. SimpleText always speaks at the same rate regardless of what is set in the Speech control panel. Why?

DISCUSSION -----

The Speech control panel that comes with PlainTalk 1.4.x has an option to adjust the rate of a particular voice. Macintosh Guide describes this function as follows:

"If you have a favorite computer voice, you can use the Voice option of the Speech control panel to specify it as the default voice. You can also indicate how fast the default voice will speak in most programs.

The default voice reads text aloud in most programs with text-to-speech capabilities, unless you specify otherwise. (Some programs have their own default voices and do not follow this setting.)"

When you set the rate in the "Voice" portion of the Speech control panel, you are setting the rate of the "Default voice." Only programs which offer a "Default voice" choice in the Voices sub-menu will be able to use this rate. SimpleText does not currently offer a Default Voice selection in the Voices sub-menu and therefore will not play voices at different rates, no matter what is selected in the Speech control panel.

This behavior may change in future versions of SimpleText or PlainTalk software.

System 7.5: Testing Extensions Conflicts w/ Extension Mngr 2/96

Revised: 2/19/96
Security: Everyone

System 7.5: Testing Extensions Conflicts w/ Extension Mngr 2/96

=====

Article Created: 19 February 1996

TOPIC -----

This article describes how test for extension conflicts using the Extension Manager provided in System 7.5 and greater. There are several third-party extension managers available for the Macintosh, however none of them provide the ability to use System 7.5 ONLY extensions.

DISCUSSION -----

Here are the steps you need reinstall the Apple Extension Manager (if necessary), and test for extension conflicts.

Step 1

Open the Control Panel folder located in your System folder.

Step 2

Find the Extensions Manager control panel. If you cannot find the Extensions Manager control panel, look for a folder inside your System folder called "Control Panels (disabled)".

Step 3

Launch the Extensions Manager

Step 4

Either write down all the items with a checkmark next to them, or use the Save Set option in the Sets menu to create a temporary set.

Step 5

Choose System 7.5 Only or System 7.5.2 Only from the Sets Menu.

Step 6

Close the Extensions Manager (at this point the Extensions Manager will move all non-System 7.5 Extension to the proper disabled folder.)

Step 7

Restart your Macintosh computer.

At this point your Macintosh computer is using only System 7.5 or System 7.5.2 extensions.

Step 8

Test your Macintosh. Verify that the problem does not reoccur with only System 7.5 extensions running.

Returning Your Previous Extensions

=====

Step 1

Open the Extensions Manager

Step 2

Either select the extensions and control panels previously installed, or if you saved a temporary set, choose that set from the Sets menu.

Step 3

Restart your Macintosh

AppleVision 1710 Display: Diagonal Colored Lines (5/96)

Revised: 5/2/96
Security: Everyone

AppleVision 1710 Display: Diagonal Colored Lines (5/96)

=====

Article Created: 19 February 1996
Article Reviewed/Updated: 2 May 1996

TOPIC -----

I am seeing diagonal colored lines on my AppleVision 1710 display. Is this a known problem with this monitor? Has it been reported by anyone else?

DISCUSSION -----

OVERVIEW
=====

Some customers have complained that they see 9 "sets" of horizontal lines about 1-inch apart, running from left to right at approximately a 30 degree angle on their AppleVision 1710 displays (not the AppleVision 1710AV Display).

Each set is made up of thin Blue, Green, and Red lines that are very close together. They are most apparent when looking at the black space on each side of the display and are more prominent on the left.

Suggested Steps For Examining The Display
=====

Some displays can show this symptom when the controls are set too high and can be readjusted to acceptable levels with the from panel controls. To adjust the controls, perform the following steps:

Step 1

Connect the display to another computer, if possible, to verify that the problem follows the display.

Step 2

Check the screen brightness and contrast to verify that they are not set too high. Normal settings for contrast are between the middle point of the adjustment to maximum, and brightness between the lower point of the adjustment to middle.

If adjusting the brightness and contrast controls cannot remove the lines, contact an Authorized Apple Service Provider to have the AppleVision Display tested.

Power Macintosh: Freezes & Crashes with Microsoft Office (3/96)

Article Created: 20 February 1996
Article Reviewed/Updated: 15 March 1996

TOPIC -----

I have a Macintosh PowerBook (Duo) 2300c running System 7.5.2 and System Update 2.0. I mostly use Microsoft Office applications with the 4.2 update patch installed.

The problem is that if Apple Menu Options (AMO) 1.1 loads at startup, Microsoft Word crashes and locks up the computer. If Apple Menu Options 1.0.2 is installed, I have no problems. Shouldn't the newer version of AMO fix problems, not cause them?

DISCUSSION -----

Issue

The patch you mentioned from Microsoft called "Office4.2x Update for PowerMac version 1.0" is NOT compatible with System Update 2.0 for System 7.5.2 (which included AMO 1.1).

Symptoms

When launching Microsoft Office applications OR when using menus in Microsoft Office applications, the computer will freeze. Also when you run the PowerPC versions of Microsoft Excel (5.0) and Microsoft Word (6.0.1) under System 7.5.3, the applications crash occasionally. The only way out of the freeze is to shutdown/restart by powering off or resetting the computer.

Solution

The problem is with version 1.0 of the Office4.2x Update for PowerMac. If you install the newer version (1.0.1), the problem will be corrected.

"Office4.2x Update for PowerMac" version 1.0.1 is needed on all Power Macintosh

computers, including all Power Macintosh PowerBook computers. It is available directly from Microsoft and from any online service where they post updates.

Network Server 500 and 700: Installing AIX (2/96)

Revised: 2/26/96
Security: Everyone

Network Server 500 and 700: Installing AIX (2/96)

=====

Article Created: 20 February 1996
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article describes installing AIX on your Network Server 500 or Network Server 700.

DISCUSSION -----

Before you install
=====

Before you begin the AIX installation process, do the following:

- Set up your hardware and connect any peripheral devices such as an additional hard disk drive.
- Locate your Installation CD.
- Obtain the Network Server key.

You must install the operating system on the local system (your Network Server). For information about setting up your hardware, see "Setting Up Your Network Server."

Installing the AIX Base Operating System
=====

Follow these steps to install the AIX Base Operating System.

Step 1

Turn on your Network Server.

Step 2

Insert the Installation CD into the drive.

Step 3

Turn the front key to the left (service) position.

Step 4

Restart your Network Server with the CD in the drive.

To restart your system, press the reset button. When your system starts, it will use the Installation CD as the startup disk. A message appears asking you to define the system console.

Step 5

Press F1 and then Enter to use the local display as your console.

If you have a standard keyboard (without function keys), the top row of the keypad serves as the function keys F1 through F4. If you have a standard keyboard, press the Clear key on the keypad instead of F1.

Step 6

When prompted, select a language for installation instructions.

For English, type 1 and press Enter.

The following message appears on your screen.

Begin_Graphic

```
-----  
| Welcome to the Base Operating System |  
|                                     |  
| Installation and Maintenance       |  
|                                     |  
| Type the number of your choice and press Enter. |  
| Choice is indicated by >>>. |  
|                                     |  
| >>> 1 Start install now with default settings |  
|      2 Change/show installation settings and install |  
|      3 Start maintenance mode for system recovery |  
|                                     |  
|      88 HELP ? |  
|      99 PREVIOUS MENU |  
|                                     |  
-----
```

End_Graphic

Step 7

To begin installation, type 1 and press Enter.

To examine or modify installation settings, you can type 2 and press Enter.

The Installation and Settings screen appears.

Begin_Graphic

```
-----
|  Installation and Settings
|
|  Either type 0 and press Enter to install with current
|  settings, or type the number of the setting you want to
|  change and press Enter.
|
|  1. System Settings
|
|      Method of installation.....Preservation
|      Disk where you want to install.....hdisk0
|
|  2. Primary Language Environment Settings (after
|  install):
|
|      Cultural Convention.....English (United States)
|      Language.....English (United States)
|      Keyboard.....English (United States)
|      Keyboard Type.....Default
|
|  3. Install Trusted Computing Base.....No
|  >>> 0 Install AIX with current settings listed above.
|      88 Help ?
|      99 Previous Menu
|
|  WARNING: Base Operating System installation will destroy
|  or impair recovery of some data on the destination disk
|  HDISK0.
|
|  -----
```

End_Graphic

Use this screen to specify the following:

- the installation method

You can choose either the New and Complete Overwrite option or the Preservation Install option. The New and Complete Overwrite option erases all the information on your hard disk before installing the BOS. The Preservation Install option keeps the user data in the root volume group when it installs the BOS.

- the destination disk
- the language environment

- the Trusted Computing Base (TCB) setting

The Trusted Computing Base tries to ensure that the programs you run are trusted programs. If you want to change the TCB setting, do so during installation. This setting cannot be changed later.

Step 8

When you have selected the appropriate settings, type 0 and press Enter to begin the installation.

The Installing Base Operating System dialog box appears, which shows you the progress of the installation and informs you when the installation is complete. The installation process for the BOS takes about 20 to 30 minutes to complete.

Step 9

Turn the front key back to the upright (unlocked) position before the installation completes.

When the BOS installation completes, the installation program restarts your computer. The key must be in the upright position during this restart to boot from the hard disk instead of the CD. The BOS is now installed, and you can customize your installation.

Installing additional software

=====

Once you have installed the BOS, you need to install additional software, such as the extensions to the AIX operating system provided by Apple Computer.

To install additional software, use the Installation Assistant. After you have installed the BOS, your computer restarts and automatically starts the Installation Assistant application. The Install Assistant application guides you through the installation process and provides step-by-step instructions for completing each task.

To install additional software using the Installation Assistant:

Step 1

Click Install Software Applications from the Installation Assistant Task List.

A menu appears with several items.

Step 2

Click Install a Bundle of Software (Easy Install).

An Easy Install dialog box appears for additional installation information.

Step 3

Specify the CD-ROM drive as the software source.

Step 4

Select the All Licensed option as the bundle of software to install.

To select this bundle, you need to scroll to the bottom of the list of bundles and click the All Licensed icon.

Step 5

Click Install/Update.

The installation process begins. This process requires about 45 to 55 minutes to complete.

Step 6

Click Exit.

When you click Exit, you exit Easy Install and return to the task list for the Installation Assistant.

Step 7

Click Tasks Completed -- Exit to AIX Login.

You must click the Tasks Completed option to quit this application to ensure proper installation of the software.

NOTE: If you install from a terminal, a text-based Installation Assistant installs additional software. To install the necessary software with the text-based Installation Assistant, choose the custom install option and select the all_licensed bundle to install.

Network Server 500 & 700: Setting Display Resolution (2/96)

Revised: 2/26/96
Security: Everyone

Network Server 500 & 700: Setting Display Resolution (2/96)

Article Created: 20 February 1996
Article REviewed/Updated: 26 February 1996

TOPIC -----

This article describes setting your display resolution on your Network Server 500 or Network Server 700.

DISCUSSION -----

After you've installed the operating system, you may want to customize your display resolution.

To set your screen preferences, you need to log in to AIX. To set your screen preference the following steps:

Step 1

Start SMIT.

To start SMIT, enter "smit" on the command line.

Step 2

Choose Devices.

The Devices menu appears.

Step 3

Choose Graphic Displays.

The Graphic Displays menu appears.

Step 4

Choose Display Resolution and Refresh Rate.

SMIT displays a list of available devices.

Step 5

Click the device name.

A dialog box appears with the attributes for the device.

Step 6

Specify your resolution and refresh rate.

Use the List button to display the available resolutions and refresh rates. For example, you can set your resolution and refresh rate to 1024x768@72Hz.

Step 7

Click OK.

Step 8

Restart your system.

PowerBook 2300 & 5300: Do Not Need JLK Font Extension 3 (2/96)

Revised: 2/20/96
Security: Everyone

PowerBook 2300 & 5300: Do Not Need JLK Font Extension 3 (2/96)

=====

Article Created: 20 February 1996

TOPIC -----

The Read Me files for the PowerBook 5300 and 2300 series computers say that if the Japanese Language Kit (JLK) version 1.2 is installed, the Font Extension 3 file needs to be installed as well. The ReadMe file directs you to the Apple Extras folder to find the Font Extension 3 file, but it is not there. Why not?

DISCUSSION -----

The reference to this file in the ReadMe for the PowerBook 5300 and 2300 series computers is in error. As of this writing, only the PowerBook 190 series computers require the Font Extension 3 file if Japanese Language Kit 1.2 is being used. On the PowerBook 190 series computers, the file can be found in the Apple Extras folder as referenced in the ReadMe.

The PowerBook 5300 and 2300 series computers do not require the Font Extension 3 file and the reference in the ReadMe should be ignored.

Network Server: Backing Up System After BOS Install (2/96)

Revised: 2/26/96
Security: Everyone

Network Server: Backing Up System After BOS Install (2/96)

Article Created: 20 February 1996
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article describes backing up your system after installing the AIX basic operating system (BOS) on your Network Server 500 or 700.

DISCUSSION -----

After you have installed the BOS and performed your initial customization and configuration, it is a good idea to create a system backup. You use a backup to restore a corrupted file system and recover data.

You can use the Installation Assistant to create a backup after your initial installation. You can also use the System Management Interface Tool (SMIT) to make a backup. SMIT uses the mksysb command to create a backup image that you can store either on a tape or in a file. If you choose to back up to tape, the backup program writes to tape a boot image that you can use for installation on other systems.

For more information on using SMIT, use InfoExplorer.

Configuring before the backup

Configure your system before you create a backup image if you want the image to be identical and have the same users, passwords, network addresses, and so on. However, if you plan to use the backup image to install the BOS on other Network Servers, create the backup image before configuring the system.

If you install the backup image on other systems, you might not want passwords and network addresses copied. Using the same passwords on many systems can create a security risk, and copying network addresses creates duplicate addresses and can disrupt communications.

The BOS installation program automatically installs only the device drivers

required for the hardware configuration of the installed machine. Therefore, if you are installing a system backup on other machines, you may need to install additional device drivers on the source system before making the backup image.

To install additional device support on the source system, use the Install Additional Device Software SMIT menu item.

Creating a backup

Follow the steps below to create a system backup:

Step 1

Log in as root.

Step 2

Mount all file systems you want to back up.

Refer to the mount command for details.

Step 3

Free at least 8.8 MB of disk space in the /tmp directory or increase the size of your disk partition.

The mksysb command requires this working space. To determine the free space in the /tmp directory, use the df command. If necessary, use SMIT or the chfs command to change the size of the file system.

Step 4

Enter the following SMIT command:

```
smit mksysb
```

The Back Up the System screen appears.

Step 5

Select how you want to store the backup.

Press F4 to list available tape devices.

Step 6

If you want to create map files, select the Create Map Files field.

Map files match the physical partitions on a drive to its logical partitions.

Step 7

If you want to create a bootable backup, leave the default of yes. If you do not want a bootable backup, press Tab to change the option to no.

Step 8

Specify if you want to expand the /tmp directory if you have a bootable backup.

Step 9

Specify the number of blocks to write in a single output, or leave the field

blank to accept the system default.

Step 10

For a file backup, press Enter. For a tape backup, insert a tape and press Enter.

The Command Status screen appears.

If you are creating a tape backup, the system may prompt you to insert another tape.

Step 11

When the backup completes, exit SMIT.

The backup is complete. If you created a bootable tape, it can start your system if you are ever unable to start it from the hard disk.

Verifying a backup tape

You can use the procedures in this section to view the contents of a backup tape. The contents list verifies most of the information on the tape, but it does not verify that the tape can be used for installations. The only way to verify a boot image on a tape is to try to start the system from it.

To verify a backup tape:

Step 1

Enter the following SMIT command:

```
smit lsmksysb
```

The List Files in a System Image screen appears.

Step 2

Type the number of blocks to read for your tape device, or leave the field blank to accept the system default.

Step 3

Either type the tape device name in the second field or accept the name provided.

Step 4

Press the Enter key.

The Command Status screen appears listing the contents of the backup tape.

Power Macintosh 7200 Is Upgradeable to 7500 and 7600 (10/96)

Revised: 10/4/96
Security: Everyone

Power Macintosh 7200 Is Upgradeable to 7500 and 7600 (10/96)

=====

Article Created: 21 February 1996
Article Reviewed/Updated: 4 October 1996

TOPIC -----

I have a Power Macintosh 7200/90 computer. I know my computer does not have a processor card like the Power Macintosh 7500/100 computer, but will there still be a way I can upgrade my computer in the future?

DISCUSSION -----

7500 Upgrade (no longer available)

At the time it was released, Apple announced that there would be an upgrade option available for the Power Macintosh 7200 series computers. This upgrade would be accomplished by installing a logic board upgrade. After the upgrade the Power Macintosh 7200 series computer would be the equivalent of the Power Macintosh 7500 series computers.

7600 Upgrade

The 7200 to 7600 Logic Board Upgrade* (M3842LL/A) will allow customers with a Power Macintosh 7200 to upgrade their systems to a Power Macintosh 7600. The Power Macintosh 7600 has replaced the Power Macintosh 7500.

*IMPORTANT NOTE:

This logic board upgrade ships WITHOUT a Processor Upgrade Card. You will have to purchase one separately. This gives you the opportunity to decide how fast a processor you want to add to your system. At the time of this writing there are two Processor Upgrade Cards available from Apple. Both have PowerPC 604 processors running at 120MHz (M4731LL/A) and a 132MHz (M4875LL/A).

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change. Contact your Apple reseller for the latest information.

Network Server 500 & 700: Hot Swappable Drives & RAID (9/96)

Revised: 9/13/96
Security: Everyone

Network Server 500 & 700: Hot Swappable Drives & RAID (9/96)

=====

Article Created: 21 February 1996
Article Reviewed/Updated: 12 September 1996

TOPIC -----

This article describes the need for an optional Network Server PCI RAID Card at RAID level 5 for hot swappable drives.

DISCUSSION -----

The Network Server 500 and Network Server 700 contain a flexible SCSI backplane that allows the easy removal and insertion of SCSI devices. The removal or insertion of a SCSI device while the system is running causes a reset of the SCSI bus. The ability to handle the SCSI reset is operating-system dependent. AIX does not have the ability to handle this reset, which may lead to data corruption when the reset occurs. The optional Network Server PCI RAID Card, M4030Z/A, buffers the AIX operating system from the consequences of drive insertion and removal when the drive is part of a RAID configuration setup for RAID Level 5.

In summary: hot-swapping drives on the Network Server 500 and 700 requires that the drives be part of a RAID Level 5 configuration with the Apple Network Server PCI RAID Disk Array Card.

This article was published in the Information Alley on 13 September 1996.

QuickTake Camera: Battery Life Improvement Hints (6/96)

Revised: 6/18/96
Security: Everyone

QuickTake Camera: Battery Life Improvement Hints (6/96)

=====

Article Created: 21 February 1996
Article Reviewed/Updated: 17 June 1996

TOPIC -----

How long should my batteries in my QuickTake camera last? I understand that there are factors that affect battery usage, such as the flash and image downloading, but is there some general guideline for the batteries life?

DISCUSSION -----

The QuickTake Battery life using alkaline batteries is approximately 50 images, 50% of which are flash images, including image transfer to a computer. Battery life using NiCad (Eveready CH15) batteries is approximately around 100 images, 50% of which are flash images, including image transfer to a host.

There are many factors that can affect battery life with any product and it is very important that you use this information when calculating the total number of pictures the QuickTake Camera should create.

Battery Recommendations for QuickTake Cameras

=====

Here are a few battery recommendations for the Quicktake Cameras:

- Alkaline batteries exhibit an extremely short life when used with the QuickTake Cameras and should only be used when NiCad batteries (rechargeable batteries) are not available.
- The best and preferred recommendation for lasting performance is to use lithium batteries. The second best choice is to use NiCad batteries. The reasons for these recommendations are directly related to the current/voltage demands of the camera and the individual battery characteristics.

Improving Battery Performance

=====

- When you replace batteries, replace all the batteries in the camera. Do not mix old and new batteries. If you use a mix of new and old batteries, you hinder the performance of the fresh batteries.
- If you are using rechargeable NiCad batteries, replace batteries that are running low with a complete set of fully charged batteries.
- Batteries work best when the contact surfaces are clean. If necessary, clean these surfaces by gently rubbing with a clean pencil eraser or a cloth.

Accelerated Graphics Card: WordPerfect Corruption Issue (10/96)

Revised: 10/8/96
Security: Everyone

Accelerated Graphics Card: WordPerfect Corruption Issue (10/96)

=====

Article Created: 21 February 1996
Article Reviewed/Updated: 8 October 1996

TOPIC -----

Sometimes when using WordPerfect with the Apple Accelerated Graphics Card in the Power Macintosh 9500 the WordPerfect toolbars become corrupted after they overlay each other.

DISCUSSION -----

This issue appears only when using the Apple Accelerated Graphics Card with WordPerfect, and when WordPerfect toolbars are enabled from left to right overlaying each other. All other display functions work properly. Other video cards do not have this problem.

The Apple Accelerated Graphics Card is based on the mach64 Graphics Accelerator card from ATI Technologies, Inc. A newer version (1.0.7) of the Graphics Accelerator extension has been developed by ATI to fix this problem. Apple has posted the new extension to all Apple Software Updates sites in the Unsupported section.

Since the new extension was developed by ATI and was not fully tested by Apple, it is not officially supported by Apple. It has been posted for customer convenience. The changes in this version are minimal and should not cause any stability or performance problems.

If you encounter any problems with this version of the Graphics Accelerator extension, remove it from the Extensions folder and replace it with the older version.

This article appeared in the 8 October 1996 issue of the Information Alley.

Article Change History:
08 Oct 1996 - Updated to include new extension information.

Newton 2.0 OS: Recommended modems list (2/96)

Article Created: 21 February 1996

TOPIC -----

To assist our customers in meeting their communications needs, Apple has compiled a listing of recommended modems for use with the MessagePad 120 with the Newton 2.0 Operating System.

DISCUSSION -----

While a sample of each of these modems has been tested by Apple, modem manufacturer specifications are subject to change without notice, resulting in potential incompatibilities. Accordingly, Apple Computer, Inc. cannot guarantee the operability of any individual modem and will not be liable for damages resulting from the use of this information. Not responsible for typographical errors. Please contact the manufacturer for additional information.

Begin_Table

Manufacturer	Model	Modem Setup	Type
AirPlex	FAXMODEM	Hayes EC	PC
Apple	Newton Fax Modem (Internal)	Newton Modem	PC
	Newton Fax Modem (External)	Newton Modem	EXT
Apex Data	Mobile Plus 14.4	Hayes EC	PC
AT&T	KIT 3760-B1-261 (landline only)	Hayes EC	PC

Network Server 500 & 700: Comparison Chart (2/96)

Article Created: 22 February 1996
Article Reviewed/Updated: 26 February 1996

TOPIC -----

This article is a comparison chart for the Network Server 500 and 700.

DISCUSSION -----

Here is a chart comparing the Network Server 500 and 700.

Begin_Table

Network Server	500/132	700/150
-----	-----	-----
Processor Type	PPC 604	PPC 604
Processor Speed	132MHz	150MHz
CPU Cards	Yes	Yes
L2 Cache	512K	1MB
Main Memory (shipped with)	32MB	32 Or 48MB*
Main Memory (expandable to)	512MB	512MB
PCI Slots	6	6
Internal Storage Devices Supported	7	9
Total Internal Storage Capacity	24GB	32GB
Total Overall Storage Capacity	332GB	340GB
Apple SuperDrive	Yes	Yes
AppleCD 600i	Yes	Yes

* Depending on system ordered.

AppleVision Display Software: ReadMe File (1/97)

Revised: 1/29/97
Security: Everyone

AppleVision Display Software: ReadMe File (1/97)

=====

Article Created: 22 February 1996
Article Reviewed/Updated: 29 January 1997

TOPIC -----

This article contains the Read Me file for the AppleVision Display Software, which is designed for the AppleVision 1710 Display and AppleVision 1710AV Display.

DISCUSSION -----

Information About Your AppleVision Display Software

This document contains important reminders and the latest product information.

Installation and Setup Tips
=====

Follow the instructions in the manual that came with your display to install the AppleVision software. Keep the following tips in mind when setting up and working with your display and display software:

- If you upgrade your system software, you must reinstall the AppleVision display software.
- With some system software and hardware configurations, your screen may not redraw correctly during the boot process. This will not affect display performance.
- Changes you make to screen geometry apply only to the display's current resolution. Geometry settings are saved with the resolution.

Sound and Video Tips
=====

If you purchased a display with speakers and built-in microphone, the following

tips may help you:

- The Sound control panel controls your computer's sound. The AppleVision Setup control panel controls the display's sound. When you make changes to sound input and output sources, be sure to use the appropriate control panel.
- If you're using system software earlier than version 7.5, your computer may have a long restart time. To improve restart time, change the name of the AppleVision system extension so it installs after QuickTime. (Pick a name that appears alphabetically after "QuickTime.")
- Whenever you change from an AppleVision display on your computer to a small-screen, fixed-resolution display (14" or less), set the resolution on the AppleVision display to 640x480 before switching off your computer and disconnecting the display. This will prevent scrambled video during the boot process on the small-screen display.
- If you use the AppleVision display with a Macintosh Quadra 630, Macintosh LC 630, Performa 630, or Power Macintosh 6200 computer, make sure you specify the correct sound input source in the Sound control panel. Choose Line In, not Microphone.

Notes About Specific Application Programs

=====

- Some application programs do not properly support resolution changes you make to your display. You may have to close and restart your program for the program to recognize the resolution changes.

DISCUSSION -----

Information About Your Color StyleWriter 2400 Printer

=====

This document contains important reminders and some information that's not in the user manual.

Installation and Setup Tips

=====

Follow the instructions in the user manual to install the Color StyleWriter 2400 software. Keep the following tips in mind when setting up and working with your new software:

- If you are having problems during installation, restart with Extensions off and try installing again.
- After installing the printing software, you must create a desktop printer. To do so, select the Color SW 2400 in the Chooser, then close the Chooser.
- If you have a PowerBook computer, see "Special Information for PowerBook Users" in the section "Telling Your Computer to Use the Color StyleWriter 2400" in Chapter 1 of the user manual.
- If you get the message, "Serial port in use by another application, please quit the application and try again," restart your Macintosh before trying to print again.

- If you upgrade your system software, you must reinstall the Color StyleWriter 2400 software.
- Close the Chooser after making any changes to it.
- See the Troubleshooting chapter in the Color StyleWriter 2400 user manual for more information.

About Desktop Printing

=====

Your new printing software comes with Desktop PrintMonitor version 1.0.3. You use Desktop PrintMonitor to create printer icons (or "desktop printers") on your Macintosh Operating System (Mac OS) desktop. You can print a document by simply dragging it to a desktop printer icon. Desktop printers also give you more control over printing, including setting printing priorities and choosing specific times for printing.

Installed Desktop Printing Files

=====

The following files are installed for desktop printing on computers that use version 7.1 or later of the Mac OS:

- Desktop PrintMonitor, Desktop Printer Spooler, and Desktop Printer Extension are placed in the Extensions folder.
- If your computer has version 7.1.1 or 7.1.2 of the Mac OS, Finder 7.1.3 is placed in your System Folder and Finder Help 7.1.3 is placed in the Extensions folder.
- If your system has version 7.1.1 or 7.1.2 of the Mac OS, these files are placed in the Extensions folder: Thread Manager 2.1, Network Extension 7.1.3, Macintosh Drag and Drop, and Dragging Enabler.

Creating Desktop Printers

=====

You create desktop printers by selecting a printer in the Chooser. A desktop printer icon appears on your desktop when you close the Chooser.

You can drag this icon to any position you want on your desktop. You cannot move it off the desktop.

If you want, you can select other printers in the Chooser and create other desktop printers for easy access. You must close the Chooser each time to create a desktop printer.

The last desktop printer created becomes the default printer. Your documents will automatically be printed on the default printer.

Printing With Desktop Printers

=====

You can print documents within your applications as you normally do. You can also print documents without leaving the Finder, using one of the two methods

described here. These methods are particularly efficient when you have a number of documents created by the same application that you want to print at once.

- Drag the icons of the documents (all created by the same application) to the desktop icon of the printer you want to use.
- Select the icons of the documents you want to print and choose the Print command from the File menu.

The computer will show you the Print dialog box so you can choose printing options. Make your choices, then click the Print button.

After a few moments, the document starts to print. If background printing is turned on, you can continue working while the document is printing.

Selecting a Default Printer =====

If you have more than one printer available, you can select which you want to use. The printer you select is called the "default printer." All your documents will be printed on the default printer until you select a new one.

To change the default printer, use one of these three methods:

- Drag the document you want to print to a desktop printer icon, and it will automatically become the default printer.
- Select the desktop printer icon and use the Printing menu to set the printer as the default.
- Select a new printer using the Chooser.

Note:

Switching between printers may change how much information you can fit on a page. It's best to choose a printer before you spend much time formatting the document.

Working With Desktop Printer Icons =====

Desktop printer icons change to indicate printing status:

You can do the following with desktop printer icons:

- Throw away the icon. Drag the icon to the Trash. You can't throw away a desktop printer icon while the printer is printing a document. (You can create another desktop printer icon for that printer whenever you like.)

Note:

You must always have at least one printer icon on your desktop. If you throw away the last icon, it will immediately be created again.

- Rename the icon. Rename the icon as you would any other Finder icon. Click the name to highlight it, then type the new name. This changes the

name of the icon, not the name of the printer.

- Move the icon. You may drag the icon anywhere you like on the desktop. However, you may not move it off the desktop.
- Create an alias for the icon. You may create an alias for the icon as you would any Finder icon, by selecting the icon and choosing the Make Alias command from the File menu. The alias may be moved anywhere on or off the desktop.

Monitoring Printing =====

If you are using background printing, you can use the desktop printer features to monitor and control the documents that are waiting to print. To learn how to turn background printing on and off, see your printer manual.

To monitor the printing of documents:

Step 1 -----

Double-click the desktop printer icon you're interested in.

A window opens listing the documents that are printing or waiting to print.

Watching the status messages can be helpful when troubleshooting printing problems. When more than one job is waiting to be printed, a list of print jobs appears in the waiting list, showing the order in which they will be printed (when sorted by print time.)

Step 2 -----

Choose what you'd like to do.

- To cancel a print request, select it by clicking its icon and click the Remove button.

You can select only the currently printing document by clicking its icon. (You can select more than one item at a time by holding down the Shift key while clicking.) You can also drag the icon for the print request to the Trash. Note that these methods delete only the print request (also referred to as a spool file), not the document itself.

- To put a print request on hold, select it and click the Hold button.

The print request will stay on hold until you select it again and click the Resume button. You can also put the document that's currently printing on hold by dragging it to the list of documents waiting to print (lower part of the window).

- To indicate that a print request is urgent, select it and choose Set Print

Time from the Printing menu. In the dialog box that opens, click Urgent.

- To indicate that a print request should not print until a future time, select it and choose Set Print Time from the Printing menu. In the dialog box that opens, click At Time, then set the time you want.
- To change the order of the items waiting to print, move their place in the list by dragging their titles up or down in the list.
- To sort the list of documents waiting to print, click the title of the column you want to sort by.

For example, to sort by the name of the document, click "Document Name." (You can also sort by choosing the commands in the View menu.) The column title you sorted by is underlined. Sorting the items does not change the order in which they will print. To see that order, sort by Print Time.

- To temporarily stop all documents from printing on this printer, choose Stop Print Queue from the Printing menu.

To resume using the printer, choose Start Print Queue from the Printing menu. If the Desktop PrintMonitor window is open, you can begin printing the document from the first page by Option-clicking the Resume button (holding down the Option key while clicking the Resume button).

Shortcut: The Printing menu for starting and stopping the print queue is available without opening the window for the printer, as long as the printer's icon is selected on the desktop.

- To move a print request from one printer to another printer of the same type (for example, from a StyleWriter 1200 to a StyleWriter 2400), drag the icon for the print request to the icon of the printer where you want to move it.

The printing software won't let you move a print request to an incompatible printer. For example, you can't move a request from a LaserWriter printer to a StyleWriter printer.

Turning the Manual Feed Notification On or Off =====

When you install the printer software, the Desktop PrintMonitor is set up to notify you about manually feeding paper the same way your PrintMonitor was set. For example, if you turned off notification for manual feeding in your PrintMonitor, the Desktop PrintMonitor will also have manual feed notification turned off.

If you want to change how the Desktop PrintMonitor notifies you about manual feeding, follow this procedure:

Step 1 -----

Hold down the Shift key and restart your computer, keeping the Shift key

depressed until the message "Extensions off" or your normal desktop appears.

Step 2

Open your System Folder and then open your Extensions folder.

Step 3

Double-click the PrintMonitor application.

Step 4

Choose Preferences from the File menu.

Step 5

Select your manual feed option and click OK.

Step 6

Close the PrintMonitor.

Step 7

Restart your computer.

Turning Off or Removing the Desktop Printing Software

=====

Removing a Desktop Printer Icon

You can remove an individual desktop printer icon by dragging it into the trash. If you have only one desktop printer, you can't get rid of the icon by dragging it to the Trash. (The icon will reappear if you do.) To get rid of the desktop printer, you must first select a different desktop printer as the default printer and then drag the desktop printer icon to the Trash. If you don't want to use desktop printer icons, see "Turning Off the Desktop PrintMonitor" or "Removing Desktop Printing Software" for information about how to remove the desktop printer software.

Turning Off the Desktop PrintMonitor

If you don't want to use desktop printers, you can turn off the Desktop PrintMonitor using the Extensions Manager (available on Macintosh System 7.5, the current version of the Mac OS).

To turn off the Desktop PrintMonitor:

Step 1

Open the Extensions Manager control panel in the Control Panels folder.

Step 2

Click to deselect (uncheck) the Desktop PrintMonitor, Desktop Printer Extension, and Desktop Printer Spooler extensions in the panel.

Step 3

Click the close box to close the control panel.

Step 4

Restart your computer.

Removing the Desktop Printing Software

=====

The desktop printing software uses both the Desktop PrintMonitor and the PrintMonitor software. The Desktop PrintMonitor requires 200-400K bytes more free system memory in addition to the memory required by the PrintMonitor. If you don't want to use the desktop printing software, you can remove it.

To remove desktop printing software:

Step 1

Restart your computer with the extensions off by holding down the Shift key and choosing Restart from the Special menu. Hold the Shift key down until the message "Extensions off" appears or until your normal desktop appears.

Step 2

Drag the following files from the Extensions folder to the Trash:

- Desktop PrintMonitor 1.0.3
- Desktop Printer Spooler 1.0.3
- Desktop Printer Extension 1.0.3

Step 3

Restart your computer.

Using Save or Open with Desktop Printers

=====

When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

Having More Than Five Desktop Printers

=====

If you want to have more than five or six desktop printers, you must increase the Desktop PrintMonitor memory allocation by 12K for each additional desktop printer you want. To do so, select its icon (it's in the Extensions folder inside the System Folder), choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

About Creating Duplicate Desktop Printer Icons

=====

If you use different versions of the printer software and print using the Desktop PrintMonitor, you may create duplicate desktop printer icons for the same printer. For example, say you select between two versions of the StyleWriter software. If you select your printer in the Chooser using one version, and select it later using the another version, two desktop printer icons will appear for that printer. To avoid creating confusing duplicate printer icons, primarily use one version of your printer software, or rename the icons with distinguishing names.

Using Desktop PrintMonitor on a Non-English System

=====

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an older version of the PrintMonitor. Newer versions of the PrintMonitor are not replaced.) You have three choices:

- Use PrintMonitor 7.1.2 (or a later version)
- Obtain a set of installation disks of the printer software in the language of your system software from your Apple-authorized dealer and install it.
- Upgrade your system software to System 7.5 and install the printing software again. An English-language version of the Desktop PrintMonitor is installed.

Low-Memory Troubleshooting

=====

If you notice any of these symptoms, your Macintosh may be running out of memory.

- The edges of some letters appear jagged.
- The Macintosh displays "out of memory" warning messages.
- Some portions of a document don't print.
- Some text prints in the Geneva font instead of the font you selected.

To make more memory available, try these suggestions:

- Have only one program open at a time.
- Increase the amount of memory you give to the program you're printing from by using the Get Info command (as explained in the documentation that came with your Macintosh).
- Use the Chooser to turn off background printing, as explained in Chapter 2 of the user manual.
- Remove any watermarks from your document.
- In the Page Setup dialog box, choose Portrait (normal) orientation instead of Landscape (sideways) orientation.
- Choose Normal in the Print dialog box and Pattern in the Print Options dialog box.
- Desktop printing requires more memory to print than the old PrintMonitor. You can remove desktop printing by using the custom install option called "PrintMonitor 7.1 (no Desktop Printing)."
- When you print in the background, if you often get a message that there is not enough memory to print on a certain desktop printer, you can give that desktop printer more memory by selecting its icon and choosing the Get Info command. Then increase the number in the Preferred Size box. (For more information on increasing a program's memory, see the documentation that came with your Macintosh.)
- As long as there are any print requests waiting to be printed, Desktop PrintMonitor (the desktop printing software) remains active in memory, even when background printing is off. If you are not printing in the background, you can remove all print requests from your desktop printer queues to reduce memory requirements by 160K.
- Use the Memory control panel to turn on virtual memory, as explained in the documentation that came with your Macintosh.
- Try a program like RamDoubler.
- See the "Troubleshooting" chapter in the Color StyleWriter 2400 user manual for more suggestions.

Color Printing Tips

=====

- When printing very light colors in grayscale mode, you may see thin lines fade or break up. If this happens, pick a darker color for the affected object, or try printing with the Pattern halftoning option selected. (In the Print dialog box, click the Color button, then select the Pattern option.)

- If you print a document that should have a smooth gradient from one color or shade to another and notice an unexpected color change, it may be that one of the colors in the gradient cannot be reproduced by the printer. Try using a different matching method in the Color Options dialog box, or try turning off ColorSync.
- If the blues on your printout appear purple, turn on ColorSync in the Color dialog box.
- In some programs, colors on the screen may look solid but contain tiny black dots when printed. To print solid blocks of color without these black dots, use the Business Graphics color-matching method. In the Print dialog box, click the Color button. In the Color Options dialog box that appears, make sure there is an X in the ColorSync box, and then select Business Graphics from the Matching Method pop-up menu.

If your colors still have too many black dots, create the document in a program that allows you to define each color, then make the color fully saturated. For example, to print yellow without any black dots in it, use your program to define the yellow you are using as 100% red and 100% green without any blue.

Watermark Tips

=====

When using a watermark, make sure the font that is in the watermark file is also in the Fonts folder inside your System Folder. If you give the watermark file to someone, they also need any fonts that it uses in order to use the watermark in their own documents.

Tips on Sharing Your Printer

=====

- To avoid confusion, be sure to give each shared Color StyleWriter 2400 printer a unique name. If you have more than one printer with the same name in a single AppleTalk zone, the Chooser will display only one of them.
- To clean the print head of a shared Color StyleWriter 2400, you must send the request from the Macintosh that is directly connected to the printer.

Other Printing Tips

=====

- If you see very thin stripes near the bottom of your printout, use your application program to make your bottom margin larger. A bottom margin of 0.8 inches or greater is best.
- For best results when printing envelopes, do not put images or text along the bottom edge of the envelope.

Printing With QuickDraw GX =====

If you have QuickDraw GX on your system, the Color StyleWriter 2400 Installer will automatically install everything you need for printing with QuickDraw GX.

- If you installed QuickDraw GX after you set up your Color StyleWriter 2400, you must reinstall the Color StyleWriter 2400 software.
- After you click the Print button to print a complex document, you may notice a delay before you see printer activity.

If printing with QuickDraw GX doesn't produce satisfactory results, you can use the GX Helper utility to turn off QuickDraw GX and use the regular QuickDraw printing software. For more information, see Appendix E of your user manual.

Using the Color StyleWriter 2400 With Application Programs =====

If you have problems printing from a specific program, it may be a problem in that program. If you have problems, contact the publisher of the program. In some cases a newer, more compatible version of the software may be available.

- In some programs—such as Microsoft Word 5.1, WordPerfect 3.0, ClarisWorks 2.0, and Symantec GreatWorks 2.0—rotated text created within the program may print with jagged edges. For best results, create the rotated text in another program and paste it in.

Notes About Specific Programs -----

The following list describes some special situations that you should be aware of when working with specific programs. (There may be other problems with these programs or with other programs not mentioned in this document).

AdobeType Manager

- When you install version 3.8.1 or later of Adobe Type Manager, some system fonts are removed from your system and placed in a folder called "De-installed Fonts1." If you later turn off ATM, drag all the fonts in the "De-installed Fonts1" folder back into the Fonts folder inside the System folder to prevent characters with jagged edges.
- If you rotate Adobe Type 1 fonts in FreeHand 3.11 and then paste them into another program, your Macintosh will display a system error when you try to print.
- If you print rotated Adobe Type 1 fonts using FrameMaker 4.0, your Macintosh will display a system error.
- If you print rotated Adobe Type 1 fonts that are also bold or italic using

Intellidraw, and text will not print, you probably need to upgrade to ATM version 3.8.1.

- If you get incorrect output when you try to print rotated and flipped Adobe Type 1 fonts, try using a TrueType font instead.
- When Adobe Type 1 fonts are both outlined and underlined, characters may be misprinted (incorrect locations, multiple characters in same location, lower portions of characters shift left or right).

Adobe Dimensions

- Always print your documents in the foreground when using Adobe Dimensions. To turn background printing off, open the Chooser, click Off for Background Printing. If you accidentally print in background and your Macintosh crashes, you may have to restart with extensions off, open your desktop printer and drag all print requests from the queue.

Adobe Illustrator 5.0

- Unless you have at least 10 MB of free disk space on your startup disk, you will see a "disk is full" error message when you try to print. The more complex the document, the more space you need.
